There are many excellent feeds on the market, the price of which is more or less in accord with their nutritive value. These should be bought, rather than chop feeds, to supplement the home grown feeds and fodders. At the best, chop is but a low-grade feed. If necessity occasions the purchase of the chop, careful examination of the proffered feed is important; unless finely ground those containing an excess of hull can be readily distinguished by the experienced farmer.

BURYING LARGE WEEDS

When a person is plowing under larg weeds or is plowing under some green manure crop, and wishes to completely turn it under, attach a chain to one end of the doubletree and carry back to the plow beam, just above the moldboard. Then attach a second chain to the first one near the plow point and let drag in the furrow. The plow in cutting the ground throws the dirt over on to the second chain and this keeps the first chain always held down to the ground, which will then pull under any weeds. If not for the second chain, any heavy weed would throw the first chain up and the weeds will pass under.—R. L.

While He Is Away

Perhaps your hired man has enlisted, or your son has gone to the front. Or perhaps you are keeping much more stock and growing much larger crops, and there is too much work for you. The Government tells us that this is the best way to help win the war.

BT Manure Carrier Will Help You

It makes the chores twice as easy, for it cuts right out the hardest part of them. It cuts out the drudgery of cleaning the stable with a wheelbarrow.

BT

MANURE CARRIER
Will Do Your Stable Cleaning

It will take out four wheelbarrow loads at once. In one trip or two trips at most you clean the stable. 5 or 10 minutes does the job.

Wide-mouthed bucket drops close to the gutter and you can throw in liquid as well as solid manure without stopping it over. You can push the bucket along from stall to stall with your fork, until you have your load.

No heavy lifting. No hard pushing. The carrier runs on a level overhead track, right over mud or snow, to the pile far from the barn.

CHOP FEEDS

(Experimental Farms Note)

The term "chop" or "chop feeds" is a general one used to denote a class of feeds which are essentially oat products. Mill feed, cattle feed, oat feed, moulee chop are common names for these feeds used by the local grist mill, while some of the larger mills put out this product in quantities under specific brand names. Certain of these feeds consist entirely of crushed or ground oats, others consist almost entirely of the by-products of the oat meal mill (including oat hulls) while others contain a certain admixture of corn, barley, etc. They are extremely variable in composition. The Commercial Feeding stuffs Act, under the administration of the Department of Inland Revenue does not require any registration of chop feeds nor any guaranty as to their percentages of protein, fat and fibre. However, the "Adulteration Act" has established a standard of quality for certain grain products and it states that "Chop Feed is whole grain of one or more kinds more or less finely ground, and contains not less than ten (10) per cent protein, not less than two (2) per cent of fat and not more than ten (10) per cent of crude fibre." All chop feeds not carrying a guaranty as to nutritive value (minimum percentages of protein and fat and maximum percentage of fibre) ought to conform to this established standard or be considered adulterated.

The correspondence of the Division of Chemistry during the past year has contained many complaints regarding these chop feeds. In certain cases it was stated the feed was refused by all classes of stock and only eaten with repugnance after being mixed with bran or middlings. In any other cases, persistency in feed the material resulted in the death of swine, calves and poultry, apparently partly from starvation and partly from digestive disorders brought on by the low nutritive value of the food and its coarse, fibrous nature.

A few samples of these feeds respecting which complaints had been made, were collected in Ontario, Quebec and British Columbia, and submitted to analysis in the Experimental Farm laboratory.

While it is not claimed that these analyses were typical of chop feeds as sold generally throughout the Dominion, it is highly significant that not one of the seven samples examined contained the minimum percentage of protein required by the standard, that they were all exceedingly low in fat and that they with one exception contained an excess of fibre three of them over 20 per cent. Taken as a series they were of extremely low feeding value and several of them were practically worthless.

These feeds ranged in price from $20 to $35 per ton. In a few of them there was a sprinkling of corn, but in the majority of them the proportion of meal was very small; they were all coarse and fibrous, indicating that they had been largely made from light oats or contained a heavy admixture of oat hulls, mill waste and other worthless offal. Some of them contained a number of weed seeds, fragments of straw, etc. There is no wonder that stock refused them. Indeed it is well nigh impossible to imagine how they could be used profitably, if purchased at any price.

Ground or crushed oats from good quality grain make a nutritious feed though for young pigs and calves the hulls should be sifted out. While not a high-protein concentrate, it possesses many excellent qualities as a basis of the meal portion of the ration. Of all the cereals, oats are the most readily and successfully grown throughout Canada, and there is no reason why the progressive farmer with foresight should not be independent of these purchased chop feeds. With a grain grinding mill on the farm, there should be little necessity to buy chop.

There are many excellent feeds on the market, the price of which is more or less in accord with their nutritive value. These should be bought, rather than chop feeds, to supplement the home grown feeds and fodders. At the best, chop is but a low-grade feed. If necessity occasions the purchase of the chop, careful examination of the proffered feed is important; unless finely ground those containing an excess of hull can be readily distinguished by the experienced farmer.

THE REGULAR COURSE

AT THE

College of Agriculture

Truro, - Nova Scotia

Commences October 31st Next

THIS COURSE offers an opportunity to study the fundamental principles of INCREASED PRODUCTION which, second only to fighting, is the Paramount Need of Canada today and which will be of preeminently first importance after the war. The young farmer who is not in a position to go to the war should not miss the opportunity of Preparation which the course at Truro offers.

Tuition free to Students from all the Provinces of Canada. Write for Calendar to

Volume 23. SUSSEX, NEW BRUNSWICK, OCTOBER 23, 1917. Number 2.

Workable Suggestions for N. B. Agricultural Societies

The Agricultural Societies in various sections of the Maritime Provinces will soon be holding their annual meetings. A live Agricultural Society is of inestimable value to a community. The following communication has been forwarded to the various Agricultural Societies in New Brunswick by M. A. MacLeod, Superintendent of Agricultural Societies. Think over the various ideas suggested and go to your annual meeting prepared to take an active interest in the work.

Communication to be read at the Annual Meetings

To Officers and Members of New Brunswick Agricultural Societies:—
Gentlemen:

You are this day assembled to review the work you have accomplished as an organized body of farmers during the Agricultural year now drawing to its close, (November 30), and to make provision for progress in your calling during the year that begins on December 1st.

The New Brunswick Department of Agriculture trusts you may be able to look back with pardonable pride to the work you have been enabled to accomplish, and hopes your deliberations this day may rebound with profit to yourselves and the community you serve.

There are a few matters I would like to bring to your attention with the view that you may possibly see your way clear to act on as many of them as you may deem advantageous to the cause of Agriculture in your District, or that would put you in better shape as an organization, through whom the Department of Agriculture can be of the utmost service to the farmers of your locality.

The following suggestions are not written to weary you, nor for the purpose of just giving expression to vague thoughts. They are passed on to you, a group of progressive farmers, as workable suggestions that have been the means of building up the most energetic Agricultural Societies we have in the Province. You may possibly be working along one or more of the ilnes suggested—I hope you are—it may be that you also have ideas that would be of service to other Agricultural Societies. The Department of Agriculture will be very glad to receive helpful, workable ideas from you at any time and will, in as far as it possibly can, put them into practice. Let us all work together to accomplish results for one common cause.

1. Appoint the most efficient men you have in your midst for your officers, regardless of creed, color or political affiliations.

2. Having appointed your officers do not let the burden of the work rest too heavily upon them—let the rank and file of the members assist wherever they can.

3. Make a thorough canvass of your district for new members. It is a good plan to appoint a committee that will put on a regular whirwlind campaign to end up on a certain date, before December 1st, to do this work.

4. Remember that the Agricultural Society is the strongest and most efficient organization, through and by which the Department of Agriculture can best serve the interests of an Agricultural community. Consequently the more farmers you can get, the more efficient and helpful will your work and that of the Department of Agriculture become to the very classes you and they are striving to benefit.

5. If you have any suggestions to offer to the Department of Agriculture, we will be pleased to receive them, and if feasible act on them.

6. Do you need seed and grain in your district for the spring of 1918? Club your orders together early in the New Year, and let us know your total wants. The Department can put you in touch with the best firms from whom to buy.

7. Do you need fertilizers? Get your orders together without delay. We will put you on the right track.

8. Do you need ground limestone? The Department owns a lime stone pulverizing machine. Can you use it in your vicinity? Let us hear from you.

9. Did you harvest a crop of ripe clover hay? If so, you want the services of the Government Clover Huller. It is available. You know it pays to sow good clover seed. You can grow it yourselves. If you are not prepared for the Huller this year, why not plan for some work for it in your vicinity next year.

10. Do you know that farmers who sold their wool clip co-operatively in the summer of 1915, 1916 and 1917, received a bigger price per pound for the product unwashed than some farmers got for the clip tubwashed? If there are sheep raisers in your district, it will interest them to know that they will have an opportunity to dispose of their wool co-operatively in 1918. Ascertain the approximate quantity that your members will have for sael. Ask for information.

11. In some sections of Prince Edward Island and Nova Scotia, the members of Agricultural Societies sell their lambs co-operatively, at prices greatly in advance of those received by farmers who do not sell co-operatively. Would your sheep raisers consent to hold their lambs and all sell together on a set date, knowing that they would receive the very best possible market prices?

12. Is there some land in your districts that requires underdrainage? The Traction Ditcher owned by the Government is available. Get information from the Department about it.

13. Encourage as many of your members as have not already set aside the seed required for next spring's seeding, to do so at their very earliest opportunity. If there is a shortage, let us know, as stated in paragraph, early in the New Year. If any of your members have a surplus of good seed grain, of any kind, let us know so that we may put farmers not so forutnate, in touch with a source of supply.

14. Are you giving your pure bred sires the care that the prices you paid for them, and their value in increasing the usefulness of your herds and flocks warrant?

15. Are your sheep owners troubled by dogs? The act passed by the Legislature of the Province last winter gives redress. Have you a copy of the Act on file? Get one from the Department.

16. Do you want pure bred sires? Get in touch with the Department. Find out all about how cheaply your wants can be supplied.

17. Do you want some qualified practical men to address one of your meetings on any particular subject—ilvestock, horticulture, dairying, beekeeping or general farming topics? If so, let us know and we will try to arrange dates with you when one of our men can be with you.

18. Do you encourage your members to take farm papers and Agricultural Literature? It helps to keep them abreast of the times.

19. Do not let politics or other factors enter your organization to disrupt you. Work for and with each other as farmers.

20. Have your reports ready sworn to and forwarded to the Department of Agriculture not later than December 1st, and in this way tidy up the year's work, ready to begin another year with a clean record. Be sure to elect delegates to the New Brunswick Farmers' and Dairymen's Association.

Timely Suggestions

Harvesting operations for 1917 are now practically completed and many of our farmers are well advanced with the work of preparing for the seeding season of 1918.

That the farmers of The Maritime Provinces intend to put forth every effort to "grow things" in 1918, is evidenced by the large areas of land that have been plowed this fall. The plow will be kept at work turning furrow after furrow or two furrows at a time, until Jack Frost prevents further operations on the soil.

Our farmers did their best to heed the call for increased production in 1917. They worked under difficulties that were hard to overcome—scarcity of labor, high priced labor, fertilizers and seeds, and adverse weather conditions. It may be that many of them did not succeed as well as they would wish in 1917, but they must go on to prepare for redoubled efforts in 1918. The call is ringing louder and clearer than ever. Meatless days are here, wheatless days are coming, and many more are the ways in which all classes must curtail and economize before the common enemy is vanquished.

The growing of plants is the one means of exploiting Nature without impoverishing her.

Growing things makes the farmer and the county richer, and yet conserves the future.

Every provident nation encourages its people to grow things.

It means sacrifice, but war times are times of sacrifice, and the farming community is not taking second place to any in its willingness to sacrifice.

Fertilizers are going to be scarce and high, so it is advisable for our farmers to lay in their requirements early in the season.

The seed supply should also be attended to without undue delay. Our most successful farmers follow the practice of seed selection in the field, and many of them have already put aside the best of their harvest for seed purposes. Others neglect the preparation of seed until near the time when they are going to use it. If the field system of selection is not followed, a good fanning mill selection should be made early in the season, and while there are large quantities in the bins from which to select the plumpest and best. What applies to seed grain also applies to the selection of potatoes. Like produces like, consequently only well formed, disease free tubers should be selected. The prevalence of potato diseases during the past season should make this patent to all concerned.

Are the various machines you use in the field thoroughly cleaned, oiled and stored under cover for the winter. It is poor economy not to take good care of the farm implements and machines, even in times when they are less expensive than they now are.

Have you dipped your sheep and lambs to rid them of vermin before putting them in winter quarters? Are you flushing your ewes and thus preparing for a bumper lamb crop next summer? With lambs selling in the vicinity of $10.00 each, every extra lamb counts.

A few pieces of boards or other material to keep out the cold where necessary, may save dollars for you in your feed bill. Don't neglect adequate ventilation.

The Cape Breton Island Exhibition

In no section of the Maritime Provinces has there been more advancement made in the matter of an Agricultural Exhibition than in Cape Breton.

Cape Breton's industries demand a large army of artisans and laborers, and consequently there is a large consuming, well paid public that must be fed. The Cape Breton farmer, who industriously caters to the needs of this splendid market, is reaping a good reward for his labors.

Year by year the quantity of produce that is grown in the vicinity of the Sydneys, is increasing and the necessity for importing from outside sources is being diminished.

The strangers' conception of Cape Breton is that it is a rocky, barren country, where the climate is nine months winter and three months very late in the fall, and where nothing is produced but cod.

The person who is more familiar with conditions in Cape Breton, knows that so far as climate is concerned, the other sections of the Maritime Provinces have nothing on that splendid portion of the Mayflower province, except it be for a week or so in the spring, when the last shreds of the ice floes from the north float along its shores on their way to become liquified in the Gulf stream. He also knows that Cape Breton soil is good and rich, and that while there are no great areas of level land, yet the sloping hillsides are easily worked and yield bountiful arvests.

One had only to visit the Sydney exhibition, recently held. to be fully convinced of Cape Breton's splendid possibilities as an agricultural community.

When the Cape Breton Exhibition was first held, about eight years ago, there was only one pure bred dairy cow shown—a Guernsey. This year there was a showing of nearly one-hundred and fifty head of pure bred Jerseys, Guernseys, Ayrshires and Holsteins, many of which were the equal of representatives of the respective breeds found at some of the larger and older interprovincial fairs.

Why the change? The answer is that some of the most progressive farmers in the vicinity of the Sydneys have made a practice of attending the Short Courses at the Nova Scotia Agricultural College every winter since the classes were first organized. They have also been visiting the provincial and winter fairs, and there learned and seen what other farmers were accomplishing. They invested in a few pure bred sires of the breed of their choice. An occasional pure bred female was from time to time added to their respective herds. The get and progeny of these animals have increased the herds, until as a fitting climax to the whole transaction, the visitors to the Sydney fair found the various breeders—Nicholson, McQuire, The Jacksons, The Munns, Drysdale, The Rosses, Crowdis, McPhee Redmond; Allen, The Moffatts, Oland, McQueen, McKenzie, Earson, several Agricultural Societies and others, competing for supremacy in the ring with a class of stock that would do credit to any breeder.

The rapid strides that have taken place in the pure bred classes, also been extended to the grade classes, until no where in the Maritime Provinces is there such a splendid showing of high grade dairy cows, as is found in the vicinity of the Sydneys. The various farmers are consistently breeding along certain lines, and sticking to the breed of their choice. Several prize winners in the dairy classes of the big winter fair have also been purchased and added to the already well established herds.

The exhibition of Dairy Cattle was unquestionably the outstanding feature of the big fair.

The diploma for the best bull, any breed or grade, went to M. W. Ross & Son on the Ayrshire bull, College Peter Pan. A similar honor in the female calss was captured by C. A. Munn & Sons, with their Holstein cow, Mercena Vale De Kol.

The champion Ayrshire female was Blythe 2nd of Springvale, shown by John Redmond.

The Jersey championships went to H. A. Moffatt & Son on their bull, Signor Berni and their female, Josie of Lo Keview.

H. C. Carson had the best Gnernsey female, the calf, Kate of Middle Head.

J. McKenzie's Laurier was the champion Guernsey bull.

The number of entries in the cattle class totalled nearly 350 head.

There were 68 entries in the horse classes, but there was not a great deal to shout about. The most of the horses were at home on the farms, busily harvesting the crops or turning the sod in preparation for next season's seeding.

The best pure bred stallion in the draught class was the Clydesdale, Baron Majestic. In the light horse stallion class the championship went to S. D. Gillis & Son of their Standard Bred Jack Dalton.

The sheep entries numbered 122 head. the majority of which were out in ordinary field fit. There were some pure bred Leicesters, Cheviots, Oxfords, Southdowns and Hampshires,, but no Shrops. There are more Shrops in Cape Breton than any other breed, and it is up to the Shrop breeders to pull themselves together, get out to the fair and see what they can do. There is a big demand for Shropshire breeding stock and farmers, who own a flock of pure breds and who do not try to cater to the demand, are letting easy money slip through their fingers.

The Swine numbered 49. Berkshires, Yorkshires and Chester Whites were represented. It was a regular walkover in each class, owing to lack of competition.

The poultry show at Sydney was very slim, owing to the fact that the accommodations for showing poultry is very poor, and the various poultry breeders bycotted the show and will continue to do so, until they are given better quarters.

Next to the dairy cattle sections, the display of vegetables was the most outstanding feature of the show. There was a profusion of well grown specimens in every section, ample testimony to Cape Breton's claim for productiveness. The fruit exhibit, although not so extensive as at the provincial fair, was well staged and in a better stage of maturity. the latter undoubtedly owing to the later season.

Apples, clean marketable apples, can be produced in Capt Breton.

The Boy Scouts' under their motto, "Be Prepared", made a creditable showing of garden produce, that showed what young hands can do to help produce food and win-the-war.

The Ladies and Domestic Departments were well filled, and the work compared very favorably with that done by the aldies of the other provinces.

The weather man was quite favorable to the show, and the attendance was all that the management could expect.

The Nappan Experimental Farm had an educational display along the same lines as that put on at the other fall fairs.

The N. S. A. C. also had a booth similar to the one they had at the Halifax exhibition.

Both of these features were well patronized, and the work of the two institutions was brought closer to the rank and file of the farmers, who do not get away to visit these educational departments as often as they would like.

Cape Breton is a hive of mines and manufacturing industries, all of which call to the farmers for more food production to feed the non-producers that are necessarily employed therein. The farmers are alive to the demands and the Sydney Exhibition is doing good work in stimulating the laudible desire to excel. Go it Cape Breton Farmers, yours is as good a heritage as one will find anywhere on the Globe.

Cow, over 3 under 4 years—1, R. M. Jackson.

Cow, over 2 and under 3 years—1, R. M. Jackson.

Heifer, over 2 and under 3 years—1, H. C. Corson.

Heifer, over 18 months, up to 24 months—1 and 2, R. M. Jackson.

Heifer, over 12 months, up to 18 months—1, R. M. Jackson.

Heifer Calf, over 6 months, under 1 year—1 and 2, H. C. Corson; 3, Jack McKenzie.

Heifer Calf, under 6 months—1, R. M. Jackson.

Best Bull, any age, Diploma—Jack McKenzie.

Bull and 3 of his get, Diploma—Jack McKenzie.

Cow and 2 of her progeny, Diploma—R. M. Jackson.

Herd—1, Jack McKenzie.

Breeder's Young Herd—1, R. M. Jackson.

Best Female, Diploma—H. C. Corson.

Grade Jerseys

Cow, 4 years and upwards—1 and 2, Walter Drysdale; 3, S. D. Gillis & Sons.

Dry Cow, 4 years and upwards—1, J. Webster Allen; 2, Jack McKenzie; 3, Alex. K. Jackson.

Cow, 3 years old—1, H. A. Moffatt; 2, M. W. Ross & Son.

Dry Cow, 3 years—1, S. D. Gillis & Sons; 2, Nelson Beaton.

Cow, 2 years—1, A. Drysdale, Sydney; 2, Walter Drysdale.

Heifer, 2 years—1, Geo. D. Oland; 2, S. D. Gillis & Sons.

Heifer, over 18 months, up to 24 months—1, J. Webster Allen.

Heifer, over 12 months, up to 18 months—1, H. A. Moffatt; 2, Geo. D. Oland.

Heifer, 6 months, under 1 year—1, J. H. McLean, Jacksonville.

Heifer, under 6 months—1, John McMullen; 2, J. P. Harvey; 3, C. A. Munn.

Grade Guernseys

Cow, 4 years and upwards—1, H. A. Moffatt; 2 and 3, John W. McQueen.

Dry Cow, 4 years and upwards—1, J. H. McLean; 2, Alex. K. Jackson.

Cow, 3 years—1 Jack McKenzie; 2, John McMullen.

Cow, 2 years—1, D. R. Nicholson.

Heifer, 2 years—1 and 2, Jack McKenzie.

Heifer, over 18 months, up to 24 months—1, Jack McKenzie; 2, C. A. Munn.

Heifer, over 12 months, up to 18 months—1, Geo. D. Oland; 2, John W. McQueen.

Heifer, 6 months, under 1 year—1, C. A. Munn; 2, Jack McKenzie.

Heifer, under 6 months—1, J. H. McLean.

Grade Ayrshire

Cow, 4 years and upwards—1, J. W. Allen; 2, Arthur R. Richardson, South Bar; 3, M. W. Ross & Son.

Dry Cow, 4 years and upwards—1, John Remond, North Sydney; 2, A. Drysdale; 3, S. D. Gillis & Sons.

Cow, 3 years—1, Arthur R. Richardson; 2, S. D. Gillis & Sons.

Dry Cow, 3 years—1, J. P. Harvey, George River.

Cow, 2 years—1 and 2, Arthur R. Richardson; 3, S. D. Gillis & Sons.

Heifer, 2 years—1, 2 and 3, Arthur R. Richardson.

Heifer, over 18 months, up to 24 months—1, John McMullen; 2, A. Drysdale.

Heifer, over 11 months, up to 18 months—1, Wilson Gillis; 2, Arthur R. Richardson; 3, S. D. Gillis & Sons.

Heifer, 6 months, under 1 year—1, Geo. O. Oland; 2 and 3, A. J. McLeod, South Bar.

Heifer, under 6 months—1, Geo. D. Oland; 2, C. A. Munn; 3, S. D. Gillis & Sons.

Cow, 4 years and upwards—1, D. R. Nicholson; 2, C. A. Munn; 3, John W. McQueen.

Dry Cow, 4 years and upwards—1, 2 and 3, D. R. Nicholson.

Cow, 3 years—1, Alex. K. Jackson; 2, John W. McQueen; 3, C. A. Munn.

Dry Cow, 3 years—1, Jas. McGuire.

Cow, 2 years—1 and 2, D. R. Nicholson.

Heifer, 2 years—1, C. W. Totten; 2, C. A. Munn; 3, John W. McQueen.

Heifer, over 18 months, up to 24 months—1, D. R. Nicholson.

Heifer, over 12 months up to 18 months—1, Geo. D. Oland; 2, John W. McQueen; 3, Nelson Beaton.

Heifer, 6 months, and under 1 year—1, D. R. Nicholson; 2, C. A. Munn; 3, Alex. K. Jackson.

Heifer, under 6 months—1, Geo. McKeagan, Coxheath; 2, Alex. K. Jackson; 3, Geo. W. Oland.

Grade Herds

Best herd of 5 cows, three over 2 years—1, D. R. Nicholson; 2, John W. McQueen; 3, Arthur R. Richardson.

Best Herd 4 Heifers, under 3 years—1, D. R. Nicholson; 2, S. D. Gillis & Sons; 3, Geo. D. Oland.

Best Bull, any age or breed (dairy cattle), Diploma—M. W. Ross & Son.

Best Cow, any age or breed, in milk or calf, Diploma—C. A. Munn & Son.

SHEEP

Leicesters—Pure Bred

Ram, 2 years old or over—1, John McKeigan, Mineral Rock; 2, Eldridge Hill, Pt. Eward.

Ram, Lamb—1, Eldridge Hill.

Ewe, 2 years and over—1 and 2, Eldridge Hill.

Ewe, lamb—1 and 2, Eldridge Hill.

Pen, one Ram, two Ewes, two Ewe Lambs—1, Eldridge Hill.

Cheviots

Ram, 2 years or over—1, Wilson Gillis, Georges River.

Ram, over 1 and under 2 years—1, Wilson Gillis; 2, Murdoch A. MacLeod, Loch Lomond West.

Ram, Lamb—1, Murdoch A. MacLeod.

Ewe, 2 years or over—1 and 3, Wilson Gillis; 2, Murdoch A. MacLeod.

Ewe, Lamb—1 and 2, Wilson Gillis.

Pen, 1 Ram, 2 Ewes, 2 Ewe Lambs—1, Wilson Gillis.

Southdowns

Ram, 2 years or over—1, W. M. Hill, Pt. Edward.

Ram, over 1 and under 2 years—1, W. M. Hill; 2, John McMullen, Georges River.

Ram, Lamb—1, W. M. Hill.

Ewe, 2 years or over—1 and 2, W. M. Hill; 3, John McMullen.

Ewe, over 1 and under 2 years—1, and 2, W. M. Hill; 3, John McMullen.

Ewe, Lamb—1, 2 and 3, W. M. Hill.

Pen, 1 Ram, 2 Ewes, 2 Ewe Lambs—1, W. M. Hill; 2, John McMullen.

Oxfords. All prizes in this class taken by E. J. Johnson, Georges River.

Dorsets

Ram, over 1 and under 2 years—1, J. P. Harvey, Georges River.

Ram, Lamb—1, J. P. Harvey.

Hampshires

Ewe, 2 years and over—1, D. J. McKenzie.

Ewe, over 1 year—John McMullen.

Ewe, Lamb—John McMullen.

Pen—John McMullen.

LONG WOOL

Grades and Crosses

Ewe, 2 years or over—1 and 3, John McKeigan, Mineral Rock; 2 Nelson Berton, Coxheath.

Ewe, over 1 year—1, John McKeigan.

Ewe, Lamb—1 and 2, Nelson Beaton; 3, John McKeigan.

Pen, 2 Ewes, 2 Ewe Lambs—1 and 3, John McKeigan; 2, Nelson Beaton.

MEDIUM WOOL

Grades and Crosses

Ewe, 2 years and over—1 and 2, J. P. Harvey, Georges River; 3, E. J. Johnson.

Ewe, over 1 year—1, Geo. McKeigan; 2 and 3, D. J. McKenzie, Balls Creek.

Ewe, Lamb—1, J. P. Harvey; 2, Geo. McKeigan; 3, D. J. McKenzie.

Pen, 2 Ewes, 2 Ewe Lambs—1, D. J. McKenzie; 2, J. P. Harvey; 3, Geo. McKeigan.

Fat Sheep

Fat Ewe—1, Chas. E. Lewis, Coxheath; 2, E. J. Johnstone; 3, Geo. McKeigan.

Fat Ewe Lamb—1, J. P. Harvey; 2, Geo. McKeigan; 3, Nelson Beaton.

Fat Wether Lamb—1 and 2, E. J. Johnstone; 3, John McMullen.

SWINE

All prizes in Berkshire and Yorkshire breeds were taken by Geo. D. Oland, Coxheath and all prizes in Chester Whites by D. R. Nicholson, Coxheath.

December 4-18

GOOD FELLOWSHIP WATCHWORD THAT LEADS TO SUCCESS

Unselfishesness in community interests is one of the most commendable traits in business ethics. In any country neighborhood, town or suburban district there are always some indivuals who are in a better position, financially or from other causes, to lead in the various enterprieses of the locality, and if these are truly cosmopolitan and so conduct themselves as to help others less fortunate than themselves, instead of ignoring them altogether or what is worse, giving them a "cut behind," or a knock on the sly, th ecommunity spirit will be greatly enlarged and the individual not only benefited himself but resultst in being a real benefactor to humanity.

Selfishness isolates men and he wh ois domi.. ated by this principle cares not for his fellow beings so long as he can steer his own craft clear of accident and land into his coffers another bag of gold. Unhappy indeed, is the community with characters of this type in it. Their own lives having been degraded to the mere fact of money making and greed tends to hold all others down to their lo wlevel of ambitionn.

The spirit of a community should take into consideration the principle of the Golden Rule, which will not only not kick the man that is down, but at least, will give the word of encouragement where needed and thus foster and develop general good fellowship not only with immediate neighbors but also to others with whom they come in contact both in a business and social relationship.

To this end residents of any section should cooperate for one another's good. When by any means one neighbor comes to find ut certain information of general interest by which both he and his fellow farmers can benefit, he should pass the good word along and give them also an opportunity to profit as well as himself. Many on the contrary keep all such information to themselves, hoping thus to get the start of the other fellow and bring himself into greater prominence even though the knowledge passed on would in no way interfere with his own success.

As one in the line of breeding registered stock, or in any other commendable enterprise, he should be tooo big a man to have any secrets that will stand in the way o fhis neighbor's accomplishment, but on the contrary by making use of community interests and general knowledge one should seek to advance the benefits of all to the disadvantage of none.

As a matter of fact, the principal of justice and good fellowship will work out in the end to the advantage even of the selfish man. In the last analysis it is only the worth while things that count. Financial advantage gained by taking an unworthy advantage of one's neighbor, whether it be by "doing the thing tht should not be done" or by "leaving undone the thing that should be done" will make little difference; the principle in either case is condemned by moral equity, and sooner or later the result will be disappointment and even punishment to the offender.

The breeders of registered cattle should at have the interests of the breed as a whole at heart as well as their own private herds. If this is not done and the general excellence of the breed kept in the forefront, even at the cost of individual effort and sacrifice the word decadence must soon be written over the door psts of the Association Hall, no matter what the breed or the men behind it.

Wonderful results can and have been accomplished by united effort and harmonious action, but jeaulousies, wranglings, intrigues, backbitings and the whole list of such things must be eliminated by its members if an association is to be brought up and maintained at its highest sphere of usefulness.

In no other way can excelsion be written upon the banners of any worthy organization or success crown the efforts of those who would win laurels for their favorites, and multiply their values in the service of humanity.

HANNA'S APPEAL

The first statement issued by the new Canadian food controller sounds like real business. But doubtless it will be a surprise to those who have been demanding in vague and general terms that "somebody" do something, and who have imagined that the sole duty of a director of Canadian food supplies was to fix prices which consumers could regard as reasonable.

Hon. Mr. Hanna points is finger at "somebody." And behold it is you, and you, and us Thou shalt not waste any food; thou shalt not eat any storable food when perishable foods are available; thou shalt abandon luxurious living. These are his commandments to the Canadian people. They are put now as a voulntary appeal; but if they are not obeyed under voluntaryism they will have to be enforced by legislative war measures —by conscroption if you like the word.

For— .. ..

(1) It is the imperative duty of Canada to create an exportable surplus of food in order that the people of Britain and the armies fighting for us at the front may be fed;

(2) One of the surest ways of reducing food prices in Canada is to reduce the demand for food supplies—a demand largely create by wanton waste and a luxurious scale of living.

Hon. Mr. Hanna is a strong, forceful man. He ha s been assigned a great task. He is going at that task as a strong and forceful man would go at it. He is working in partnership with another big man and ally at Washington.

Hon. Mr. Hanna is going to bring te war home to the Canadian people. He is going to impress upon them the duty of INDIVIDUAL SERVICE.

THE NEED OF HASTE

France has borne her great losses with remarkable fortitude, and it is only now, after three years of bleeding and when the limit of her man power is about reached, that she is crying out for help. The other day the Ottawa Valley Journal printed extracts from an articles by an American writer telling of the extent to which the manhood of France had been exhausted. The writer decalred that France had men enough left to hold on for a few monnths longer only. At a Red Cross meeting in New York the other day Mrs. August Belmont read a letter received by an American from a Frenchman at St. Just which throws further emphasis upon the need of immediate assistance for the French army. In part the letter reads:

> You ask us to wait for you—how long a time? We shall wait for you; that goes without saying. One can ask everything of our soldiers except not to get themselves killed; but if you delay longer, how many Frenchmen will there be left—old men like me, children of 15 years of age, and hardly these. Take care, lest the French nation be nothing but a remembrance, a glorious rememberance.
>
> France will never perish; but the French, what of them? The blood of France is flowing in torrents. Oh, the killed, the mutilated, the wrecks due to German infamy! Certainly, I am aware of the great difficulties that exist in arousing a population that contains so many Germans and Austrians as the United States; and it shall be to the eternal glory of yourselves and of those who are like you to have given this impulse to your country. But hurry up!

France must be saved. She is looking to America, to the United States and to Canada, to fill the vacana places in the long line that is holding the Germans back.

CONDITION AND FLESHING IN SHOW RING

Complaint is frequently made that condition and fleshing count for too much in beef cattle classes in the show rings, that fat very often covers grave defects in form and gives an erroneous impression of substance. To all of which the best answer is that the supreme function of beef cattle is to produce beef and alleged representatives of any of the beef breeds that come to the judging ring sparse of fleshing, lack in an important particular in which the judge desires information and by right should be turned down in competition with animals more thickly covered.

Fleshing is one of the prime essentials in beef cattle. They are fashioned to carry beef evenly, thickly and smoothly in those parts of the carcass where beef counts for most in cents per pound. If they are not carrying a fair abundance of fleshing, there is no assurance that they will be able to. There is a great difference between individuals in this ability to form fleshing. An Angus or a Shorthorn without evidence of it is only slightly better qualified to be rated as a beef animal than is a Holsetin orán Ayrshire.

* * *

What we will do on any great occasion or opportunity depends largely upon what we are. And we are largely what we have made ourselves.

AN OLD FARM BUILDING CAN BE MADE GOOD WHEN GIVEN A NEW FOUNDATION

Many old barns are today almost as sound and weatherproof as when they were built—above the foundations, but seldom secure below the sills, owing to the inferior materials then available. In old buildings most foundation walls were made of rubble masonry—undressed field stone, laid up either dry or with a lime and sand mortar that frequently crumbled and fell out, leaving the greater part of the strength of the wall dependent upon the weight of the building to bind the stones together.

Farm sheds are often supported on posts, with or without sills, blocked up with loose stones. Weeds grow round the base of the shed, or manure is piled against the walls, confining the moisture, and the bottoms of the posts soon rot away; in time the building is askew or maybe it collapses. Drainage from the stable floor is also very hard on barn sills, especially it the floor is located close to the ground where there is insufficient ventilation, as is usually the case with old barns.

Once the sills decay or the foundations start to crumble the building is doomed to a gradual racking and disintegration, unless steps are taken to remedy the defects. It is economy to renew or strengthen defective foundations at the earliest opportunity; many otherwise derelict outbuildings have been saved in this manner.

Concrete is the best material with which to make these repairs, not only because it is the easiest to handle for any purpose, large or small, and because it is durable and inexpensive, but because a first-class job can be done by the farmer, with the help of his own farm labor, at odd times.

Below ground, earth walls are usually firm enough to act as forms; above ground the forms will have to be made of wood. Plan the forms so there will be no difficult measurements to remember, and make them strong enough to hold the concrete without bulging out of shape.

If the posts or sills of a building are badly rotted away, or the foundations have crumbled and been displaced so as to cause settlement, it is usually better to take the old sills and loose portions of the foundations out entirely and build a concrete wall up to the proper height to take their places. To do this, first support the building by temporary struts alongside the posts to be repaired. A couple of jackscrews will be a great convenience in erecting this underpinning or shoring, but if these are not available the work may be done very nicely by the use of wedges.

When the building is underpinned it should be elevated to straighten and correct any settlement. When this is done and the operator is assured that the underpinning is securely held, saw off the posts above the rotten part and cut away the sills and other defective material; also remove any loose stones in the masonry, even though it may be necessary to take out the greater part of the old foundation wall. Next, set in place the forms for the concrete and have them extend to the level of the new sill, which is not put into place until arter the concrete is poured, thus affording plenty of room for this work.

The bottom of the wall should be about fifteen or eighteen inches thick —made larger than the top, which narrows to ten or twelve inches, by sloping one side of the box form. Leave the forms in place for one week, and after two weeks, when the concrete should be thoroughly hard and after the new sill has been inserted, remove the struts which have been used as temporary support.

Concrete for this work should be mixed in the proportion of one part cement, two parts clean, sharp sand and four parts crushed stone, pebbles or cinders, measurements by volume. The stones or pebbles should not exceed two inches in diameter, and best results are obtained by the use of a mixture of sizes graded from one-half to two inches in diameter, in which case the spaces or voids between the stones or pebbles are reduced and a more compact concrete is obtained. Use a coarse sand, otherwise more cement will be required to insure a dense mixture. The ingredients should be thoroughly mixed in a dry state; then water should be added while the mass is turned over until it is of a mushy consistency.

As little time as possible should elapse between the mixing and the placing. After the concrete is in the form it should be tamped lightly with a wooden or iron tamper or rammer, until the water shows on the top and no stones are left uncovered by the mortar.

Sometimes the stone foundations of a building are in a badly weathered or crumbled state, but not weakened to the point of causing settlement, and perhaps the sills and other framework are perfectly preserved. If exposed to the weather much longer such walls are almost certain to disintegrate and collapse. On the other hand, perhaps conditions do not seem to warrant underpinning the building and replacing the old foundation with a new concrete wall. Then the old masonry may be strengthened and dressed with a facing of concrete, and thus made as strong as its original construction.

On each side of the wall, about three inches from the normal face of the masonry, erect forms. Fill these spaces with a fairly wet mixture of concrete, so that all voids in the old masonry are thoroughly bonded together. Tamp the concrete until it comes up flush with the bottom of the sill to the entire width of the wall, and after it has become fairly hard the outer edge may be beveled to act as a water table.

The forms for this job should be built in sections, and moved from place to place as the work progresses. The concrete should be mixed in the same proportion as that used for the wall, but it is advisable to use smaller stones or pebbles, preferably three-quarter-inch material, so that they may enter the crevices and holes in the masonry.

FOOD ADULTERATION MAY RESULT IN STIFF FINES

While there have been quite a number of cases in Ottawa of violation of the pure food laws, this city has not been guilty of any very flagrant breaches o fthe act. There seems to be a steadily growing appreciation of the necessity of a rigid enforcement of the act. Manufacturers and dealers, as a result of the educational work that has been carried on, prefer to handle only pure food.

Aertain amount of adulteration is always going on but this is not an offence if the adulteration is not injurious to public health. The Pure Food Act defines very clearly what criminal adulteration consists of and gives the penalties, which for fire offences usually are fines ranging from $25 to $50.

Provided adulteration is not injurious to public health, it often tends to lower the cost of living as the honest dealer can not command as high a price as he would for the genuine article.

Part of the act governing adulteration which follows will be found interesting to those not familiar with it.

Adulteration

Food shall be deemed to be adulterated within the meaning of the Act:

(a) If any substance has been mixed with it so as to reduce or lower or injuriously affect its quality or strength;

(b) I fany inferior or cheaper substance has been substituted wholly or in part for the article;

(c) If any valuable constituent of the article has been wholly or in part abstracted;

(d) If it is an imitation of or is sold under the name of another article;

(e) If it consists wholly or in part of a diseased or decomposed or putrid or rotten animal r vegetable substance, whether manufactured or not;

(f) If it contains any added poisonous ingredient or any ingredient which may render such an article injurious to the health of persons or cattle consuming it;

(g) If its strength or purity falls below the standard, or its constituents are present in quantity not within the limits of variability fixed by the Governor-in-Council as hereinafter provided;

(h) If it is so colored or coated or polished or powdered that damage is concealed, or if it is made to appear better or of greater value than it really is;

(i) In the case of milk or butter, if it is the produce of a diseased animal or of an animal fed upon unwholesome food.

Offieces and Penalties

Every person who wilfully adulterates any article of food or any drug, or orders any other person so to do, shall—

(a) If such adulteration is, within the meaning of this Act, deemed to be injurious to health, for the first offence incur a penalty not exceeding five hundred dollars and costs, or six months" imprisonment, or both, and not less than fifty dollars and osts, and for each subsequent ocence a penalty not exceeding one hundred dollars and costs, or one year's imprisonment, or both, and not less than one hundred dollars and costs;

(b) If such adulteration is, within the meaning of this Act, deemed not to be injurious to health, incur a penalty not exceeding two hundred dollars and costs, or three months' imprisonment, and for each subsequent offence a penalty, not exceeding five hundred dollars and costs, or six months' imprisonment, or both, and not less than one hundred dollars and costs.

Every person who, by himself or his agent, sells, offers for sale, or exposes for sale any article of food or any drug, which is adulterated within the meaning of this Act, shall,—

(a) If such adulteration is, within the meaning of this Act, deemed to be injurious to health, for a first offence incur a penalty not exceeding two hundred dollars and costs, or three months' imprisonment, or both, and for each subsequent offence a penalty not exceeding fiee hundred doll ars and costs or six months' imprisonment, or both, and not less than fifty dollars and costs;

(b) If such adulteration is, within the meaning of this Act, deemed not to be injurious to health, incur for each such offence a penalty not exceeding one hundred dollars and costs and not less than five dollars and costs.

DISTRICT REPRESENTATIVES FOR CHATHAM AND WOODSTOCK

Messrs. James Bremner, Jr., ant A. G. Taylor have been appointed to take charge of the Agricultural Offices at Chatham and Woodstock respectively, the former having Northumberland, Restigouche and Gloucester counties, the latter having Carleton, Victoria and Madawaska counties.

Both men are graduates of the Truro Agricultural College and have been employed by the Provincial and Dominion Departments of Agriculture for occasional work and have proved themselves capable to carry on more extensive work for any Department. They will have to do with any agricultural problem before the people, but will give particular study to the practical questions which are always to the fore. Both men are farmers and have had special training in potato work besides the college experience. They will take up their duties about November first.

Mr. Norbert Leger, of Caraquet, will assist Mr. Bremner in Northumberland, Gloucester and Restigouche counties. Mr. Leger was raised upon a farm, educated at Caraquet College and at the Agricultural School at St. Anne de la Pocatiere. Recently he has been managing his father's farm.

No regular assistant will be placed with Mr. Taylor at present, but occasional assistance will be given him in Madawaska and Victoria Counties.

Mr. James King, with Mr. A. C. Belliveau as assistant, is in charge of Albert, Westmorland and Kent counties, with headquarters at Moncton and a small office at Richibucto. Mr. King is a graduate of the Macdonald Agricultural College, with previous experience at District Representative work. Mr. Belliveau is a graduate of the Truro Agricultural College.

LONGLEVITY IN FARM MACHINERY

The time has come when farmers can no longer afford to invest a few hundred dollars in farm implements, put them in the hands of ignorant and careless operators, and leave them standing in fence corners and under trees from one season to the next, thus reducing their usefulness one-half. Such practise has meant loss to the farmer in two ways, first, because of the unnecessary and rapid depreciation of the implement; second, because the owner, failing to get satisfactory results due to such wasteful practise, failed to appreciate what the machine if properly operated and cared for, would do for him and consequently reverted back to hand labor and such inefficient methods.

Any farmer can make his farm machinery inestment a profitable one by following some system as this: First, learn eery adjustment and the purpose and adantage of each before attempting to operate the machine. Second, oil all bearings, wheels, shafts and other mowing parts where friction will cause undue wear an shorten the life of the machine. Third, keep all bolts and nuts tight and replace broken parts with good duplicate parts, rather than by using some makeshift appliance which only means additional trouble. Fourth, keep the machine in a good implement shed when not in use. A coat of paint applied every two or three years will add to its lasting qualities and general apearance. By following the above suggestions a farmer can get better work out of his implements and have them last from last from two to five years onger—F. R. Jones.

LIVING UP TO FARM'S GOOD NAME

There is a whole lot in appropriateness. Some farmers have been accused of giving very inappropriate names to their farms and those which cause merriment among their neighbors. All farms should be named, but these names should be chosen with some characteristic of the farm in view. Do not try to give a summer-resort name to your farm, any more than you would mis-name a child. Many a child has had to go through life living down to a name instead of up to it. Mike, Peter, Moses, and similar names have brought more embarrassment to more than one school boy. And when the daughter grows up she is inclined to hate the pet name given to her when she was a baby, and when it has been Tiny, Flossie, Dollie or Beauty, she has a perfect right to resent. Many a farm would cry out against its name if it could. Name the farm, to be sure, but make it an appropriate name.

HORTICULTURE

PREPARING COMB HONEY FOR THE MARKET

S. B. Bisbee, Canfield, Ont.

Comb honey has a good market in this country. It commands a much higher price than does the extracted honey. It is, however, more expensive to produce than the extracted product and the margin of profit is not in proportion to the cost of producing it as compared with the extracted honey. It behooves us, therefore, to look after all the means by which the ratio of profit may be enhanced.

The consumer will pay more for a section of honey that is full and clean than he will for an inferior looking section. As the cost of producing an inferior comb is approximately the same as that of producing a better one, it follows that it will be to our advantage to produce a first class grade of comb honey.

The points to be considered in producing a good section of honey are, first, to allow the section to stay in the hive until it has been completely or nearly filled and well ripened; second, to have the comb and the wooden section clean and free from any signs of propolis. This latter, which is the subject of my article, is of importance when a high class trade is desired. The honey must reach the consumer in its most attractive form to command the highest prices.

We will assume that care has been taken that the honey is not mixed—that it, that only clover or buckwheat honey as the case may be, is contained in the super. The finished honey should be removed from the hive soon after the honey flow is over. Otherwise, the wood will have considerable propolis to be cleaned off and the comb will be travel stained. I know of no way in which to remove the stain from the combs. If these are touched, the comb will be broken and the honey will leak out. The wood, however, must be cleaned up and made as presentable as possible.

Before removing the sections from the supers it is well to stand the supers on end where the light will show through. A glance will probably show some light brace combs. A sharp knife run through, will remove these so that the sections may be taken out without breaking the capping, thereby causing a leaky section.

The propolis must be scraped off the wood with a sharp knife. A sheet of sand paper tacked down flat on the table or bench will be found very useful for this purpose.

When the sections have been properly cleaned, the work of grading and packing commences. You may make as many grades as your customers demand. The usual practice, however, is to make only about three grades, fancy, No. 1, and No. 2. The balance of the comb is all classed as culls.

In the fancy grade, I put only sections that are very white and in which nearly all the cells next to the wood are sealed. In the number one grade, I put all sections that are free from stain, with combs well fastened to the wood on all four sides. There should be no pollen cells. The entire outside row next the wood may be unsealed, providing the sections weigh fourteen ounces or over.

I wish to point out here that there is an increasing demand for a No. 1 section with the outside row unsealed. If you have customers who desire this grade of honey, these sections might be placed in cases by themselves and reserved for this trade. It is really the most attractive section of all when placed on the table. When the wood is cut away it leaves a comb without a drop of honey ruuning over the dish. It has not the mussy appearance of the comb that had the outside row of cells sealed.

The number two grade may contain combs not so well fastened to the wood on all four sides. They must not, however, be badly stained. They may have a reasonable number of unsealed cells but must weigh not less than thirteen or fourteen ounces.

The cull honey may be graded to suit the market. My practice has been to make several grades of cull sections, according to weight, and place them with the local merchant to be disposed of. There has always been a great demand for these cull sections. There are always a number of people who do not care to pay the high price now prevailing for number one comb honey.

As the honey is being graded, it should be packed in glass front, no-drip shipping cases. Care should be taken that the combs in the back of the case are in every way equal to those placed next to the glass front.

We have tried putting them up in card-board cartons bearing our name. We abandoned this, however, as we found the bottoms of the cartons became honey soaked or soiled. If we wished to use cartons we would prefer to send the merchant a quantity so that each section, as sold, could be slipped into the carton at the time of sale. However, in the future we will stamp our name on the wood of all sections.

When the cases have been filled, they should be wrapped in paper. A small tack at each end after the paper has been folded, will hold it down. It is not necessary then to tie the parcel with cord.

They should now be placed in crates. If they are to be shipped any distance by rail, a couple of inches of straw or other suitable material should be placed in the bottom to absorb the shock.

Prepare your comb honey for the market as if you yourself expected to be the ultimate consumer. By so doing you will please your customers and your increased returns and the satisfaction which you will enjoy will more than repay you.—S. B. Bisbee in Canadian Horticulturist.

CANKER IN APPLE TREES

Canker is infecting a large number of orchards in Canada, as it is most of the apple-growing sections of the United States. There are a number of different forms of this fungus. In its early stages, canker can be noticed by a region of discolored or sunken bark. In its later stages the bark breaks away. A very common source of infection is through wounds or on the branches that have been winter-killed ,the parasites entering through the injured bark and spreading very rapidly in a single season.

Canker (Sphaeropsis Malorum)

This is one of the common kinds of canker, quite often seen on small branches where dead sections of the bark are noticeable, and it is quite destructive, killing a great many of the smaller branches.

European Canker (Nectria Ditissima)

This canker has a different appearance from the common canker. It usually has a very ugly scar with the bare wood exposed, often leaving the infected part as a large bulge on the limb in the canker area, with the area of the bare wood extending over most of the scar, the bark on the edges presenting a swollen, rough appearance. From the trees that have been winterkilled, all dead branches should be removed, as allowing them to remain on the trees furnishes a source of entrance for the parasites.

Remedy: Cut off all dead branches that are affected by the canker, using implements that have been thoroughly disinfected with copper sulphate (blue vitriol) or with corrosive sublimate solution. Paint all the large wounds with white lead and oil. If there are cankered areas, cut out these areas, cutting at sufficient distance so that none of the infection is left in either the wood or bark.

Inspect your trees carefully, and if there are dead or dying branches on them, see if they are infested by canker, and if so, be sure to have them removed. Burn all the branches removed, whether they are infected by the fungus or not, as the fungus may possibly be on them and thus may spread from them to the living trees. Never allow the ground in your orchard to be littered with the dead brush. Always remember that trees are living things, and as such should always be well taken care of.

The disease may occur at the crotch of the tree, on the limbs, and also on the trunk of the tree. In one of the bulletins of the Maine Department of Agriculture of 1910, we notice that hundreds of orchards were visited in three years, and it was found that none was entirely free from this disease. Since that time, it has had a chance to spread, and it is of the utmost importance that we should take all precautions to check this menace to our orchards.

In our opinion, the well-cultivated orchard is better able to resist the attacks of the fungi that produce canker than are the trees in an uncultivated orchard that are less vigorous and not as healthy. The healthy tree is abel to overcome the effects of the disease much better than a tree that lacks nourishment and is in a stunted condition.

We would advise cutting down badly infected trees, as they are a menace to the others. We do not believe that the badly infected trees can be brought back to a healthy condition.

MARKETING GOODS IN ATTRACTIVE FORM

While quality is an essential requirement in the marketing of any farm and fruit product, it is by no means the only factor in selling at the highest price.

First of all, the package used should be new and clean. The neater the package, the better the fruit will appear. While the products packed should be of uniform size and color throughout the package, the top layer should be arranged so as to attract the eye of the cuyer. Further the package should in every instance be well filled. The buyer is very quick to notice shortness in measure, or any deficiency in a well-topped or rounded finish. In small fruit, such as the strawberry, particular attention should be given to have every berry in perfect condition, with the calyx or hull attached. The individual fruits should not be arranged in layers in the box, nor should the top be arranged to show a uniform red color, but rather, the calyx should show in with the red. For the best effect, and for particular markets where the grower has steady customers, the berries should be graded into two sizes. This is to give uniformity to the fruit, and will make the package more attractive.

It is a well known fact that the attractiveness of a package of fruit sells it. The customers are attracted through the eye, and everything that aids in making the package attractive will increase the value of the fruit and ease in selling.

It does not pay to pack inferior fruit with good fruits, for it invariably works against the reputation of the grower. Too little attention to uniformity in pack and grading will often result in a loss to the grower.

SELECTING BEAN SEED

Every bean grower should take steps to secure good seed for next year's planting, either from his own crop or from fields which he knows to be free from anthracnose and blight. Seed from plants killed by frost before the pods are dry and mature should not be used.

The use of good seed—properly ripened, plump, intact, and free from disease—is essential for securing large yields. It is crop insurance for growers to lay in their seed while there is still opportunity to inspect the fields or they can pick from the cream of commercial stocks instead of having to take whatever may be available later.

EASTLAKE STEEL SHINGLES
WRITE FOR PRICES
METALLIC ROOFING Co. LIMITED.
TORONTO, CANADA.

Seed from carefully selected, clean pods grown in one's own seed plot, of course, are safest. Once the beans have been threshed it is difficult to detect all which have come from diseased pods. It is possible, moreover, in the seed plot by planting the seed in hills and by spraying with Bordeaux mixture to protect the plants from anthracnose, even at an expense not warranted in larger plantings. The grower should see that no one moves among the seed plants while they are wet with rain or dew, when spores of the fungus causing anthracnose most readily are spread.

After the seed is threshed—and this is particularly important in the case of commercial seed—the grower should pick over his seed by hand two or three times and throw out all damaged or diseased beans and those not uniform in size and color. Even commercially hand-picked seed often contains many affected beans. While a few discolored beans are not objectionable for household use, every such seed when planted may spread disease to many neighboring plants. In purchasing beans for planting a germination test should be made and only seed of high quality accepted.

Where a seed plat is used the grower would do well to set aside and store separately with especial care the seed selected for next season's planting.

BLISTER BEETLE AFTER THE BEANS AND POTATOES

The Entomological Branch of the Dominion Department of Agriculture has recently received a number of complaints from farmers and gardeners last season, regarding the ravages of the Ashgray Blister Beetle.

It is important that crops of potatoes and beans particularly be watched for this insect, which has the habit of appearing in large numbers and quickly reducing the crop by feeding upon the foliage. The Ash-grey Blister Beetle is quite different from the well-known potato beetle, being cylindrical in shape, of a uniform ash-gray color, and in length about half an inch. In addition to potatoes and beans, peas, beets, tomatoes, clover, etc., are often attacked by these beetles.

In gardens many of the beetles may be destroyed by beating them from the plants into a pan containing water with a little coal oil on the surface. Under field conditions, however, the beetles are best killed by spraying with Paris rGeen or arsenate of lead. The following formula, which is widely used for the potato beetle, is also valuable for the control of blister beetles: 8 ounces of Paris Green and 1½ pounds of powdered arsenate of lead to 40 gallons of water. If paste arsenate of lead only is available, 3 pounds should be used with the 8 ounces of Paris Green to 40 gallons of water. Both Paris Green and arsenate of lead may be used in the well-known Bordeaux mixture, and if such is done the above proportions are suitable for 40 gallons of the mixture. If it is not convenient to combine the arsenites, use Paris Green in the strength of 8 ounces or more to 40 gallons of Bordeaux mixture or water (if used with water alone add one pound of freshly-slaked lime), or arsenate of lead in the paste form 4 pounds or in the powdered form 2 pounds to the above quantity of water or Bordeaux mixture. In severe outbreaks it is often necessary to repeat the application as the beetles which are killed are soon replaced by others.

As blister beetles are easily disturbed, a remedy which has been successfully employed is for two or three boys, or more if necessary, to walk through an infested plot or field and wave from side to side boughs of spruce or other branches. Such an operation will drive the beetles ahead of them and when the insects come to the edge of the crop they will disperse and seldom return.

If a windrow of straw, hay or any inflammable rubbish is hearby they may be driven into the same and burned in it.

ARTHUR GIBSON,
Chief Assistant Entomologist.

PROSPERITY IS PROMISED

Ottawa, Oct. 22.—The prospect opened up for Canada by the Military Service Act is one of prosperity insured and safeguarded. The object of the Act is to reinforce our men at the front, while keeping in Canada those whose presence here is required in order that necessary business may be carried on as well as those whose going overseas would lay a heavy burden on the country through the needs of dependents.

No heavy tax on the manpower of the country will be made. The Act calls for but 100,000 men, and authorities estimate that there are in the country 400,000 of the first class alone, unmarried men and widowers without children between the ages of 20 and 34. This class may well supply most of those needed.

Men in the first class called will be withdrawn for military service only as they are required by the military situation. The process will be gradual, thus leaving a portion of the men to follow their regular vocations until such time as they are required.

The cost of the war must be reduced to the minimum by the system which sends out of the country only those who can best be spared, from the standpoint of the nation as a whole. General prosperity must also be encouraged by the safeguarding of essential industries and the retention at their work of men whom the highest interests of the country require at home.

Fruit Packages

As the Strawberry season is again approaching, how about your Boxes and Shipping Crates? We make the standard size Box and laso a 32 Box Crate. Order early and insure prompt delivery. Price on application.

TRACTORS SEEN AT PLOWING MATCH HELD AT AMHERST

Beautiful fall weather, following a heavy down-pour of rain Thursday evening, greeted the promoters as well as the large number of agriculturists interested in the tractor demonstration and plowing match which took place at Samuel Freeman's beautiful farm on Lower Victoria street, Amherst, on the 12th. As the morning sun shone out brightly scores of automobiles and carriages came into Amherst from the neighboring districts including many from the county of Westmorland (N. B.), and along about 10 o'clock hundreds of citizens and visitors made their way in automobiles and carriages towards Mr. Freeman's farm, which is one of the finest farming properties in the county of Cumberland. Of course the chief attraction was the privilege to witness the operation of the Ford, Case, International and Waterloo tractors, the latter being quite well known to Amherst as it had been sometime ago contemplated by D. W. Robb, manager of the International Engineering Co., for his plant in Amherst to go into the manufacture of tractors and accordingly the Waterloo had been secured as a model to enable the home industry to take pattern from, but the war changed conditions and Mr. Robb dropped his plans in this respect for the present.

Your paper has already contained a detailed description of the tractors mentioned above, their many advantages being pointed out when they were exhibited at Kentville a few days ago, but it may be said all three viz: the Ford, Case and International were acclaimed with much enthusiasm by the agriculturalists of Cumberland and nearby counties.

The old style plowing match between different farmers coming from different parts of the country and nearby New Brunswick districts was hotly contested and much enthusiasm was manifested by the large crowds present. Each man used his own horses and the prizes were awarded without favor as the judges only knew the lots plowed by numbers, and it can be stated for a fact that no one would despute the decision arrived at by such competent and fair judges as F. L. Fuller and Samuel Moore, of the department of agriculture, Truro. The following were awarded the prizes:

Best ridge, seniors—1st, No. 11, Henry Blankhorn; 2, No. 2, J. Langille; 3rd, No. 5, T. W. Keilor; 4th, No. 12, C. V. Thompson; 5th, No. 8, John Barker; 6th, No. 6, Vetal Richards; 7th, No. 4, Wm. Harkins; 8th, No. 13, A. P. Elderkin.

Juniors—1st, No. 17, Courtney Lusby; 2nd, No. 20, Carl Smith; 3rd, No. 15, Manford Oulton; 4th, No. 18, Elbert Black; 5th, No. 19, Harold Black; 6th, No. 16, Arthur Fitzgerald.

Best finish, seniors—1st, No. 11, Harry Blankhorn; 2nd, No. 12, C. V. Thompson; 3rd, No. 2, J. Langille.

Juniors—1st, No. 17, Courtney Lusby; 2nd, No. 20, Carl Smith; 3rd, No. 15, Manford Oulton.

Ins and outs, seniors—1st, No. 5, T. W. K. Taylor; 2nd, No. 2, J. Langille; 3rd, No. 3, Fred Thompson.

Juniors—1st, No. 17, Courtney Lusby; 2, No. 16, Arthur Fitzgerald; 3rd, No. 18, Elbert Black.

Best crown, seniors—1st, No. 11, Harry Blankhorn; 2nd, No. 2, Lawson Lowe; 3rd, No. 5, T. W. K. Taylor.

Juniors—1st, No. 17, Courtney Lusby; 2nd, No. 20, Carl Smith; 3rd, No. 18, Elbert Black.

Best plowing outfit—1st, No. 20, Carl Smith; 2nd, No. 5, T. W. Taylor; 3rd, No. 8, John Barker; 4th, No. 12, C. V. Thompson; 5th, No. 1, Thomas Hooper; 6th, No. 13, A. Pederskin.

A special prize of $25 open to the two provinces of Nova Scotia and New Brunswick for the best plowing on the field, was won by Thos. Hooper, of Truro. Another special prize, a silver cup, for the best ridge of those competing from Cumberland, donated by W. W. Baird of the Experimental Farm at Nappan, won by Harry Blankhorn, of Nappan; the second special prize, a silver medal, donated by the Canadian Bank of Commerce, was won by J. Langille of Nappan. The ridge work of these two men was commented upon by all as being of a very high order. About 1,500 people attended the demonstration and taking all in all it was a gala day for Amherst.

One would almost have thought that a winter fair was on to see so many happy agriculturists in town, and in the evening the farmers and their friends took advantage of the many bargains offered by Amherst merchants in honor of the occasion. The ladies of the Red Cross looked after the inner man and every one enjoyed a good meal at the farm. To Professor Cumming and Superintendent Baird of the Experimental Farm, great praise is due for the success attending the occasion as well as so many Amherst merchants who generously contributed the prizes, all of which went to make the demonstration and plowing match a genuine success.

CLASSING MEN FOR SERVICES

Ottawa, Oct. 22—Only those men found physically fit for combatant service overseas by the medical boards will be included in the first quotas called to the colours under the Military Service Act. All such men are now being placed by the examiners in Category A.

Men not in flawless physical condition are being classed as to their fitness for war service in non-combatant units, either in Canada or overseas according to the shape they are in. Such men may be called up later and re-examined or they may be called or they may be called for non-combatant services. The immeliate need, of course, is for men fit for active service.

Experience shows that the physical condition of men varies greatly; that is, a man may improve greatly in a few weeks or months. Some of those passed as fit by the medical boards recently had been rejected by the doctors when they had applied for enlistment in the volunteer forces.

Settle the Flour Question
BY USING
PURITY FLOUR

Once you know how good Purity Flour really is, you will rely on it constantly for all your baking needs. It goes further, too, and is therefore the cheapest flour you can use.

More Bread and Better Bread---and Better Pastry, too.

DAIRYING.

THE BROOD SOW AND HER LITTER

Those who have been long engaged in the breeding of swine know that the new-born pib is the main stay of hog production. The much needed expansion of the industry depends largely upon the number and quality of the pigs that are raised. Many pigs are lost and many are developed below their capacity because of careless treatment during their first weeks of life.

Happily, the late-summer and fall-farrowing sows are usually in better health and more vigorous than those that gave birth to spring litters, consequently little trouble is to be feared. The run of lush alfalfa, clover and blue grass pastures and the exercise obtained by foraging contribute most liberally to an easy parturition and a robust litter. The greatest danger lies in the possibility that the sow may smash her pigs. This misfortune is not entirely preventable, but the following conditions will reduce it to a minimum:

1—Have the sow in good physical condition at parturation.

2.—Give the sow a small feed of shorts and skim milk slop for two days before parturition.

3—In the farrowing pen, place a 2x4 inches scantling 8 inches from the floor and 6 or 8 inches from the wal lto prevent the sow from lying too close to the wall.

4—Provide the sow with a small amount of clean bedding.

5—Be on hand during the act of "pigging" to lend assistance in case of abnormal presentations.

6—Remove the mucus from each pig's nose as soon as it is born so as to allow breathing.

7—If the sow is feverish, restless, and consequently irritable, place the new-born pigs in a basket warmed by a hot-water bottle until the sows all have finished farrowing when the youngsters can be placed to the teats without having been injured.

8—Remove the after-birt hand soiled bedding from the pen and bury it.

9—Do not disturb the sow by offerinigi ihieiri iiiiiiii lq'l etaon etaoinn ing her feed for twelve hours after farrowing, but provide water to quench her thirst.

When twelve hours have elapsed give the sow a thin slop of shorts and skim milk. A 250 or 300 lb. sow should receive two pounds of shorts mixed with one half gallon of milk for the first meal. Then as each day passes, add two pounds of shorts and two pounds of milk for each pound of shorts until the sow is receiving from ten to twelve pounds of shorts plus the milk in the proper proportion. Then begin to reduce the shorts at the rate of one pound daily replacing it with ground barley or corn mea luntil the ration consists of one half shorts and one half barley or corn plus the milk. Therefore, in fourteen to sixteen days the sow will be on full feed.

As soon as the pigs are able to move about, all should be placed on pasture, for it is indispensable to economical growth. If scours appear among the pigs, reduce the sow's feed, give her a dose of epsom salts and each pig a teaspoonful of castor oil. If lumps develop, the remedy consists in reducing the sow's feed compelling the pigs to take plenty of exercise. The pigs should be induced to eat as quickly as possible. This can be done by feeding the sow in a low flat trough into which the pigs will soon learn to go. This accomplished, provide a separate trough enclosed within a creep, so as to exclude the sow and give the pigs a feed of shorts and ground oats mixed with ski mmilk. Keep all the troughs clean and so prevent the pigs from swallowing filth and germs which cause digestive disorders.

The care during "pig-hood" determines the kind of hog that will be produced in the end. The milk-fat must never be lost, nor the pig's capacity, to consume and assimilate food, weakened. Always use judgment in feeding and tereby prevent the pigs from acquiring the habit of getting "off feed." Plan to feed so as to grow strone bone and muscle and to that end use an abundance of bone and muscle producing feeds. Insist upon plenty of exercise, but provide shade. Remember that a badly raised pig never goes into a pork barrel showing a profit, whereas a well raised pig will amply repay for the time, feed and labor invested.

CALF OF TODAY WILL BE THE COW OF THE FUTURE

The first milk, or colostrum, as it is called, should always be given to the young calf. It has a peculiar laxative effect which is especially desirable. It must be remembered that the little heifer calf will soon grow to take its place in the dairy herd, and its success as a milker will depend a great deal upon its digestive capacity and the functional perfection of its digestive organism. A dairy cow with large barrel and well developed capacity, together with healthy normal physical condition, is invariably a good milk produced. A cow inherits most of her milk-producing qualities from her ancestry. Breeding plays an important part in the development of the herd through the heifers, however, breeding and ancestry alone are not sufficient. The young heifer calf must be fed and handeld in such a way as to bring out the very best qualities that are in her.

The first step in her raising is the clearing out of her digestive tract by means of the colostrum. This can be done either by allowing the calf to remain with the dam for the first day or so, or by drawing the milk and immediately teaching the young calf to drink. Most dairymen prefer to allow the little calf to remain with its dam from 24 to 36 hours, then remove it to separate quarters out of sight and hearing of the mother cow where possible.

The flow of milk from a good dairy cow is considerabl ygreater than the calf can manage. The question naturally arises as to how soon the new milk is fit for use and the market. Ordinarily the seventh milking after calving can be saved. A test that can be applied to make sure of its fitness, is to take a small portion of the fresh milk and heat it to a boil. If it is not yet ready for use it will curdle or thicken and in that event should not be used.

As long as the calf is fed whoel milk it is better to use the milk from its own dam, feeding it as soon as it is milked and before it cools. Cold milk is apt to derange the calf's digestion. While the milk should not be frothy it is better to feed while it contains the original animal heat rather than artificial warming.

Sudden changes and irregularity in feeding will surely cause digestive troubels. Dirty feeding pails and insanitary surroundings are sure to cause scours. Wooden troughs for feeding milk should be avoided entirely as they absorb flies and collect dirt and germs. The feeding pail should be thoroughl ycleansed with scalding water and allowed to dry in the sunshine. Musty or dirty hay should not be fed but the calf should be given a fresh supply of alfalfa or clover hay each day as soon as it begins to eat. A handful of bran or ground oats should be placed in a clean box manger, after it is a week or so old and it will soon begin to nibble at it. Such

feed is better if placed in the box dry and after a taste is once acquired for it, then allow no more at a time than will be cleaned up each day.

Skim milk fresh from the separator can be introduced into the feed after the calf is two weeks old, but the substitution must be gradual and the temperature kept the same. A sudden change may cause scours. Skim milk for the growing calf will produce equally as good results as whole milk. The fat taken out by the separator can be supplied by grains while the protein so necessary to its rapid and healthy growth still remains. If desired, a little flaxseed meal or corn mea lcan be added to the ration to supply the fats removed by the separator.

To develop the heifer into a good dairy cow and bring out the very best producing qualities she has in her, it is necessary to give her the very best of care and considerable treatment and feeding. The different organs of her body must be kept in perfect condition and her digestive capacity encouraged. Plenty of fresh water should at all times be within her reach. The dairy cow of the most pronounced type is built mainly around two points, the digestive and the milk glands or udder. The one digests and assimilates the food while the other converts it into milk. The dairyman should work toward the development of these two points from the very beginning. Careful feeding will improve the one, while gentle massage before the first calving period may help the other, besides getting the heifer accustomed to being handled so that milking will cause the least excitement possible. She should at all times be given gentle and considerate treatment. At no time should the dairyman lose sight of the fact that the little calf of today may soon be the best cow in his herd and that looking toward this end the calf should be handled just as carefully as the finest cow in the herd. P. H. E.

COST OF DAIRY HEIFER

What does it cost to raise a dairy heifer to one year and to two years old? This question is answered in the September Monthly Bulletin of the Ohio Agricultural Experiment Station, in which the claim is made that dairymen usually underestimate th evalue of heifers.

Feed alone at medium prices costs about $33 for the first year and $28 for the second. Cost accounts of raising calves by the Ohio, Massachusetts and Connecticut Experiment Stations and the United States Department of Agriculture were used as the basis for these figures.

Labor, interest and miscellaneous overhead expenses must be added to this feed cost. The two-year-old heifer must be credited with a calf and the manure produced during two years. The net cost at medium prices is then given in the bulletin at $44.77 for the first year and $29.08 for the second. At present high prices, the net cost for two years rises above $100.

Economy in dairying and care in breeding only good stock are, therefore, necessary. The heifer from a low-producing dam and an inferior sire will not return the cost of her production and maintenance.

BALANCED RATIONS SAVE DAIRY FEEDS

Dairymen can solve the feed shortage by the same method that people are using to solve the food shortage. They can make what they have, go further. If food economies can result in feeding more people with the same amount of food, the same feed can feed more cows.

No one advocates the killing of part of the people in order to provide an abundance of food for the rest. It is not more necessary to kill large numbers of dairy cows because of a short feed supply. Such action, moreover, taken in the face of our national need for dairy products, would be calamitous.

Dairymen who feel the pinch of feed shortage will do well to give special attention to balancing their herd rations. A balanced ration is an efficient ration. It means making the most of the feeds used.

Unless a proper balance between the protein and fat and carbohydrates contents of the ration is maintained, waste is certain. This waste may be either in feed, in productoin, or both.

When the production of a cow is limited by the amount of protein in her ration, the addition of more carbohydrates and fat does not help the situation. More fat and carbohydrates in that case only increases the amount of fat the cow is able to put upon her back.

This extra fat constitutes still another waste of feed. The dairy cow does better work when not in a beef-fat condition. Not only does extra fat on her back mean lost energy in putting it there, but additional lost energy in vitalizing and maintaining it.

Though seldom the case, carbohydrates and fat may be the limiting element in the ration while there is an excess of protein. This is more serious than an excess of carbohydrates and fat, for protein is more difficult and costly to obtain.

The fine point in feeding dairy cows is to use such feeds in such amounts as will give the greatest production at the most profit. This calls for balanced rations. With feed prices at their present altitudes, it will pay dairymen to make a special study of their feeding practices.

VARIATION IN COLOR OF BUTTER

Why is butter yeliow? Why does it vary?

Chemists investigated the cause of this variation in color as long ago as 1830, but it remained for the dairy department of the University of Missouri College of Agriculture to determine the real source and nature of the natural color of dairy products. Three years of investigation not only showed the cause of the natural color, but made clear the nature and source of the yellow color that is found in the body fat of cattle. The coolr in the tallow is exactly the same as that found in butter. Cows that give yellow butter have yellow body fat, while those which give a whiter butter have whiter body fat. The coloring matter in both cases is carotin, so-called, since it was first found in carrots. The yellow coolr in milk and butter is not made by the animal, but comes from the feed. This coloring substance is found in all green leaves, which accounts for the yellow butter i nsummer. By continued feeding of feeds free from coloring matter, it was possible, in the experiments conducted by the college, to obtain white butter from a Jersey cow.

"PEDLAR" "Means Permanence"

NOW'S the time, when the harvest is all gathered in and fall work about completed, that the wise farmer considers what improvements are needed in his buildings.

BEGIN with the idea that any improvement you make will have the character of permanence — proof against fire, lightning, storm and every form of decay.

PEDLAR'S "PERFECT" SHEET-METAL PRODUCTS

FOR THE BARN

Use Pedlar's Galvanized, corrugated Steel Siding and Pedlar's "George" Shingles. No waste whatever—you can figure down to the last foot. And you'll have a barn that will last a lifetime without repair.

FOR YOUR HOME

You'll never need to spend much money on repairs if you cover the exterior walls of your house with Pedlar's Stone or Plain Pattern Siding. It is handsome, durable, fire and weather-proof.

SAVE YOUR IMPLEMENTS

By housing them in a Pedlar Steel Building. Implements cost money—a Pedlar Steel Building will keep them in good condition and always easily accessible. Build now, before the snow comes.

FOR THE SILO

Use Pedlar's Silo Covers. Proof against fire, lightning and storm. Will never rust. Have a perfect automatic ventilator, a wired glass window, and a specially designed blower hole that means the utmost convenience in filling.

FOR INTERIOR FINISH

There is nothing equal in beauty and durability to Pedlar's "Perfect" Metal Ceilings and Walls. 2000 handsome patterns. Easy to put on, will never need repair and will outlast the house itself.

FOR YOUR CAR

Keep your automobile in a Pedlar's "Perfect" Metal Garage, either metal-clad or all-metal. Comes in interlocking sections, ready to erect. You can build it yourself in a very few hours.

GET THE FACTS

Let us send you full particulars concerning Pedlar's "Perfect" Sheet Metal Products.

Everjet Elastic Paint

An Ideal Farm Paint

Around the farm or home, wherever you have surfaces exposed to wind, wear and weather, you can save money and the trouble of renewing things, by using Everjet Elastic Paint.

Carbon paints are the most durable of all and Everjet is the best carbon paint ever made. It is the ideal roof paint. Stops deterioration and leaks; adds a good many years to the life of a roof.

Wonderful on metal surfaces because it is elastic and will not peel or crack under temperature changes. It will keep your implements fit. Try some. You will never be without it.

SHEEP RAISING IN CANADA

H. P. Timmerman, Industrial Commissioner, C. P. R. analyses the Situation

The Sheep population of the World numbers well over Six Hundred Million, and out of twenty-five countries Canada is near the foot, being twenty-second with 2,175,302, Australia coming first with 85,057,402. The decrease in Canada in the number of sheep between the years 1901-1914, the most recent figures obtainable, amounted to 334,937. Between 1900 and 1910 the number of sheep in the United States decreased 8,896,266, being given as 52,838,748 in the latter year.

The number of sheep per 1,000 inhabitants in 1914 in Australia was 10,970; Ireland 823; Great Britain 578; United States 575; Canada 302.

The number of sheep per 1,000 acres of productive land in 1914 in Australia was 709; Great Britain 509; Ireland 192; United States 60; Canada 20.

These figures show to what extent the number of sheep in Canada might reasonably be increased, but instead we seem to be killing off the lambs and sheep very rapidly. The number slaughtered under the Meat and Canned Foods Act 1907 amounts to nearly 25% of the whole, not taking into account the farmers killing.

Canada's free imports of wool amounts to over six million dollars per annum, and of Wool Manufacture nearly Twenty-five Million Dollars per annum.

Since the beginning of the war, raw wool has increased over 100% in value, being now worth about 60 cents per pound, but this increase in value is partly due to better grading and co-operative marketing, as well as the introduction of pure bred animals. The fault having previously been the want of preparation of the wool bringing it into ill-repute for manufacturing purposes and cross breeding which produced a medium and coarse wool not so valuable as the pure bred. The production of the latter, while improving the wool, is said to lower the standard of mutton characteristics, but the introduction of pure bred animals for the finer grades of wool is not likely to be so extensive as to affect the meat production, and larger profits are to be obtained from wool rather than from mutton.

Of Canada's wool production which amounts to about fifteen million pounds per annum, the graded wool offered for co-operative sale in 1916 amounted only to 1,721,598 pounds, a great deal still being marketed in an unfinished condition, wool being simply wool to the ordinary farmer, and the educational work now under way should be supplemented by every reasonable means.

An incident showing what the Railway may do and the good effect produced, was the arrangement made by this Department for free short courses to be given by the MacDonald College staff between Megantic and Waltham in 1914, in which the sheep industry was made to feature very prominently. As a result of this trip Pure Bred Sheep Associations were established at nine points, with a membership of about 1200 and the wool clip of last year was increased over 20,000 fleeces from the product of pure bred sires immediately afterward distributed from the College Farm. It is desired now to extend these operations, and I have in hand with the College and Provincial Authorities the running of Sheep Sales Cars over the same route then followed, these to be advertised as stopping a certain day at each point in order that pure bred animals picked up may be disposed enruote.

The difficulty now is found to be that the farmers' are unable without considerable expense to obtain better stock, this, in most cases, preventing them from going into the business.

Ontario seems to be better provided in this respect, but we may find it profitable to extend operations to New Brunswick and along the ilne of the D. A. R. in Nova Scotia, after we see the further result of it in Quebec.

Another matter bearing upon the raising of sheep is that of the dog nuisance. While in Eastern Canada the wild animals are not so destructive as in the West, there are more dogs, and heavy losses have occurred.

Quebec has recently adopted an admirable law, which places the responsibility upon the Municipality to the extent of two-thirds of the value of the destruction by Dogs, and this is having a pretty good effect upon the owners of these animals. The Act recently passed by the New Brunswick Legislature makes this branch of animal industry much more secure than in the past from the dog nuisance.

To show how sheep raising is being taken up in the Western Provinces—During the week of June over 25,000 sheep were sheared at the Lethbridge Exhibition grounds. The work was done by machinery, one man being able to handle on the average 200 sheep per day, the cost being 13 cents per capits. The wool, which was of the highest quality, averaged 8 pounds per fleece and several owners disposed of their clip at 56c per pound, an average of $4.48 per fleece. The increase in the number of sheep in Lethbridge district this year is estimated at 80%. Up to July 19th, 24 carloads of wool had been shipped fro mthe district this year and there were six more to leave immediately; Lethbridge wool shipments are estimated to total 1,200,000 pounds, which, at any average price of 55c per pound approximates $650,000.

REGULATIONS RE SHEEP

I beg to inform you that the United States Bureau of Animal Industry has issued the following new regulation governing the importation of sheep from Canada:—

"All sheep imported into the United States from Canada for breeding, grazing or feeding must be inspected at the port of entry by an inspector of the Bureau of Animal Industry. They must also have been inspected by a veterinarian in the employ of and receiving a salary from the Canadian Government, and be accompanied by a certificate signed by him stating that he has inspected the sheep and found them free from disease, and that no contagious disease affecting sheep has existed in the district in which the animals have been kept for 60 days preceding the date of importation. The owner or importer shall present an affidavit that said certificate refers to the sheep in question. Any such sheep which are unaccompanied by the aforesaid certificate shall be subjected to a quarantine of 15 days."

It will be seen that the necessity for dipping Canadian sheep for export no longer exists. They will be admitted to the United States when accompanied by the proper health certificate, and sheep men throughout Canada, who have been engaged in the export trade, will welcome this change as removing an impediment to their business. It is also a tribute to the healthfulness of Canadian sheep and their freedom from Sheep Scab.

METHOD IN BRITAIN OF IDENTIFYING BEST ANIMALS IN THE FLOCK OR HERD

Breeders of pure bred sheep in Britain are very particular about the identification of the offspring of their registered stock. They consider this of the utmost importance, both for the breeding of their home stock, as well as keeping up the demand that there is for the stock in Australia, New Zealand, South Africa and the Argentine. In the breeding of their home stock they could not, without marking the lambs, intelligently breed along the rules that guide them in line breeding, and in regard to the overseas demand, indiscriminate breeding would also result disastrously to that enterprise. Without identification marks many good animals would be lost to the breeds, and correct registration becomes impossible.

Selection and culling is the chief medium whereby a farm flock or a breed is improved or kept up to the standard of the brede. Sheep are the one calss of animal that are difficult to spot or identify without distinctive marking.

Deterioration becomes rapid if the selection is left to guess work, either with the males or females of the flock. Without a definite plan, identification becomes troublesome and is thus not seriously undertaken by the average breeder. The young things grow up beyond recognition, often entailing financial olss to the careless breeder and greater loss to whole flocks and herds of the pure bred interests. Breed Associations in Britain safeguard their own interest by enforcing the rule of marking and correct registration.

The use of ear tags or buttons have been discontinued. The ear of

the sheep is the only place where marking becomes lasting and practical. In show sheep this part of the anatomy gives evidence of breed quality, and to make identification easy the ear tag has to be put on when the animal is young. The growing cartilage is therefore spoiled; the ear gets dwarfed and twisted, and points are taken off in the value as a prize getter, or even in the sale ring where breed points count. Also the tags often get torn out, particularly if there is wire fences around. This makes a painful slit in the ear, which is at once a disfiguration and a loss to the breeder when he is selecting his animal for show or sale. Tags have now been discarded as non-efficient, troublesome and expensive.

The system adopted now is that of small notches, and reference to the accompanying will simplify explanations or directions. Notches in the left ear stand for units, while those on the right ear stands for 10's, and the holes in the ear for 100's. By a process of addition any number can be arrived at, up to hundreds which will generally meet with the desire of breeders in selecting special animals for show, sale or breeding.

A notch on top of the left ear near the head is No. 1, and the notch in the middle of the top of the left ear is No. 2, the notch on the top of the left ear is No. 3. The notch under the left ear near the middle is No. 4, and near the head is No. 5. By using two notches individual numbers up to nine are secured, thus, 5 and 1 are u, 5 and 2 are 7, 5 and 3 are 8, and 5 and 4 are nine.

The 10's in the right ear come just as the units in the left. By a combination on both ears it is easy to count up to 100. For instance a notch on the top of the left ear and the same on the right ear near the middle make 22.

A hole in the left ear is 100, a hole in the right ear is 200, and in both ears is 300. These markings can be made the day the animal is born and gives a sure method of identification until the day of its death. It can be used on any animal irrespective of its color.

All the implement that is necessary for the work is an inexpensive punch. There are some who become expert in the work and can mark them with a pen knife, but the punch gives notches of uniform size, and makes the operation simple and of easy accomplishment at the first trial.

To further facilitate the work of identification and registration a private record book is kept, from which is filled out applications for registration. For instance an entry in the private book may show that Shropshire Ram No. 9, born April 14th, 1916; sire 18366, dam, 24017. When the registration slip is returned it bears the private No. 9, and the registration number given to the animal.

Even the breeders of sheep that do not wish to go tre extreme limit of registration, will find it profitable to ear mark and take private note of the lambs as they arrive. No breeder of sheep can intelligently conduct sheep breeding operations that does not take this precaution. By it, a breeder can classify his own strains and breed accordingly. It is the only way that a particular type ca nbe set up, and any sheep breeder knows that there are strains superior to others in the same breed and these should be all marked at infancy, so that they do not become lost, or that the qualities of the strain be upset and virtually lost by outcrossing with an inferior strain in his own flock, or that of the flock fro mwhich he procures a change of tup or ewe.

PROPER AGE FOR CALVING

The most desirable age at which to have heifers calve is a very important question. So says Prof. G. C. White of the Connecticut Agricultural College. In a great many herds, it is certain that the method of raising heifers is not such as to permit full development of their inherited powers o fproduction. It has been shown that the larger cows of any breed are capable of higher and more profitable production than those of small to medium size. The extra capacity is a favorable point, providing they are equal in other respects.

For the most part, the belief is very common that it is necessary to have cows calve early in order to stamp upon them dairy qualities rather than tendencies for beef production. Some practical men discovered in their own experience that this was not true, and recent experiments also bear upon it. The belief that roughage should be fed to develop digestive capacity is also common, but it has been found that heifers raised with much in the way of concentrates, and with small amounts of roughage, were as capable of consuming dairy rations as heifers raised almost exclusively on roughages.

Aside from the question of cost, the age is of little consequence. The aim should be to develop big, strong cows —and the procedure may depend upon conditions. If concentrates are used liberally, the rapid development will permit of earlier breeding. If the use of concentrates is limited, the first calving period shoul dbe postponed.

In general practice, the cows must pay the bills, and this is of primary consideration. Roughages, so far as possible, must therefore be made use of, and heifers must calve before the returns will commence to come in. Records of production from the Connecticut Agricultural College herd of Holsteins show the value of heifers well developed at calving time.

The age of first calving varies from one year and eleven months to three years and six months. The heifers when not on grass, are fed three to six pounds of grain daily, with hay and silage, and are kept in thrifty, growing condition. They are divided into two groups, those calving at 30 months or less and those calving at later than 30 months. The average age of the early calves is two years and one and two-fifths months, and of the late calves, three years and one month.

The average production of the early calvers' first period was 7,691 pounds of milk and 273 pounds of fat in an average of 356 days. The late calvers produced 13,128 pounds of milk and 443 pounds of fat in 365 days. The second milking period, the early calvers produced 9,684 pounds of milk and 342 pounds of fat in 365 days; the late calvers produced 14,682 pounds of milk and 473 pounds of nfat in 365 days. In the third period, the early calvers produced 13,552 pounds of milk and 467 pounds of fat in 360 days; the late calvers (only one complete) produced 14,236 pounds of milk and 520 pounds of fat in 365 days.

In the early group, none have produced over 18,250 pounds of milk. In the late group, three have exceeded this, one with her first calf. Two of these heifers have made over 20,000 pounds of milk, one with the second calf. At least two other late calvers have the capacity to produce over 20,000 pounds. It is not probable that any of the early calvers will do this unless one now milking in her first period, having calved at 30 months of age, may some time accomplish it. She will be given a long dry period, to permit of full development.

For various reasons it is becoming more and more important for dairymen to get the most efficient production from their herds. In herds of doubtful dairy qualities, there is good reason to have cows calve early, to find as soon as possible if they are worth keeping. In a herd of dairy quality of medium to high order, more attention should be given to full development of the heifers in size and capacity for efficient and profitable production. Holsteins should calve not earlier than 30 to 32 months of age.

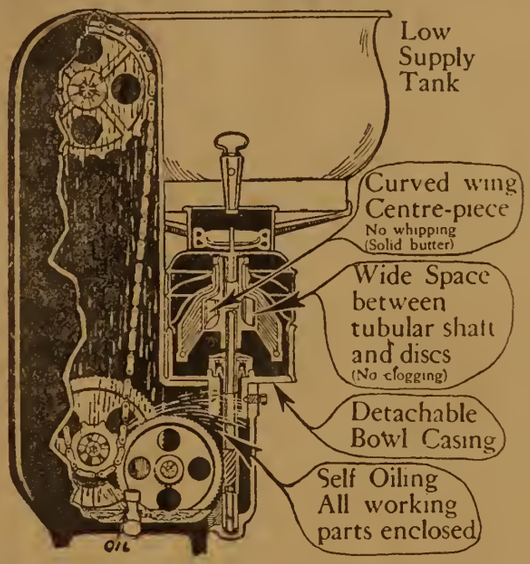
More Cream and Better Quality

The Standard not only skims closer than other machines but it gets the richest, highest quality cream. Ordinary machines will not do both. "During the past two years," writes one of the principal Creameries of Canada, "the **quality of our products has risen** in a surprising way, and we can obtain a **higher price for our butter.** The reason for this is undoubtedly due to the **increase in the number of**

Standard

Cream Separators in use among the dairymen supplying us with cream.

On page eleven of our latest catalogue you will find positive proofs, repeated over and over again, that the Standard skims down to one-tenth pound of butter-fat per 1000 pounds of milk skimmed.



Low Supply Tank
Curved wing Centre-piece
No whipping (Solid butter)
Wide Space between tubular shaft and discs
(No clogging)
Detachable Bowl Casing
Self Oiling All working parts enclosed

There are no milk or cream tubes to clog. The simple Standard bowl can be taken apart and quickly cleaned. The discs do not clog because there is an extra wide space between the tubular shaft and the discs. The self-oiling system adds to the perfect cleanliness and to the sanitary features of the Standard.

Finally the curved wing bowl centre, an exclusive Standard feature, distributes the milk to the discs evenly and without whipping; the globules of butter-fat remain intact and the result is firmer, superior butter—more profits.

All these splendid advantages, besides many other exclusive features, are fully described in our literature. Write for it today.

THE HORSE

YOUNG COLTS THAT SURVIVE SHORT TIME AFTER BIRTH

The past foaling season was a disastrous one to many owners of mares in a wide-spread territory and they are looking for the causes of their losses. These are not far to seek in many instances, but in others are difficult to find and we fear that some of the owners are placing the blame where it does not actually belong. The subject therefore is well worthy of consideration here and we hope to be able to throw light upon it which will help to prevent similar losses another season.

In perhaps a majority of cases the foals have come into the world weak and unable to stand up and suck. Such foals usually have large, fat flabby navel cords. On the contrary the foal that is quickly on its feet and nursing has a small, or "shoe-string," navel and such a cord is not so liable to infection. The large cord quickly becomes infected, or the foal having such a cord is weak in constitution, lacks resistant power and so more readily contracts infection of the navel and joints and succumbs to this disease which is termed pyemic arthritis.

In your experience it is quite usual to find that the foal with the small cord was sired by a grade or scrub stallion that had worked every day, or been so thoroughly exercised every day that he was at all times in muscular condition and able to do the kind and amount of work which would be expected of his progeny when developed. Foals with thick, flabby cords commonly are fat and flabby and correspondingly weak in constitution and such foals often are the offspring of stallions that have been pampered and overserved, or of mares that have been overfed, underworked or exercised and kept too much confined to the stable. Then there is the foal of the mare that has been overworked, underfed and kept in unsanitary surroundings. That foal lacks vitality at birth and, like the fat, flabby foal, may easily contract navel and joint disease, or simply succumb from want of strength and ability to stand up and suck.

Let every horseman do all in his power to have the colt born into the world with a "shoe string" navel.

To that end we would suggest the necessity of working or exercising the sire so thoroughl ybefore and during the mating season that he will be in muscular condition, fit to work hard and having every organ in perfect health. To have the stallion in such shape it should be evident that he must not be maintained in "show condition." Unfortunately if one "renders out" the blubber and fat of show condition there may not be much left of the prize winning stallion and the buyer, who has paid a big price for the horse, is afraid to put him into work condition for fear he will look so ordinary that the owners of mares will not give him profitable patronage. The most desirable and profitable sire is the one that is a grand, good horse when in work condition. Any stallion that is not of such good individual type and character as we have suggested here is a poor apology for his breed and pedigree and this alone should bar him from patronage.

Strong Mares Essential

Many a pampered purebred is a menace and detriment to the neighborhood in which he is used, and it is because such purebreds are too commonly and notoriously inefficient as the sires of stand-up-and-suck foals that grade and scrub sires persist and obtain patronage. It is equally detrimental to pamper the mare. She should be kept in good muscular condition and healthy, by ample work or exercise, every day throughout pregnancy and should be adequately fed upon sound, wholesome, plain feed. Mated with a stallion similarly managed and fed and the foal from such a mare can scarcely fail to come into the world strong, able to stand up and suck and able also to ward off infection of the navel and joints.

The sire often is blamed for the weak foals when not really to blame. This fact cannot be lost sight of and should be carefully considered. The stallion has done all that can reasonably be expected of him when he gets the mare in foal. The stallion owner owes it to the patron of his horse that the stallion shall be in fit condition for procreation, sound, healthy, adequately fed and not overserved. It will be unfair and dishonest for the breeder to have his horse in any other condition than this; but no blame should attach to him, if his stallion is in the right conditoin as we have outlined and the foals he begets come into the world weak and puny, or quickly die of navel and joint disease or some other disease common to the new born foal.

The mare is responsible for the development and care of the foal, begotten by the stallion that is in fit condition, and this the mare owner should understand and abide by in practice. Yet he too often blames the sire when he has ill-fed, over-worked, abused or injured his mare by ignorant or careless management. The fact that the sire is strong an dprepotent will not protect the foal and bring it into the world strong and able to stand up and suck if the pregnant mare is fed on weathered straw, hay, or other unsuitable or unsound feed, made to haul logs or other heavy loads on a bare road, or made to haul manure over soft land, or do other work too hard and too straining for a pregnant mare to safely accomplish. Then too the mare owner should be careful to have the foal born in a clean place.

ANSON SECOR.

REMEMBER THE HORSE ON HOT DAYS

If the following precautions are carefully observed, there will be little danger of over-heating horses during hot weather.

Give a pailful of water to each horse in the middle of the forenoon, and the same at four o'clock in the afternoon on a hot day. Be careful with the horse that is a little out of health if you are working him on a hot day.

Look out for a horse that, after sweating, suddenly stops sweating. Put such a horse in the shade as soon as possible and give a moderate drink.

Do not put a horse not in good condition for hard work in the center of a three or four horse team in hot weather.

Work carefully on a hot day when the atmosphere is moist and heavy.

A horse can hardly get too hot to water, but one must regulate the amount by the temperature of the water.

In case of an attack of over-heating, the horse should be taken to the shade as soon as possible. A treatment of the surface of the body, particularly of the head, with cold water should be given until the temperature is within a degree or two of normal.

Stimulants, such as whiskey or brandy, well diluted, should be given as early as possible. In most cases it is better to plan to avoid overheating than to plan to treat the horse for it.

When horses are sweating freely there is no danger in giving water and no great danger of becoming overheated. However, if horses are panting, in which case sweating may suddenly cease, there is great danger.

CORNS

There is no ailment so common to horses feet as corns, and no ailment in which so little is done to prevent or alleviate the horses suffering. Fully nine teenths are from this source. They are the result of uneven pressure of the shoe, too much bearing on the quarters, especially the inner one and too heavy bearing on the heels. This results from shoes being left on too long without being reset. It is necessary, as a rule, to shoe horses' feet, and in order to keep them healthy the shoes should be reset about once a month, the sole and wall reduced to their proper size, heels opened, and the ragged surface, if any, trimmed off the frog. When the hoof is bruised by careless shoeing or other similar cause, a pink spot will appear at the place varying in size from a 10 cent piece to a quarter of a dollar. If the bruising is light, the corn may become hard and remain a constant source of lameness. This is probably the type of the corn your mare has got. In severe cases where the corn cannot get free through the

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY

For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N, S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro. N. S.

Advertise in the FARMER

hardness of the wall of the hoof, a grittor may be formed. By applying the hand to the foot you may notice extra heat in the sore part and by tapping the hoof, gently with a hammer she will flinch when the sore part is tapped.

After the shoe is removed, if you find any indication by pink spot or heat, that it is a corn that is producing the lameness, pare out the quarter well, and put the foot in a linseed poultice made up soft with hot water. Leave it on twenty-four hours, then renew it. Cut the hoof well away where the corn appears and after the matter escapes ,pour in some hot tar. Extra care will have to be taken of the feet that have once been affected with corns, to keep them soft. Many substances used for this purpose are injurious to the hoofs by making them brittle. Bathing the hoof occasionally in warm water is about as good as any method.

A horse that has chronic corns can be cured by shoeing him with shoes that let the heels come to the ground and take the wear. This will allow the quarters to spread out, which in time will grow the corns completely out.

Horses are like humans in regard to their tendency in having corns, but they are often inhumanly treated in the matter of shoeing. A little consideration and comparison between well fitting and ill fitting pinching shoes on feet affected with corns, should be given to the horse that is pained and lame while doing his daily round on the farm.

SORE SHOULDERS WILL REDUCE LABOR

Many sore shoulders may be prevented by taking enough time to see that the collar and hames are properly fitted or adjusted. Daily attention to the bearing surface of the collar and its pad at the top will also prevent many sore shoulders and necks. The collar must be kept scrupulously clean. This can be easily and quickly done by wiping or sponging the surface of the collar as soon as it is removed. This will remove all sweat and other accumulations that act as an irritant an dproduce sore shoulders.

Many other sores can be prevented if the horses' shoulders are kept clean. The curry comb and brush used every morning are great aids in this direction. Much good will also result if the horses' shoulders are sponged with cold water every evening when the collar is removed. The application of the cold water reduces inflammation and cleanses the skin thoroughly. In addition, this treatment will also have a tendency to harden the skin and make chafing less likely to occur later in the season when warmer weather and flies arrive.

If a horse already has sore shoulders it is the owner's duty to make a serious attempt to heal them. The sore should be cleansed daily with a solution of sheep dip, two tablespoonfuls per quart of water. After this has been applied, the sores may be covered with a thin layer of ordinary white lead ground in oil the same kind that is used for mixing paint. One pound of the lead will be sufficient to alst during the entire summer and will cost but a few cents. Its use is usually attended with very satisfactory results, providing it is faithfully and regularly applied.—C. C. Lipp, V.S

I had a horse that was nervous and high strung and would not stand to be hitched up. I made a practice of tying the horse to a post while being hitched and leaving her there for a few minutes. Two or three months' work of this kind cured her. I kept her tied and never allowed her to start as soon as I had finished hitching—W. J. Blackham.

I read your S O S call as to how to hitch up a very nervous horse that insists on starting before you are ready.

I had trouble of this kind, and finally found that it was due to a too-tight bridle. The horse may also be checked too high, the bit may be too harsh, some other part of the harness may be too tight. These things make a horse nervous. My horse was, I think, as nervous as any horse could be, but by handling him kindly and talkink to him gently, so that he knew he would not be harmed, he was quieted down and will stand without any trouble until I am ready to go—A. C. B.

Kindness is the best remedy I know of for a nervous horse. Always speak gently to her both in the harness and in the stall. An occasional piece of apple or lump of sugar fed from the hand will go a long way toward winning the animal's confidence, unless she already has been badly spoiled. A nervous animal that won't stand while hitching should be worked every day, and is best handled by the same person if possible. Quieting them down is a gradual process, and one of kind treatment.—B. F. Taylor, Farm & Home.

One day two laborers were discussing the wiseness of the present generation. Said one:

"We be wiser than our fathers was, and they was wiser than their fathers was."

The second one, after pondering a while and gazing at his companion, replied:

"Well, Garge, what a fule thy grandfather must a' been."—

Child Was Nervous, Irritable, Tired Out

She Had No Appetite, and Her Complection Was Pale and Sallow.

How many parents realize the strain which going to school means to the child who is naturally nervous and of delicate health?

You see them come from the schools daily with pale faces, many wearing glasses, and looking tired and worn. At home they are irritable, do not sleep well at nights, and are upset by a little extra excitement.

If they are to grow to healthy manhood and womanhood their systems must have attention now. Such treatment as Dr. Chase's Nerve Food does wonders for children in this condition. We are constantly receiving letters from grateful parents telling what the Nerve Food has done for their children. This one is a fair sample:

Mrs. Stephen Hartman, Italy Cross, Lunenburg Co., N.S., writes: "My little sister at eleven years of age became nervous, irritable and seemed all tired out. She had no appetite, was lifeless and drowsy and her complexion grew pale and sallow. Finally she had to keep her bed and have somebody with her all the time. She was afraid of everything, would get excited and tremble till the bed would shake. As she seemed to be getting worse under the doctor's treatment, mother decided to try Dr. Chase's Nerve Food. After she had used about four boxes, improvement was noticeable and it was wonderful to see how much brighter and stronger she grew week by week. She used ten boxes altogether and they cured her. She got fat and rosy and went to school every day with an ambition that she never seemed to have before. I do not hesitate to recommend Dr. Chase's Nerve Food to anyone, for it was indeed wonderful what it did for her."

Dr. Chase's Nerve Food, 50c a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Ltd., Toronto.

POULTRY.

SOME POULTRY PARASITES THAT RETARD PROFITS

Many poor egg records and many unthrifty flocks result from the presence of lice and mites on the fowls. Scarcely any flock is ever wholly free from vermin. In small numbers they do little damage except to cause annoyance to the fowls, but they are rapid multipliers, especially in warm weather and unless periodically checked they become so numerous that positive loss results.

A man may start in the poultry business with everything new and clean, but in some way or other vermin soon manage to put in an appearance. Sometimes one cannot find any lice on his fowls, or at least not enough to make the matter seem important. It is well to remember, however, that every adult fowl is more or less lousy, and should be treated with suspicion, and examined occasionally, as vermin often appears unexpectedly. In small numbers they present no particular problems, but in hordes the process of extermination must be quick and drastic.

There are many different types of vermin that prey on domestic fowls, but for all practical purposes they may be divided into two main classes. The first is the body louse, which stays on the fowl's body nearly all the time, and may be detected traveling around over the skin, especially on the neck, under the wings or among the fluffy feathers under the vent. The second class consists of the red mites or lice which infest poultry houses and their fixtures, hiding in cracks and crannies during the day and coming forth at night to seek their prey.

The latter are the most annoying. None of the mite varieties breed on the bodies of fowls, but throughout the house and fixtures, so that applications to the fowl's body have no effect upon their destruction. They ravage their victims at night like the bedbug. In dirty nests, cracks of the walls, underneath perches, etc., they multiply so fast that sometimes all of the pests can not find a hiding place and cover the surfaces.

All fowls and birds are bothered with mites of a size in proportion to the size of the bird; quail have them about half the size of chickens, while smaller birds have them so fine they look like dust. All are blood-suckers, thus lowering the vitality of the fowls and often bringing disaster.

Mites are white or grayish in color, except when filled with blood, when they are reddish. While the mites themselves can usually be detected if one watches closely enough for them, a plain indication of their presence is their excrement—little grayish patches like fly specks, on the roosts and adjacent parts whic hthey traverse.

These mites are such rapid breeders that it is hard to totally exterminate them, but their numbers can be kept rather easily within the bounds of safety. Disinfecting, whitewashing, scrubbing and cleaning the nests, roots and all parts of the house help keep them down, if performed thoroughly and at frequent intervals.

Common kerosene oil is fatal to mites and should be liberally painted or sprayed everywhere vermin could possibly find lodgment. This is the commonest and cheapest method, though the liquid lice-killing preparations now on the market offer the surest method of extermination, for they give off fumes that penetrate everywhere and which are as fatal as liquid itself. All liquids may be applied with a small spray pump, brush or broom, as is most convenient. As regards the lice that infest the bodies and feathers of fowls, there are more than a score of different species of them. While these varieties differ in size and shape, their manner of reproduction and the measures necessary for extermination are practically the same in all cases.

One of the simplest ways of keeping down body lice is by means of the dust bath. If the fowls are provided with a few dusty spots where they can wallow and fluff themselves, they will smother many vermin as well as exercise their bodies. Some people sprinkle a little disinfectant or louse powder into the dust bath to help kill the lice. If great droves of them are present, however, a quicker and more effective way of fighting them is necessary. The fumes from some of the best commercial liquid lice-killers, when applied to roosts and nests, will penetrate the fowl's feathers and kill the body lice. Aside fro mthis, louse powder may well be applied among the fowl's feathers, making sure that the kind used is a reputable brand, and fresh.

In dusting a fowl, hold it by the legs with head downward in an empty barrel or box to catch the surplus powder. Sift the powder in among the feathers, then thoroughly work it in with the fingers to get at the base of the feathers, where most of the pests hide. Special attention should be given to the fluffy feathers on the rear parts, under the vent, under the wings and thighs, and about the head and neck. Little chicks, bothered with head lice, should be greased about the head and throat with lard or sweet oil.

THE RATION FOR THE MOULTING HEN

Successful poultrymen are busily employed just now in starting their hens to moult, and with just a bit of judicious handling this can be easily accomplished. Everyone will agree that the early-hatched pullet and the year-old hen, (if the latter are moulted early) will furnish next winter's eggs.

It is not generally known that hens can be made to shed their feathers early and grow the new plumage weeks before it would ordinarily be accomplished otherwise. But actual experience will convince one of the truth of this. By beginning the moulting in July or early August, it gives the fowls ample time to pass through the moulting periol early and uniformly. To feed hens for early moulting the method consists in withholding part of the feed for about two weeks which stops the egg production and reduces the weight of the fowls, then feeding heavily on a ration suitable for the formation of the feathers and the general upbuilding of the system.

A nitrogenous ration with an abundance of animal feed will be found highly beneficial. Linseed meal and sunflower seed both aid very materially in the production of a new coat of feathers. Pure water and sanitary quarters are necessary at all times, but are most imperative during the moulting period. Nature demands a season of rest for all creatures, and when fowls shed their feathers and put on the new plumage, is rightfully their vacation time. Eggs and new feathers do not grow at the same time.

To assist nature a bit is a paying venture. Hens run low in vitality after the strenuous laying spring and summer, and to bring about the earlier moulting puts them in prime condition weeks before the cold weather. Oftentimes hens keep right on laying until late in the fall, and when the cool nights in autumn come, they shiver with cold. The loss from this source can beduced to a minimum by forestalling with early moulting. Feed less meat and bone scraps and more grain and dry mash, and to the latter add some good reliable poultry tonic.

Now when feed experts predict a shortage of foodstuffs, and everyone is urged to do their "bit" in order to avoid famine, every new method that has proved practical should be given a tryout. To produce winter eggs, of which there is usually a shortage, early moulting is imperative.

NEW POULTRY DISEASE

At present when growing chicks are attaining an age of from ten weeks to three months, a disease affecting the liver and bowels is causing considerable losses. This disorder, according to Dr. Wickware of the Experimental Farm, is quite prevalent throughout Canada and is probably responsible for many deaths at present attributed to white diarrhoea. The disease is caused by a small egg-shaped germ which produces inflammation of the bowels and liver. The liver may show changes varying from a fairly normal appearance to large areas of a yellow color when cut into show a cheese-like centre.

The chicks affected appear dull and isolate themselves, usually remaining in the hover or under the hen. The feathers become ruffled, wings droop, appetite is lost and occasionally the chicks will give utterance to a shrill cry, particularly when trying to pass material from the bowels. A white discharge is usually present although it may be rather reddish in color and vent may become pasted with the material discharged. These are the prominent symptoms in typical cases, but chicks may also be badly affected and exhibit no outward appearance of disease until death suddenly takes place.

Treatment consists in dissolving 15 grains of powdered Catechu in a gallon of drinking water. This should be kept constantly in front of the chicks and should be changed every two days.

Prevention consists in the isolation of all ailing chicks and the thorough disinfection of quarters and runs. This may be accomplished by the application of a lime-wash solution made by adding two and one-half pounds of stone lime to a pail of water, to which is also added one-half teacupful of a good commercial disinfectant. This should be applied full strength with a spray pump, brush or old broom to all parts of the quarters, brooder houses, etc. The feeding troughs should be cleansed daily by scalding with boiling water, and special care taken to prevent the chicks from getting their feet in the feeding utensils or drinking fountains as the disease is transmitted from bird to bird in this way. The floor of the brooder houses should be covered with a coating composed of nine parts of sand and one part of air-slaked lime, and if the droppings are not removed daily, they should at least be mixed with a fair amount of air-slaked lime to insure proper disinfection. If the runs are not too large it is also advisabl to cover them with a thin coating of the lime and either spade or plow them up. The chicks should be kept away from all adult fowls and carcasses of dead birds immediately burned as burying only serves to keep the infection going from year to year.

THE HEN'S MOULTING PERIOD SHOWS HER UTILITY

Each year the hen goes through a physiological process known as moulting, in which the fowl sheds the old feathers and replaces them with new. This is a very serious drain on the vitality of the laying hen. Usually they cease laying entirely during the months of October, November and December. Where the late fall and early winter usually furnish cold weather, it is a period of extreme hardship for farm poultry unless they are properly taken care of. The New York State College of Agriculture has made some interesting findings regarding the moulting period of fowls. This may be summarized as follows:

1. The hen feathers more quickly in those areas which protect the vital parts.
2. From the incubator to the laying period, chicks experience at least four moultings, either partially or completely.
3. Hens frequently lay during the summer while partially moulting but seldom during the general moulting.
4. Young hens moult more quickly than older ones.
5. Hens moulting very late moult in less time than those moulting earlier.
6. Hens moulting very late give a higher yearly production than those moulting earlier.
7. Hens lose in weight while moulting.
8. Broodinss appears to retard moulting.
9. Starving the hens appears to increase broodiness.
10. Hens moulting early resume production more quickly after moulting than those moulting later.
11. Hens moutling early lay more eggs during early winter than hens moulting late.
12. The most prolific hens moult the latest.

It is thus seen that hens which moult late are usually the heavy producers. There is a lesson in this for every poultry keeper. Take proper care of the hens that moult late because of the cold weather. Such hens make excellent breeders in the spring and should be properly cared for. Tbis can be done by putting them into the house early and not allowing them to suffer from the cold winds.

The shedding of feathers is a heavy drain on the constitution of the fowl because it is necessary to manufacture a new coat. The making of new feathers can be greatly aided by feeding highly protein or meat foods. The ordinary grains like wheat, corn and oats do not contain enough protein. Meat scraps from the house or commercial beef scraps are necessary if best results are to be obtained. If a fowl is thoroughly chilled and thereby weakened by late moulting during cold weather, she will find it difficult to recuperate until the late winter or early spring. By giving her extra care she can be started laying much earlier in the winter.

Green Food for Poultry

During the late fall and early spring the addition of green food to the rations of the hens will well repay the efforts of the poultry keeper. This can be furnished in many ways. Green cut alfalfa, corn fodder, lawn clippings or clover are excellent green foods. If these are not available, roots, such as mangles or turnips, are very acceptable. Many good poultry keepers feed both. This, of course, is in addition to the regular grain rations. By using a little thought during the growing season enough of this material can be secured in a dark room or some place where light is excluded for winter consumption.

TUBERCULOSIS IN POULTRY

Subscriber Innes, Sask., writes—"We found a hen dead, but had not noticed her sick. Upon examination, we found a great many small, white granular substances on the membrane, between the skin and the flesh. These varied in size from mere specks to larger than the head of pin. A great deal of blood had collected between the skin and the flesh, toward the lower and back part of the body on one side, also the part of the liver toward this side looked as if it were in a state of decomposition. Otherwise, everything seemed all right. About the same time we noticed a hen lame. She died in two or three days. We found similar granules on the membrane, and the liver was a very peculiar color, though not like the other. Now another hen is lame.

"Hens have free range and are fed wheat and a little oats. Have grit, shell and charcoal before them. Sometimes have noticed droppings of a bright, yellowish color and frothy nature, this especially when they have been fed butter-milk. If this is a contagious disease, would chicks hatched from eggs laid by this flock likely to be infected? Would eggs be fit for use?"

Answer by Prof. R. K. Baker, University of Saskatchewan: The small yellowish spots which you mention as being present between the skin and the flesh of the fowls, and also the yellowish, cheesey lumps usually found in the liver, are indications of tuberculosis. With this disease diarrhoea is a frequent symptom, the droppings usually being bright yellow, and more or less frothy. Lameness is also one of the later symptoms. It is possible that the immediate cause of death was the hemorrhage described above. Tuberculosis in fowls is a communicable disease, though in flocks where the vitality of the stock is good, few birds seem to contract it.

I would suggest that you provide plenty of ventilation in the poultry house. This may be best done by the use of large cotton covered windows. The house should be thoroughly disinfected with some strong germicide. All birds showing symptoms of tuberculosis should be removed from the flock, and, unless they make a complete recovery, after a couple of weeks' special care, it would be safer to kill them and burn their bodies. For your own satisfaction, however, you should in each case open the bird to see whether tuberculosis is present in the liver.

Eggs laid by these fowls would usually be free from infection, though the vitality of the chicks hatched might be low. This year's chicks should be kept on range at a considerable distance from the old poultry houses and mature stock. The ground around the present house should be plowed up and sprinkled with lime. If possible a new house should be built to house this year's birds during the winter.

It might also be well to dispose of all the old stock. If the present house were left idle for one season and were thoroughly disinfected it would possibly be safe to use it again next season.

WATCH FOR MITES

Chicken mites, the night pest of poultry, may not always leave the fowls before daylight, as commonly supposed, but may remain in the feathers in such numbers as to make poultry possible carriers of this pest to uninfeted places.

To prevent the introduction of this serious pest in mite-free flocks by means of new stock, specialists suggest these precautions: Ne wstock not known to be free of mites should be isolated the first few nights and allowed to roost on new roosts wrapped with pieces of folded paper. The object of using the paper is to furnish a convenient place for mites to hide. The paper should be examined, and if mites are found, the fowls should be kept on these roosts five or six days, or until no more mites come off the fowls. Removing and destroying the papers and treating the roosts thoroughly with kerosene or crude oil, will prevent an infestation.

One of the most effective sprays for houses and roosts is a so-called wood preserver, consisting of anthracene oil with zinc chlorido added; the cost of this spray is about $1 a gallon, but twice the quantity may be obtained by reducing with equal parts of kerosene.

Pure-bred stock is the only material with which the farmer can work in the certainty that he is improving the quality of his work. The heredity of countless generations of selected blood is too potent to be ignored.

Costs No More Than a "Span"—

It seems almost impossible, but it is true that you can get a handsome, comfortable, speedy 5-passenger Ford motor car for no more than it would cost you for a span of good driving horses, a carriage and harness.

The initial cost of a Ford car is so small that every progressive farmer can readily purchase one.

And who wouldn't rather motor to town, to church, to the railway station, to the neighbor's, than drive? — especially when it is three times as fast to motor, more comfortable and less expensive.

The low cost of running the Ford makes motoring possible for the masses, where it was formerly a rich man's luxury. It makes motoring a matter of good business, especially for those whose time is valuable. And with labor so scarce no one needs the time-saving Ford so much as the busy farmer!

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

A PRAYER

Somewhere across the infested sea,
Serving the cause of liberty,
Dear Lord, is my dear son.
I know not how he fares tonight,
But keep him ever in Thy sight,
For I have but the one!

Thou gavest two to bless my life,
But one fell early in the strife—
My first-begotten son!
He with his comrades marched away,
And then a message came one day—
Dear Lord, I have but one.

Then, while so sorrowed and bereft,
Though only he to me was left,
I could not say him nay,
Who urged that duty bade him go—
His country called, he said, and so
How could I bid him stay?

But, O dear Lord, 'tis hard to bear,
With not another child to share
The hearth when day is done!
I can but kneel to thee and pray:
Be with him through the hellish fray
And keep thou safe my son!

I know the cause is good and true—
I know that suffering must ensue
Before the fight is won.
Yet bear with me, O Lord, this night;
Be thou my solace in my plight
And guard my only son.

—Reuben Goldsmith.

LIVING ON AN ALLOWANCE OR WITHIN THE INCOME

One must have a standard, consciously defined and recognized in order to choose successfully. A standard of life consists of those principles which guide one's motives and direct one's activities. We have standards by which we descriminate in music, art, and many other things. But who can define the Standard of Life readily? We may reveal it to others, in fact we are constantly doing so as we decide this or that. The great difference between a successful person who accomplishes much and one who never seems to amount to anything in particular, is the difference in which their standards of life have been made clear and conscious, thus becoming a vital, guiding factor in action.

We recognize innumerable varieties of standards as the result of varying education and training, advantages and opportunity, or the lack of them. False standards arise from failure to descriminate between needs and wants. There are conflicting opinions as to what vital needs are, although it would seem self evident that they consist materially, in those things which man must have to live under the best conditions, such as pure food, healthful clothing, sanitary houses, and those things which will minister to his highest intellectual and spiritual development. Through failure to distinguish intelligently the majority of people spend two-thirds or more of their income for what fails to bring them the best results in health and happiness.

We are too inclined to scorn the woman of former days because of their more limited horizons. We may profitably study their understanding of their conditions and needs, and the wise adaption to them which gave them an important place in the progress of their time. The women who succeed today in the use of larger opportunities are those who, like them, dare to live in intelligent independence true to her individual standards of life. Such women do not indiscriminately copy the manners of living or dress of others merely to be ilke them or in fashion. They are not ashamed to acknowledge a liking for home-making and housekeeping. They spend with care and judgment. A suggestive comparison between the women of the past and those of the present is that of Miss Richardson in The Woman Who Spends: "In olden times women thought, and thought and thought before they spent, often making the spending a burden. Now women often spend and then think and think and think. Nor does the lack of thought beforehand ease the burden of the results of her spending.

No true economy can be practised in the home until a standard is adopted by all the members of the family, in which there is an agreement of effort to promote the family well being; at the same time that all unite to accept with intelligent grace the common deprivations necessary to lessen family waste either of money, labor, time, health, strength, or possessions.

Only by keeping an accurate record of expenditures can one follow the outgo so as to find how the standards of the family measure up to the ideal. Without indisputable facts in black and white, one is easily deceived. It is natural to feel that economy is being practised when many a coveted article is resisted. The years bill with its record of many other indulgences is sometimes a rude but wholesome awakening. Twenty five cents today and another to-morrow for some luxury in food seems too slight to take accunt of, but multiplied by three hundred and sixty five the increase in the food expense becomes a considerable sum.

In making a classification of one's expenditures, it will be most useful to decide upon an experimental division of the years income under the heads that seem most valuable to keep as separate divisions. The actual per cent of the income allowed for each division will depend chiefly upon two things; namely, the size of the income, and the ideals or standards of the family. The necessities of life must be provided and if the income is small, barely enough to cover these needs, there is little choice left but to spend all for them.

Following are a few examples by Engel of ideal cases of proper division of income, for a family of two adults and three children.

Life Fam. Income.	Food.	Rent, carfare.	Operating expenses.	Clothing.	Higher
$3000-4000	25%	20%	15%	15%	25%
$3000-2000	25%	20%	15%	20%	20%
$800-1000	30%	20%	10%	15%	25%
$500-800	45%	15%	10%	10%	20%
Under $500	60%	15%	5%	10%	10%

Enlightment through education in real values is needed by all alike that correct divisions may be made and lived up to, and that the division for higher life, most often cut to a discreditably low percent, may be recognized and properly provided for. The best guide at present is a patient, thoughtful study of the problem's of one's own house until as equitable and consistent division is attained as can be made, meanwhile praying for speedy release from a condition so unsystematic and chaotic as that of the present time, and resolutely setting one's face toward the ultimate solution of some, at least, of the difficulties through better adaption of household management to the demands of the age.

THE VIRTUE OF SELF CONTROL

Who are the people whom you most admire and with whom you feel the happiest and the most comfortable? Surely not those who at every small pretext lose control of themselves in ungovernable fits of temper, or whose feelings are so supersensitive that you are in mortal terror of wounding them. Yet how many, many people there are who belong to one type or the other. It is certainly a great affliction, for such people are seldom happy. They are usually in the depths of despondency, either over the fact that some one has wounded them, or that in a spell of temper they have been too hasty and said things they regret very much.

One of a child's greatest blessings is to possess a calm, quiet mother, a mother who has judgment in teaching the art of self-control. This is an impossibility for many of us, as we well realize. Often though, there is back of this temper and sensitiveness a physical cause, some bodily derangement, that acts on the mind, and makes one just that much more susceptible.

A Debt to Others

But don't you believe that we owe it to our husbands, our families, our children and to ourselves, to do all we can to cure or overcome this trouble. I have in mind a charming friend who has poor health, and no one knows her real condition better than she does herself, yet she does the rashest things, things that, if she ever stopped to think, she knows will completely use her up, and still she does them. Then she pays the penalty by being laid up several days, often paying the doctor more than it would have cost to hire the work done.

Her physical tiredness acts on her mind, so that all times she is oversensitive, loses all control of herself, saying things she regrets almost instantly, making all her friends almost afraid of her and spending almost a whole day bathed in tears. She is the kindest woman in the world, ready to overdo for friends. No one ever came to her for help, but that it was always forth coming. Yet she cannot seem to realize that other people are kindly disposed and not just waiting to hurt her, or impose on her at every opportunity.

Examine Ourselves

Nor is this an isolated case. There is probably no one of you who does not know at least one or more persons, who are similiarly afflicted. The woman who possesses a fair supply of self-control, rarely "looes her head" or makes a grevious mistake. Her opinion may differ from anothers and she may state her position clearly, yet she has sense enough to realize that some one else has a right to her ideas as well as she, and no trace of anger is ever visible. Such are people upon whose judgment you can rely. It is such a comfort to be able to say to a friend, "She is so sensible, so calm, nothing ever upsets her." And how we long to have this said of us. But longing never accomplished anything. We must STRIVE and strive hard and continually, before gaining and holding this enviable goal.

FARMER'S REVIEW.

ECONOMY IN LEATHER

Attention is called by the government to the need of care in the use of leather.

Leather is demanded in war time for soldiers' 'shoes, for harness, for equipment of many kinds. In this country there is no such surplus that we can afford to waste any of it; and it is wasting leather not to care for and preserve it properly. In the army and out, we all wear shoes. If we manage them rightly they will last longer; we shall not need so many new ones and there will be more left for others. The Leather and Paper Laboratory of the United States Department of Agriculture makes the following suggestions.

To save shoes, they should be oiled or greased whenever the leather gets hard or dry. They should be brushed thoroughly and then all the dirt and mud that remains washed off with warm water, the excess water being taken off with a dry cloth. While the shoes are still wet and warm apply the oil or grease with a swab of wool or flannel. It is best to have the oil or grease as warm as the hand can bear and it should be rubbed well into the leather, preferably with the palm. If necessary the oil can be applied to dry leather, but it penetrates better when the leather is wet. After treatment the shoes should be left to dry in a place that is warm—not hot.

Castor oil is satisfactory for shoes that are to be polished; for plainer

foot wear neat's foot, fish oil, or oleine may be substituted. If it is desired to make the shoes and boots more water proof, beef tallow may be added to any of these substances at the rate of half a pound of tallow to a pint of oil. The edge of the sole and the welt should be greased thoroughly. There is no danger of applying too much grease to these parts.

A simple method of making the soles more durable, pliable, and water resistant, is to swab them occasionally with linseed oil, setting them aside to dry over night.

Many of the common shoe polishes are harmful to leather. All those which contain sulphuric, hydrochloric, or oxalic acids, turpentine, benzine, or other volatile solvents have a tendency to harden the leather and make it more liable to crack.

It is poor economy, too, to wear a shoe with the heel badly worn on one side. This throws the shoe out of shape and may soon result in its ruin. It is also likely to cause temporary injury to the foot.

We would add to these suggestions that the department that a further way to economize in the use of leather is to refrain entirely from buying the very high shoes, whose use has increased enormously the amount of material used; to wear low shoes as far as possible; to buy shoes of canvas or other material rather than leather; to use leather substitutes, some of which are very satisfactory, for new soles.

Do not increase the shortage by laying in a stock of shoes against possible emergencies.

"I HAVEN'T TIME"

I have no time to tell my children stories, I have not time to walk out of doors with the youngsters, I have no time to teach my girls at home. All these are commonly heard remarks from women whose occupations take their every available moment. Is there not some task these women can leave undone so they can make time to bring up their children? The men and women who have left their mark on this world have generally been those who have been brought up in a home where the parents had time for them.

The endless "why" and "wherefore" of children are the keys with which they find tongues in trees and books in running brooks. If children are snubbed and "shut-up" for six, eight or ten years is it a wonder teachers find it hard to get them to open up their minds to their efforts?

It is easier to send the boy or girl off to the library for a story than to tell it yourself, but a well told story can train senses to be accurate, eyes to be observant and tongues to be polite. It does take time to teach girls at home but what a serious waste of time to send your girl to be taught in a far away school when you overwork yourself for lack of her wasted strength

In a certain home, once upon a time, a great blank book was kept on a low table and to it was tied an always sharp pencil. Every evening someone wrote down some happening of the day, for it was the family's home journal. Sometimes father and mother would write an entire page together. Again Tom would scrawl a single line and on some happy days each one of the family would bend for a moment or two over the pages making a record in the book and in their own lives.

Years after many a hearty laugh rang out as the old note book was read and the heart throbs of childhood came again in visible shape. That was a practicable way of uniting the family.

No day nor hour that is great enough to claim the children's attention should be deemed too trivial for your interest. Some parents bring up their children by hard and fast rules, like platoons of soldiers. You must eat this or that, they etll them, because it is good for children. You must work, talk, play and dress along the same rules year after year, Sunday and Christmas are the only holidays in the calendar for them.

A recruiting officer told me that five soldiers out of every ten men enlisting had to look at a note book to be sure they had the day of their birth correct. Would this have been the case if their mothers had been among those who had time for son's birthday dinner?

DOMESTIC COURTESY

If a man must have his spells of crossness and unkindness, it were better if he gave vent to his feelings when dealing with strangers, and not at home with his family. Few have done more for the man than his wife and children and they deserve his very best treatment and kindest words. But is it really necessary to pass through these "spells?" A few efforts at laughing off diappointments and trials will have a tendency to sweeten life and fit a man for being kind to everyone. Even the stranger deserves better than you may give him, for who knows but what he may later wish to become your friend. No man has ever felt better after giving way to bitter feelings and cross words but everyone has felt pleased after he has been guitly (?) of doing some kind deed and giving out kind words. Love and kindness are two of the most need characteristics in mankind.

NUT BREAD

Four cups sifted flour, four even teaspoonfuls of baking powder, one teaspoonful salt, one cup of chopped English walnuts, two eggs well beaten, one-half cup sugar, two cups milk. Let it rise by standing in pans for 20 minutes before baking. Bake 30 to 35 minutes. This makes two loaves.

To Prevent Chapped Skin

—use warm water and Baby's Own Soap.

The warm water opens the pores of the skin and the minute particles of pure refined vegetable oils which form the creamy, fragrant lather of Baby's Own Soap are absorbed into the skin, keeping it soft, healthy, and preventing cracks and chaps.

A perfect rinsing, then smart rubbing when drying guarantees a fine smooth skin in any weather.

BABY'S OWN SOAP

Best for Baby Best for You

Canada's Standard toilet and nursery soap for over 30 years.

ALBERT SOAPS, LIMITED, - MONTREAL.

"No more Dyspepsia for Us!"

There isn't a member of the family need suffer from indigestion, sick headaches, biliousness, fermented stomach, etc., if he or she will take Chamberlain's Tablets. They cleanse the stomach and bowels and stimulate the liver to healthy activity and tone up the whole system. Take one at night and you're RIGHT in the morning.

All druggists, 25c, or by mail from Chamberlain Medicine Company, Toronto. 45

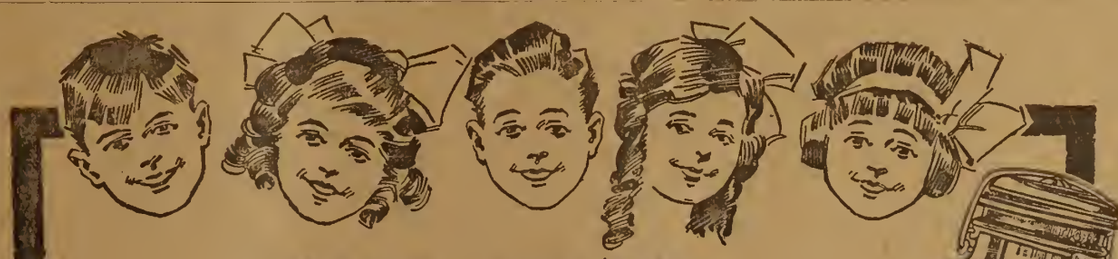
CHAMBERLAIN'S TABLETS

LAYING A RUG

There is as much art in placing a rug as in hanging a picture; if you lay a rug with its irregular lines and figures all converging from the centre obliquely across the floor, the result is a bewildering zig-zag effect; but place it square with the lines of the wall and the difference will be quite evident.

WASHING BABY'S STOCKINGS

After washing in the ordinary way, lay the stockings out flat and, beginning at the toe, roll them, stretching them crosswise. Wring them as dry as you can in this way, then unroll them and hang them to dry. If treated in this way, they will not shrink and the feet will be large enough.



CROWN BRAND CORN SYRUP

Children prefer it to the most expensive butter. Why not save money by using more of this syrup ?

In 2, 5, 10 and 20 pound tins—3 lb. Glass Jars.

HOW TO PROLONG LIFE OF SHOES

The following suggestions relative to buying and caring for shoes will, if fololwed, assist in getting the most wear from them:—

(1) Carefully fitted shoes wear longer than poorly fitted ones.

(2) Substantial heels do not wear off nor run over as easily as fancy heels. They are in good style and better for health.

(3) Patent leather shoes are not economical; their wearing quality is a lottery, and they are uncomfortable for hot weather; they are heat producing and unhygienic because they are non-porous.

(4) Plain, light weight, balck kid shoes are the most economical for dress wear. They are always in good taste, look well with any costume and wear well. The same requisites in low shoes hold true, especially when one pair must answer for many occasions.

(5) At the present time the price of the low shoe is practically the same ever, a better grade stocking is required and more of them, as the wear on them is harder, therefore the purchase of low shoes for street wear is questionable economy.

(6) While the supply of leather is limited why not create a demand for cloth tops which wear well and look well. Canvas shoes, too, have their place, require comparatively little leather and should be cheaper.

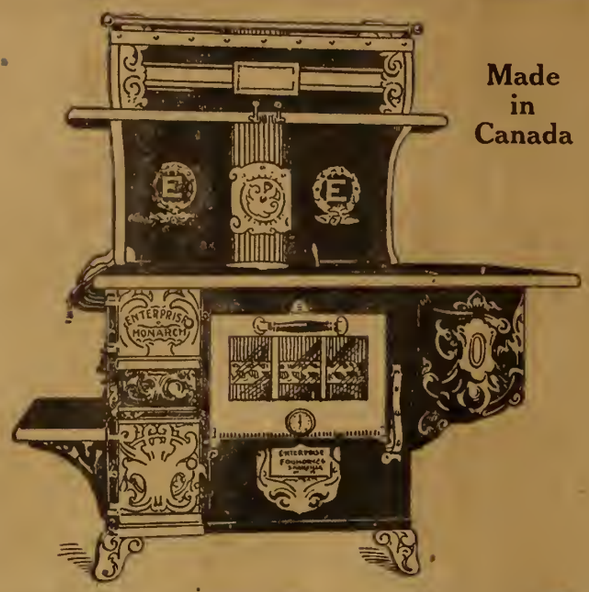
(7) Shoes wear longer when two pairs are alternated. Shoe trees help to preserve the shape when not in use.

(8) Keep the heels in good repair, otherwise the whole shoe soon loses shape. Have shoes resold as soon as needed.

(9) Wear rubbers in wet weather. This prevents the dampness from rotting the threads and the soles from separating.

(10) Keep shoes clean. Invest in a good polish and a brush and care for your own shoes unless your time is very valuable.

(11) Insist on your merchant supplying you with plain, neat, sensible styles. Do not buy the duddy types, because in the first place you pay all the way from 25 to 100 per cent. more for this class of goods. The manufacturer must protect himself against loss or left over, out of style stock, etc., and in the second place the life of a fancy shoe is shorter, the adaptability less and the upkeep and care very much more expensive in both time and money.



Made in Canada

ENTERPRISE Steel Monarch Range

MADE of finest steel plate, asbestos-lined, with every practical time-and-labour-saving improvement yet invented, the Monarch is truly a "king among ranges". Strong, handsome, durable, economical of fuel, it will give perfect satisfaction for many years of daily use. For coal or wood.

Write for booklet— free for the asking.

Enterprise FOUNDRY CO. SACKVILLE, N.B.

HELPFUL HINTS

Washing in cold water when overheated is a frequent cause of pimples.

It is said a wart can be removed by touching it several times a day with castor oil.

Cover raisins with water when stoning them. This prevents stickiness, and cleanses the raisins.

It is good economy to take time to keep the hands in good condition. Use small mops. brushes and paddles for every possible kind of work.

Cut the old table linen into small pieces and keep it in some handy place in the kitchen to use in greasing cake and bread pans, then burn. This saves time and greasy fingers.

Lemon juice is good to remove stains, and pumice stone for scouring grime off the hands. It is always the part of wisdom to take the very best care of these, our bodies.

People troubled with chronic sick headache will be glad to know that sleep, if taken at the psychological moment, will prevent the attack. If the subject of sick headaches will watch the symptoms they will note that it begins with a feeling of weariness and heaviness. This is the time to sleep an hour, or even two, and it will eventually prevent the headache. When the attack is fairly under way, sleep will not prevent it.

SHORT CUTS IN HOUSEKEEPING

Clean aluminum ware with a cloth dipped in lemon juice.

The only hopeless sorrow is the one that shuts itself up in self.

Discolorations on teacups disappear under vinegar and salt treatment.

Frankness may or may not be a virtue. Much depends on the spirit back of it.

If you want to cool a dish of food quickly, set it in a pan of cold salt water.

The worst thing about an excuse is that we deceive ourselves when we make it.

Remember that entire failure is not possible when one honestly tries to do her best.

Tell your friend at the seashore to bring you a round, hard clam shell for a pot scraper.

Fruit gathered just after a rain jells more slowly than that gathered on a bright, dry day.

It is often quite a consolation to remember that those who work for money alone get only what they work for.

It pays to keep the kitchen cupboards and drawers neat day by day. They should never need a thorough cleaning out.

Has the fire gotten down to coals and you want a pressing iron quickly? Set a stove lid on the coals and the iron on that.

The method of putting up cabbage by fermentation has a number of advantages over the present process of making sauerkraut.

Each day put a fresh slice of bread (removing the stale one) in the cake box. The bread will dry and the cake remain fresh.

An empty lard pail of the right size, turned upside down on the closet shelf, makes a good hat rack, keeping both crown and rim in shape.

To make buttonholes on lace put tiny squares of lawn underneatth and work through it. When the buttonholes are finished cut the lawn away.

If filling is needed for couch or hammock pillows, cut cotton batting into small squares and fluff to twice their size by putting in a warm oven for half an hour. Be careful not to scorch.

If dried fruit has become wormy but is not hurt, put in kettle, cover with boiling water for a few minutes, then pour off water and dry fruit.

Before covering button moulds that are to be covered with wash material, boil them, then the coloring matter in them will not spoil your buttons by coming through when the garment is washed.

Never iron or press corduroy. If wrinkled turn wrong side out, dampen thoroughly and hang carefully to dry. If it has been washed, press water out but do not twist or wring, then hang on line or coat hanger to dry and shake a little to fluff the nap.

RENOVATING WINDOW SHADES

Three years ago our window shades seemed practically done, but before buying new ones I thought I would see what paint would do on them, as there was some dark green paint in a can in the granary. I mixed the paint fairly thin with turpentine, laid the blinds on the granary floor and daubed paint on all the thinnest spots, then gave each side two coats, letting them dry between times. I went over the lace on the bottom, too, and they were almost like new, and are still on the windows and good for years yet.—M M.

THE SIGNIFICANCE OF HOME MAKING

For most people the home is the beginning and the end of life. All their activities proceed from it and return nto it. Therefore, of all the arts those pertaining to home making are the most important, and of all the sciences those which find their application in the home, making us in telligent about the home and its needs are the most significant.

Home making is universal, that is there are workers of all classes and intelligences engaged in its occupation. But the woman who is the most successful in making a home is in every sense engaged in a learned pro-

HEART WAS BAD

WOULD WAKEN UP IN DISTRESS.

There is nothing that brings with it such fear of impending death as to wake up in the night with the heart pounding and thumping. This uncertain and irregular heart action causes the greatest distress of both mind and body.

Milburn's Heart and Nerve Pills strengthen and invigorate the heart, so that it beats strong and regular, and tone up the nervous system so that the cause of so much anxiety becomes a thing of the past.

Mr. Archie Beaumont, Edgett's Landing, N.B., writes:—"Have been bothered with my heart and nerves for about six years, caused by overwork and worry. My heart was so bad I would waken up several times during the night in great distress, and my heart thumping. About a year ago I took three boxes of Milburn's Heart and Nerve Pills, and they helped me a great deal."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

A MESSAGE TO WOMEN!!

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

PULVERIZED LIMESTONE

SWEETENS THE LAND AND PRODUCES HEAVY CROPS

The demand last season for our "Clairmont" Brand Pulverized Limestone was so heavy we were unable to fill a great many orders. We expect a very heavy business for 1918 and would advise all booking now and getting their supply early. Our Limestone is showing wonderful results.

—Manufactured by—

C. H. PETERS SONS, LTD., St. John, N.B.

Works at TORRYBURN, on C. G. R.

fession—the greatest one on earth. For she has to initiate, plan, direct and carry out operations which involve in greater or less degree all the sciences and arts known to man. She also deals with those subtle spiritual powers which make or mar his personal happiness and influence his soul's salvation.

Housekeeping should be ranked as a profession instead of a trade. One who works at a trade does an assignment planned by someone else who resumes the responsibility. A housekeeper is a director of home, she plans the work and looks after the spending of the money. This must be a business and requires qualifications. The woman who considers this work as an opportunity to assist in haring the responsibilities of the wage earner has grasped the truth concerning the possibilities of her work.

Unfortunate is the home where the practical experience all comes after marriage. It comes at the hardest of periods and is unjust to any man. In no business can failure be graver or the results more serious. The fact that some very efficient housekeepers have evolved from unpromising beginners is no argument; such are, without exception, most eager for their daughters to receive training, since they know, by dear experienc, its value. Our grandmothers, many of them, were beautiful housekeepers and splendid mothers, but they learned their lesson in the hard school of experience and with the price of much unnecessary suffering. The young women of today have no excuse for answering "not prepared" when life demands that she assume her place as homemaker. Can anyone feel that this important work should be undertaken at marriage by girls who rely for preparation upon chance occupation at home supplement by the much-abused "mother instinct?" There should be no more question as to the need of education and training for the woman who selects the food, clothing, and works of art which minister to the highest welfare of a family, than there is for the need of study on the part of the farmer, manufacturer, or the artist.

Much of the present aversion to household duties would vanish before adequate preparation to perform them. It is very true that when one's knowledge of a subject has passed the stage of drudgery and become a science its performance immediately becomes a pleasure. The essential thing for all to learn is to love their work, to see its possibilities as well as its difficulties, and to make their work their servant, instead of their master. This can be done by the homemaker as well as by the physician.

FIRST AIDS IN THE FARM HOME

A farmer cannot make a trip to the druggist every day, therefore it is essential that in the farm home the medicine chest should be wel lstocked. Before the last of anything is used a new supply should be purchased. In case of serious illness or accident, a doctor should of course be called, yet very often it is almost impossible to get a doctor and often for those living far from a city it takes some little time for a doctor to arrive.

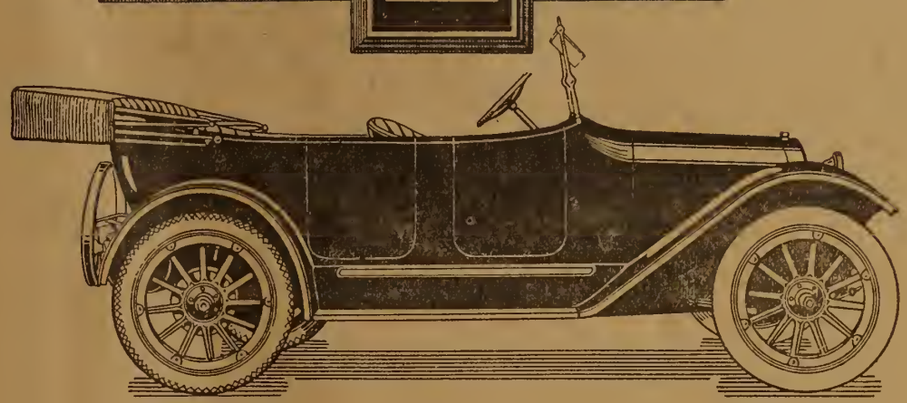
To remain calm in the face of the unusual or the unexpected is a test of character, yet in case of an accident it is most important that we remain calm. We will do harm if we do not keep our nerves steady. A mother once jerked a crochet hook which had caught in the flesh of a child's mouth. The flesh was torn and bled profusely. It might have resulted seriously had it become infected. The child (unknown to the mother) had got down some crocheting and began playing with the hook. Child-like she had put it in her mouth. When it became fast in her gum she ran crying to her mother. The idea that came to the mother was that the hook must be removed at once. Had she wiggled it around carefully and pushed the other way just a little, it might have come out easily. Instead she became alarmed. The first thought that occurred to her was to jerk it out and jerk she did.

If we were to write out a list of remedies and place it where we knew we could find it quickly we might do much toward making the sufferer more comfortable. In case of burns, soda, vaseline or lard is good. Never attempt to tear clothing from burned flesh, but rather cut around it and then bathe. We can do little at home to help broken bones but we can get the sufferer into a comfortable position to await the doctor's visit. For sprains a comfortable position and quiet is essential. The application of very hot cloths will help reduce the pain. For bruises apply either arnica or witch-hazel. In cases of poison a list of antidotes will be found in a physiology. Wine of ipecac is good to produce vomiting. Greatest care should be taken to keep bottles containing poison away from children. When a foreign particle lodges in the eye tears will often wash it out. Some are quite skillful in laying the eyelid back and with the aid of a match of toothpick removing the speck. In case of fainting the person can be revived by sprinkling the face and neck with cold water. Wounds demand the greatest of care for they may become very serious. **Apply iodine and keep** the patient quiet. Wounds which break the skin may result in blood poisoning unless care is taken to keep them from becoming infected. Nothing should touch the wound excepting that which has been sterilized.

The following fourteen articles are necessary in the home medicine chest: Absorbent cotton, adhesive plaster, ammonia, arnica, bandages, castor oil, gauze, iodine, listerine, mustard, turpentine, vaseline, wine of ipecac. witch-hazel and peroxide.

ANNOUNCING A NEW

CHEVROLET



MODEL "F-A"

"Baby Grand" Touring Car

THE demand for Chevrolet performance in a larger and more powerful car is met by the Baby Grand Touring Car.

Chevrolet engineers have, in this car, perfected many new features that give it a quick get-away, surplus power on hills, and reliability under all road conditions.

On account of its power, flexibility, comfort and easy clutch, this model appeals to lady drivers. The car is extremely well finished, nicely appointed and fully equipped.

EXCLUSIVE FEATURES

37 H.P. 4 cylinder valve-in-head motor, extremely powerful, smooth, flexible and efficient.

Cooling—Water circulated by centrifugal pump through large honeycomb radiator.

Clutch—Cone type, extremely easy to operate.

Brakes—Positive in action and easily operated.

Rear Springs—Semi-cantilever, making the "Baby Grand" one of the most comfortable riding cars.

Rear Axle—Three-quarter floating type with spiral driving gears:

Starting and Lighting—Electric Auto Lite.

Ignition—Remy.

CAUGHT COLD NEGLECTED IT

WAS SICK FOR MONTHS.

You should never neglect a cold, however slight. If you do not treat it in time it will, in all possibility, develop into bronchitis, pneumonia, asthma, or some other serious throat or lung trouble.

On the first sign of a cold or cough it is advisable to cure it at once, and not let it run on for an indefinite period.

For this purpose there is nothing to equal Dr. Wood's Norway Pine Syrup, a remedy that has been universally used by thousands for over twenty-five years.

You do not experiment when you buy it.

Mrs. W. G. Paquet, Smith's Falls, Ont., writes:—"I was troubled with lagrippe. I caught cold, and neglected it, and was sick for several months. I took three bottles of Dr. Wood's Norway Pine Syrup, and before I finished the last one I was entirely cured. I would not have any other cough medicine in the house.

It also cured my baby, who was very sick with bronchitis. She had the doctor three times, and he recommended 'Dr. Wood's.' I highly recommend it to those who need a quick cure."

See that you get Dr. Wood's Norway Pine Syrup when you ask for it. Do not accept a substitute. It is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c.; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Butter Parchment at Farmer Office

COLORING COTTON WITH COPPERAS

Editress Household Dept.:

Will you please publish a recipe for coloring cotton with the old-fashioned copperas color, also tell how to color tan with tanbark? What shall I use to set the color?

Carleton Co. SUBSCRIBER.

Ans.—Subscriber's enquiry with regard to old-fashioned dyeing is opportune at this time of shortage in commercial dyestuffs.

To color cotton copperas, dissolve one-half pound of copperas in a pail of hot water, in an iron kettle, as copperas is the sulphate of iron. Also have a pail full of white lye prepared. First dip the rags in the lye, then hang them up to dry, then dip in the copperas water, drying each time after dipping until the desired color is obtained. This lye is made from good hardwood ashes and is used to set the color. To color tan with tanbark (we presume the tanbark to be oak or white birch) fill a five-pail brass kettle with small pieces of oak or birch, let steep twenty-four hours and not boil, then skim out the bark, wet the cloth in soapsuds, then put it in the dye, stir well and air often; when dark enough dry, then wash in suds. It will not fade. A piece of copperas as large as a hazelnut or chestnut according to shade desired will give a stone color.

In coloring keep watching and moving the goods till the desired shade is obtained. If left folded or packed it will be spotted, whether the fabric be cotton or wool. In dyeing cotton or mixed goods the cloth should be allwed to become cold in the dye bath. Dyes set very slowly in these fabrics, so the cooling process is necessary to success. Woollens absorb the dye quickly and may be removed while hot when the shade desired has been obtained. Woollen goods should never be allowed to boil fast. Linen requires long and fast boiling. Never wring dyed articles too firmyl and always dry in the shade. The dfeing process goes on until the article is dry. Consequently any portion exposed to the sun will dry too quickly and the result will be a streaky garment. All goods must be thoroughly clean, well rinsed and damp when put into the dye. The action of metals affects the color.

SOME ESSENTIALS TO THE SICK ROOM

Even in this day when trained nurses are plentiful, the mother or sister must often be the "ministering angel," in times of sickness. Even the woman who seems to be naturally skilled in "comfort art" will value a few hints.

Make the sick-room attractive.

Give the invalid the best room in the house, and one as far removed as possible from the noise of the household machinery.

If possible, put the invalid in a room the walls of which are covered with plain paper, for a nervous patient is often driven almost frantic counting the roses or patterns on the wall.

Keep the room well ventilated and tidy. Never dust with a feather since that merely agitates the dust to the annoyance and danger of the patient.

Avoid disagreeable topics of conversation. Tell no depressing news in hearing of the patient.

The first requisite of a sick-room is a good bed. Cover the mattress with a thin, soft covering. Make the bed carefully, draw the undersheet tightly, smooth at the sides and pin down the corners with safety pins. This will prevent the sheet wrinkling. Never place the bed so the light will fall in the eyes of the invalid. Have a number of small pillows to tuck under the knees. For temporary use cover the pillows with cheesecloth.

Before serving food, bathe the invalid's hands and face and freshen the air in the room.

Never argue with the invalid but be patient and fism.

Grapes

green or ripe, in jelly, spiced conserves, or simply preserved in light syrup, make a delicious and inexpensive addition to your winter supplies.

Lantic Sugar

"Pure and Uncolored"

is the ideal sugar for all preserving, because of its FINE Granulation.

TO PROTECT FINGERS

Here is a little device which you can make at home by which the tiniest tack can be held without possibility of injury to the fingers. Take a strip of tin about three-quarters of an inch wide, and about six or seven inches long. Shape it with a small slot in one end. Then double it, bending at the middle. When ready to insert the nail, put it into the slot, which will hold it by its head. This gives a kind of handle by means of which you can hold the nail perfectly upright while you hit it with the hammer. Of course the holder must be pulled away before the nail or tack has gone all the way into the wood. If you have not the tin at hand strong cardboard will serve the purpose. Try this little device just once, and I am sure you will feel amply repaid for your trouble in making it, as it will prevent many a bruised finger.

WHITE SPOTS ON VARNISH

If white spots come on the varnish from hot foods or drinks or from acids, there are two or three methods of removing the stains. One is to hold a hot flatiron near them. This takes out the white mark, but impairs the varnish, which must be renewed or the spot rubbed down with oil. Another plan is to rub the spot first with wood-alcohol and then with a piece of flannel moistened in camphorated oil. Turpentine and linseed-oil, mixed in equal parts, also make a good polish for white spots on furniture.

RE POLISHING TABLE TOPS

If your table top is badly injured so that it has to be done over, have it rubbed down with sandpaper in the hands of some one who understands the work and then use polish on it. Patience will be required, for at first the table will not look well. It will take some weeks of faithful rubbing with a good polish of wax to make the top presentable, but then there will be a surface which will last and which will not show white spots, no matter how hot the dishes placed upon it. Such dishes will, however, leave a ring where they have touched and for that reason the table should be adequately protected.

KEEPING THE HAIR IN CURL

Here is the most successful curling preparation that she has ever used. In the warmest summer days it will keep the hair lovely and wavy three and four days with one application.

Buy from the druggist one-half ounce of quince seeds. Put in bowl about 10 seeds and two ounces of hot water. This will thicken in a few hours, then you can drain off the seeds and add a toilet water if you wish. Dampen the hair with this and do it up on hair curlers until dry.

The daily use of the curling iron will often cause the hair to become harsh and broken. This is caused by the heat taking away the natural oil. See that the iron is only moderately hot or abandon its use altogether.

Even a cheery disposition must use judgment. There's some hope for the fellow who grieves over his mistakes, but none for the grinning fool.

In the finest households in the land where *baking* results alone are *the* thing that counts, and also in the poorest families where *economy* is an absolute necessity,

"REGAL" FLOUR

Stands First

THE COUNTRY WOMAN AND DOMESTIC SKILL

The value of wholesome cooking can never be over-emphasized. There is nothing to enthuse one where poorly coked food, unattractively served up, greets the family or the visitor in a country dining room. Aboe all persons the country woman should excel in the art of domestic and table economy. Here are a few hints for the busy wife:

FLANK STEAK BRAISED WITH VEGETABLES

Score a flank steak, dredge with flour, sprinkle with dots of dripping, salt and pepper, and place in a roasting pan. Over this place a layer of sliced onions, salt and pepper again, and a layer of sliced potatoes. Put some sliced carrots or diced turnip in the pan and around the meat, add two cupfuls of water or soap stock, cover closely and and cook in hte open for two and a half or three hours. Half an hour before the meat is done remove the cover to let the potatoes brown.

In serving, carefully lift the steak to a hot platter, preserving the contour of the layers of vegetables. Garnish with the carrots and turnips. Slice down through the layers.

BEEF WITH LIMA BEANS

To make a small quantity of beef go a long way for a hungry family, it may be combined with lima beans. (This isn't on a par with the practise of diluting with water as the beans are richer in proteid than the meat.) Soak a pint of dried lima beans over night, drain and simmer till the skin bursts. Cut a pound of chuck beef into inch cubes, brown together with a sliced onion in two tablespoons of beef dripping. Place in alternate layers, with beans in a casserole or covered baking dish. Sprinkle each layer with salt and pepper, a tablespoon of sugar, and a little mace. Barely cover with boiling water or use two cups of stewed tomato for part of the liquid. Cover and cook for three hours replenishing the water if necessary to keep the beans moist but not too liquid.

PORK AND VEGETABLE PIE

Cut a quarter of a pound of salt pork in small pieces and put a layer in the bottom of a baking dish. Slice about four cups of raw potatoes, one cup of turnip, and two small onions. Place in alternate layers with the pork and simmer on top of the stove till the vegetables are tender. Season with pepper and salt if necessary, drain off the liquid and thicken with flour. Pour this back over the vegetables, cover with a pastry crust and bake in the oven.

POTATO AND ONION OMELET

Prepare a quart of mashed potato, seasoning it with three tablespoonfuls of bacon fat, a little pepper and half a cupful of hot milk. Add two cupfuls of boiled onions, chopped fine, and beat until light, then spread smoothly in a frying-pan containing two tablespoonfuls of melted bacon fat, and cook until well browned. Fold and turn on a hot platter.

PLAYTIME DRESSES FOR THE CHILDREN

Children should be sensibly clothed for play, for there are few of them who enjoy being dressed up unless on special occasions. And it is positively cruel to punish youngsters for soiling their clothes when turned loose to have a good time.

There is trouble ahead for the mother who expects to dress even one small child daintily in white from top to toe and get it through in an hour's time without a smooch somewhere unless compelled to sit meekly in a chair. Far better to accept results as they come than be constantly nagging about its clothes. White stockings, just now so popular for little folks, look nice, but as to keeping them clean; there's the rub. And what preserve of pepaexe aq uno pnoo their immaculate condition for any length of time beyond when the impulse comes to get down on its knees somewhere where there is sure to be dirt.

Sensible parents are now making full gathered bloomers like the dresses for girls and doing away with white drawers entirely for everyday wear. This also makes the petticoat unnecessary. Nightics are made of crinkled crepe for the summer, either white or figured. Pink and blue in solid colors are also pretty for this use. Many grownups use them too. They wash easily and require no ironing if carefully hung up by the hem to dry. Where there are two or three children to povide for, white makes a lot of work for someone to do.

In the average home everything falls to mother's hands in making and laundering. It more sensible in such cases to draw the line at white hose except for special occasions and be content with black or tan. A pretty gingham or chambray should likewise be substituted for the white dress.

"It is just a little bit o' brass," laughed a Saint Louis girl who keeps house, "but it is a useful little bit. I use it to scrape my dishes before cooking dishes, pot and pans and such I wash them and particularly my things. It can be kept clean so much more easily than one of those wire things or any other arrangement that I have had. It is just a plain, smooth, oblong piece of brass with a small hole in it, and it has smooth edges too. There is nothing to catch or hold any dirt. It does not cut like a knife nor scratch, but removes just what it is supposed to remove and leaves the rest. Moreover, it is not only useful, but decorative too, hanging there over the sink by the window, where the sunshine makes it look like a square of gold."

More Money for the Farmer

WHEN live stock is tormented by vermin, lice, mites or flies, it cannot be profitable. You can prevent this annoyance and have more profitable stock by using Creonoid. Think this over. It means money for you.

CREONOID

Lice Destroyer and Cow Spray

Creonold stands alone as a lice killer and cattle spray. Economical too, because it is so strong that a little goes very far. Give your horses and cattle a fine, long distance spraying, so that they get the vapor. It will make them clean and vermin free. Put some Creonoid in the hennery and piggery. The use of Creonoid means better stock, more eggs, more good porkers, more milk. Try some now.

"Look for the Roll with the Paroid Label"

The Largest Manufacturers of Roofing, Wall Board and Roofing Felt in Canada.

Have your Roofs this Protection?

HEAD and shoulders above all other roofings stands Paroid, which not only defies the weather, but resists fire. That is real protection, and explains why the Canadian Government and the railways have used Paroid.

NEPONSET Paroid ROOFING

has been giving all round satisfaction for 19 years. The genuine Paroid makes farm buildings warmer in winter. But remember—there is only one genuine make of Paroid—Neponset Paroid, with the label as shown. It has the grey surface. We also make two finishes of Slate Surfaced Paroid—Red and Green, permanent colors.

Every roll carries a complete kit inside, and has our unconditional guarantee.

For your home, use Neponset Twin Shingles, surfaced with crushed slate, Red or Green; they give all the durability and protection of Paroid. Look for the Neponset dealer and get real satisfaction.

8 IN. REVERSIBLE PLATES

We are going cut of the Grinder business and have a few left which are being sold at a bargain price. Write us, it will pay you.

If you are in the market for any of the above articles, it will pay you to get our prices.

Remember we also manufacture the Sussex Little Giant Thresher and have a few second hand threshers on hand, which will be sold at a bargain. Sussex Wood Cutters are the best. Watch for our next add.

THE SUSSEX MANUFACTURING CO., Ltd., Sussex, N. B.

THE WAY TO SUCCESS IN FARM BUSINESS IS TO ADVERTISE YOUR PRODUCTS

A great many people ask me: "Does farm advertising pay?" After 15 years of almost continuous advertising I should most assuredly say that it does pay. It is an investment that when carefully and judiciously managed, pays well.

Advertising pays the manufacturer, and the wholesale merchant, as well as the retail merchant. It pays the business man, no matter what line of goods he carries. It pays the farmer and poultry raiser as well as the business man, if properly managed. If you have good stock to sell that you know has merit, don't hesitate to let others know it. There are those who are just as eager to buy as you are to sell, but they will not buy of you unless you let them know what you have to sell. If you were the only person in the world who had stock to sell it would be unnecessary for you to advertise. Advertising is necessary, owing to the simple fact that "there are others."

The first question naturally arising is how best to do it. Go at it just as you would any other business venture; study the question carefully and begin. If you make a mistake, profit by it and try again, starting with the idea that advertising is an investment and not an expense. When selecting a medium, by all means choose a journal along your lines of business. An agricultural paper like The Maritime Farmer, if you are a farmer, reaches just the class of people who are interested in the very thing you have to sell, otherwise they would not be reading it. Select a paper that has been well established, is reliable and has a good circulation. Let this point interest and influence you more than the rate charged for space. The cost of an advertisement is not measured by the price alone, but by what it brings. Some advertising is cheaper at $4 an inch than others at $4 a page. No reliable paper charges a good rate for its advertising space without having a good reason for so doing. Cheap space may be too cheap in the end. That the best is the cheapest in the end is as true in advertising as in everything else.

Having selected your medium and arranged for space, do not make the mistake of trying to crowd too much into it. To many advertisers are careless in their preparation of an advertisement; they seem to think all depends on the medium, but this is not so. Here, too, the man behind the gun is an important factor; there are some things for which he alone is responsible. Anyone can attract attention, but it will count for nothing unless attracted in a pleasing manner. An attractive advertisement is just as far in advance of a poor one as the decorated show window is ahead of the one filled with last year's goods and fly paper.

Having decided where and how to advertise, the next question that confronts you is when to advertise. The best time to advertise is all the time. Spasmodic attempts do not count very much in any line of work; they count for little in advertising. Of course, you will see your first advertisement, but it does not necessarily follow that everyone else will see it, or your second one either. A few people will see one and others will see next one, etc. It is the everlastingly keeping at it that brinys results. People think before they buy; some of them have to do a great deal of thinking before spending their money. They will not think about what you have to sell unless they know about it. They have no way of knowing what you have to sell and how good it is unless you tell them by advertising. By all means keep before the public all the time. It will pay better to use less space and use it continuously than to use a large space occasionally.

Simply giving people your address and price will not go far towards convincing them that you have just what they want. Tell them some of the merits of your stock this month and tell them other good points next month, or tell about the same points in a different way. A business-bringing advertisement must interest people. What interests some today may not interest others, but by changing your advertisement you may interest next month the very people you missed last month. How long would you read a paper that printed all the same matter each week? Not long, I think; you would not be interested in reading that which you had read.

Some people have the idea that when they have sent copy for their advertisement to the publisher, all they have to do is to wait for the rush of orders. If the orders fail to come, it is the fault of the publisher and his "old paper." As a matter of fact, the publisher is just as anxious for your advertisement to pay as you are, and he will do his part toward making it pay, but it is up to you to help. See to it that you frequently furnish changes of copy and that you always stick to the truth. Truth and success are synonymous terms in this matter. It is not enough that people read your advertisements; they must believe them. Truth is always tellable and it will always prove the best policy. Unfortunately there are occasionally a few advertisers who wander from the truth, but there comes a time when their advertising does not pay. If you tell the truth and keep telling it, people are bound to believe you after a while and your advertising will pay.

Remember that every enquirer may be your customer. Give him the attention that you would if you were positive that his first order would be a big one. Go after, and keep after him with the intention and determination of selling to him. Do it in a business-like, convincing manner, and if he finds the goods as represented his second order may be a big one. If his first deal with you is a square one, he will be sure to come again; then he will bring his friends and they will, in turn, bring their friends. People are always willing to pass a good thing along. Treat your customers so that they will pass your name along instead of "passing it up." Fill each order so that it will be like a lucious peach, complete in itself, but tasting like more.

Advertising is a business wonder-worker, but there are no cases on record where it has ever furnished the get-up-and-hustle-ativeness for the advertiser. The advertiser who lacks this element always has time (plenty of it) to tell just how and why he knows why advertising does not pay. He who possesses this necessary requirement is always busy, but will assure you that advertising does pay because he has tried it and speaks from experience.

Whether or not your advertiseing will pay depends upon yourself to a great extent. Go at it with the determination of making it pay and the dollars will be yours. And don't put it off—try it at the first opportunity.

SHERWIN-WILLIAMS
PAINTS & VARNISHES

Get the Varnish that is made to do what you want it to do.

MAR-NOT
For Floors

Made for floors—to be walked on and danced on, to have water spilled on it, and furniture dragged over it. MAR-NOT is tough, durable, absolutely waterproof. Dries in 8 hours; will rub and take a high wax finish; pale in color; particularly desirable for fine hardwood floors.

SCAR-NOT
For Furniture and Woodwork

has been the means of converting thousands of women to the idea of protection in the home. They use SCAR-NOT to make their furniture, etc., fresh and pleasing,—even boiling water will not affect it.

REXPAR
For Outside Work

Made to protect outside doors, boat decks, spars, store fronts, etc., against every kind of Canadian weather. It is absolutely waterproof and will not turn white, no matter how long exposed.

The Sherwin-Williams agent in your neighborhood has the right varnish for your purpose. Ask him.

Color schemes and suggestions for any part of your building furnished by expert decorator, free upon application and without any obligation.

Send for book—"The A. B. C. of Home Painting"—written by a practical painter, and telling how to paint, varnish stain or enamel every surface in and around the house. Mailed free anywhere.

W. A. ERB, SUSSEX, N. B.

ASSISTANCE TO EXHIBITORS OF LIVE-STOCK

In view of the fact that it is impossible to hold the regular Winter Fair at Amherst, the New Brunswick Department of Agriculture will duplicate any prizes won by exhibitors of horses, cattle, sheep, swine or poultry at the Guelph or Ottawa fairs to be held this coming winter.

Exhibitors must secure a statement from the Secretary of the fair, showing the number of prizes won, the amount of each prize and in what class or classes the stock competed; upon presentation of these statements the necessary checks will be issued.

Further information can be had from the Secretary for Agriculture, Fredericton, N. B.

EXHIBITION AT SHUBENACADIE

This was a real farmers' and schools' exhibition of a high order, that is, the exhibits were large in number and very satisfactory as to quality, and the exhibition possessed different educational features.

Again, the attractions were free of anything of an objectional nature, that is, the grounds were not half filled, as is too often the case, with sideshows and sharpers whose influence is anything but uplifting. In fact the main centre of attraction, after the judging of stock and other exhibits was completed, was the "Pulling Match", which consisted of trials of strength between heavy draft horses, light draft horses, and oxen. Whether this possessed any other real merits or not, it was at least interesting and clean entertainment. We would suggest in connection with this, that it would be a good idea to give the judges the power to prevet competitors from overtaxing their animals in the contest.

Live Stock

The exhibit of poultry was good, all of the chief breeds being well represented.

There must have been well up to three hundred head of cattle shown, made up, mainly of pure bred and grade Holstein and Guernsey stock with a sprinkling of Shorthorn and Ayrshire. This is indicative of the strong trend of farming in this district, from which large quantities of milk and cream are shipped to Halifax and elsewhere. There were several animals that would make a creditable showing at any Exhibition.

Childrens Exhibits

In home garden work between fifteen and twenty schools were represented, and the exhibits of fruit and vegetables in no way suffered by comparison with the exhibits in the same building by the grown-ups. In these exhibits were potatoes, turnips, beets, mangels, carrots, parsnips, citron, pumpkins, celery, corn, cabbage, cauliflower, onions, leeks, cucumbers, tomatoes, pease, beans, radishes and salsify.

Among the lines of manual training and domestic science there was shown a fair exhibit of bread, cakes, canned and preserved fruits and pickles, and quite a full exhibit of needle and crochet work possessing considerable merit. One quite large room was completely filled—both walls and tables—with exhibits of writing, drawing, and sketching and collections of native woods. Much of this work was of a high order. Collections of butterflies, moths, insects, ferns, mosses were quite numerous, instructive and attractive.

It is gratifying to see our exhibitions taking an active interest in furthering the cause of the new and common-sense ideas in the education of our children.

A very sensible feature of the "War Time Lunch" furnished in the grounds was, that it consisted of good bread and butter, pie, tea and coffee and eliminated the use of meats.

The spirit of co-operation between Shubenacadie and Stewiacke in holding the exhibition at these points in alternate years is something to be commended.

Assistant Agricultural Commissioner,

BLACKHEAD IN TURKEY

Blackhead in turkeys is caused by a parasite and is characterized by great sores in the caeca (blind intestines) and liver. This miscoscopic parasite causes irritations, destruction of the tissues, and nearly always the death of the turkeys. The characteristic symptoms of the disease are summarized as follow: The loss of appetite and tendency of affected birds to stand apart from the rest of the flock is common. When the intestines are severely affected the birds have diarrhoea and the droppings are liquid and stained orange yellow; this is a characteristic symptom. Diseased birds are frequently found dead under the roosts.

The only sure means of diagnosis, however, is by post-mortem examination of a bird that has recently died. The bird should be cut open to expose the internal organs, and the liver and caeca examined. The presence of large sores in the substance of the liver and in the caecal walls is sufficient evidence for a diagnosis. The caecal sores may vary from a single point to large scabs covering nearly all the lining of both caeca. The liver is very much enlarged, and the sores on it are two-fifths to three-fifths of an inch in diameter.

At the present time there is no known cure for this disease, and the only means by which it can be controlled is by preventive measures. On farms where an outbreak has occurred, al lthe turkeys which have not come down with the disease should be marketed for meat and not sold for breeding. Nor should eggs from an infected flock be used for hatching. It would be well not to attempt to restock a farm with turkeys for several months; and not until a thorough disinfection of the premises has been made, by exposing the grounds to the hot summer sun and by the liberal use of freshly slaked lime in the poultry houses, roosting places, and feeding pens. A three per cent solution of liquor cresolis compositus should be used to spray the walls and all woodwork f the poultry house, including the roosts.

A fresh start may be made by hatching turkey eggs under hens, or by obtaining turkey eggs f,iffi e obtaining fresh breeding stock from a non-infected district. It is recommended that turkey raising be conducted on dry, sandy, well-drained lands, since black head seems to be prevented in large part by dryness of the surroundings.

Farmers' Bulletin 801, recently issued by the Department of Agriculture, Washington, D. C., recommends the use of sodium fluoride for the treatment of chicken lice. When used in powder form, it is sprinkled into the feathers, about the fluff, underneath the wings, on the neck, and on the under parts of the body. It may also be used as a dip; 1 ounce of the commercial powder is dissolved in 1 gallon of water. The entire body of the fowl, excepting the head, is immersed in this solution. One pound will treat 100 fowls, its cost being 40 to 50 cents a pound. Heretofore sodium fluoride has been used effectively in eradicating cock-roaches, and it was only recently accepted as good treatment for the eradication ot fhe chicken louse. It is said to kill any of the seven species of lice which infest chickens.

Feeding Dairy Cows for Maintenance and Feed Production

At this season of the year many cows in the herds of our most progressive Maritime dairymen, are coming to their lactation period. The succulent pastures and after math have put them in good shape during the weeks since they were dried off, to go forward to do their best in the dairy, providing they are given the care and feed that they deserve, and that the high prices current for dairy produce warrant.

The cows that have been milking for some time, and the heifers and cows due to freshen at later periods, must also be cared for and fed properly to get the former to continue to do their best an dto prepare the latter class for a profitable season's work.

A dairy cow requires food mainly for two purposes:

1. Maintenance.
2. Milk Production.

Under normal conditions, a cow in milk, first takes from her ration a sufficient amount of food for maintenance, and the remainder of the ration is available for milk production.

The amount of food required for maintenance varies with the size of the cow, but is practically the same whether she is dry or is in full flow of milk, while the amount required for milk production varies of course, with the amount of milk she is producing.

A medium-producing cow uses about 50 per cent. of her entire ration for maintenance. The proportion of the ration used for this purpose varies widely, depending upon the quantity consumed. The larger the ration that is used for maintenance, and therefore the greater the per cent. that is available for milk production.

Since a larger percentage of her entire ration is available for milk production, it is evident that a high producer is more economical than a low producer.

Cows that are producing heavily are most likely to be underfed. A heavy producing cow requires a large amount of food to restore the nutrients that she has already supplied for a large amount of milk. If she is to continue to produce at her full capacity, she must be supplied regularly with food sufficient (above maintenance) to restore the nutrients contained in her daily milk flow. If the proper food is not supplied in sufficient quantity, the milk flow will be reduced until the nutrients in the milk correspond to the nutrients that remain after full maintenance is taken away.

This was illustrated by Professor C. H. Eckles in "Dairy Cattle and Milk Production" as follows:—

"When the ration was reduced one-fourth, the amount of food available for milk production is reduced one half, or nearly so, since the reduction in no way affects the maintenance requirement. That is assuming that on a full ration, a cow is producing 40 pounds of milk a day, when the ration is cut down one-fourth, enough food remains above maintenance for only about 20 pounds of milk, and a cow must soon reduce her flow to that amount. Since, after maintenance has been provided, the remainder of the ration is used exclusively for milk production, it is a great mistake from the standpoint of economy to fail to supply to a high-producing cow a ration sufficient to allow her to continue to produce at or near her full capacity.

"On the other hand, a low-producing cow may be fed so much that she will be getting more food than she is capable of utilizing for milk production. Such a cow, after producing as much milk as she is capable of producing, will use the remainder of the ration to store fat in her body.

In an economical ration for such a cow, she is getting a ration that is large enough to meet her requirements. She has no surplus feed to convert into body fat. She will probably produce as much milk on the latter ration as on the former. Hence a list of general rules for feeding cows, usually includes this one: "If cows begin to gain in weight, reduce the ration."

By way of explanation, it should be said that no practical system of feeding can be empolyed by which a cow may be given at all times from day to day exactly the proper amount of feed; neither is it always desirable to do so, for reasons that will be discussed later. However, her requirements should be met as nearly as possible at all times.

As already explained, a cow that is fed above her requirements for maintenance and milk production, may use this surplus feed to convert into reserve material and may store it in the form of body fat. On the other hand, a cow that is not fed enough above maintenance to supply the nutrients for the milk that she is producing, may for a time draw on her reserve material to supply the nutrients lacking in the ration. In this case, the cow gradually loses flesh. She will, however, if the ration is not increased, finally reduce her milk flow until it corresponds to the amount of nutrients contained in her ration.

For several weeks after freshening, cows that are producing heavily, may continue to lose flesh because they are unable to consume enough feed to supply the nutrients for the milk that they are producing, and whatever amount of nutrients that is lacking in the ration is supplied from the reserve material that has been stored up in the body in the past. That is the milk-producing function is so strong in a highly developed dairy cow, that for a time after freshening, production takes precedence over maintenance, and even though the ration is insufficient, production continues and the cow loses weight. She should be fed a sufficient ration as soon as her appetite and digestive system wil lallow it.

It is evident that in preparation for freshening, it is neither a wasteful nor an undesirable practice, therefore to allow cows to gain weight near the end of the lactation period and while dry. Good returns will surely come from feed thus consumed by high-producing cows.

In discussing feeds, energy is expressed in terms of heat that is therms. A therm is equal to the amount of energy or power required to do work which, when converted into heat, will raise approximately 1,000 pounds of water 4 degrees Fahrenheit.

A dairy cow should have protein and energy producing foods mixed in proportion to meet her requirements. Such a mixture is referred to as a balanced ration. If the ration is lacking in either of the above classes of food, the other will not be used to the best advantage and may become waste. The quantity rather than the quality of the milk will be affected. The quality of the milk will not be changed but will remain normal. The cow does not have the ability to change the composition of her milk to correspond to the kind of ration she is receiving.

In case a ration contains more protein than is required, but is lacking in energy, the excess protein may to some extent take the place of energy-producing food, but energy-producing food cannot in any case take the place of protein in a ration, There is, therefore, less damage of feeding too much protein to a dairy cow than there is of feeding too little. For the sake of economy, however, the ration should contain as little as possible of excess protein, because protein feeds are usually more expensive than energy-producing feeds.

When not enough protein is supplied in the ration, the amount of milk produced must be adjusted to the amount of protein available for milk production. For instance, if a cow well along in her lactation period is giving 30 pounds of milk a day, and is changed to a ration that contains protein enough to produce only 20 pounds of milk, she will reduce her flow to that amount, even though the ration may still contain energy enough for 30 pounds of milk or more. The excess energy in such a case cannot be used to the best advantage, and is wasted so far as milk production is concerned.

The Illinois Experiment Station found that cows receiving a balanced ration, produced approximately one-third more than those receiving a ration considerably lacking in protein. Six and one half cows on the balanced ration produced as much as nine cows on the unbalanced ration.

Feeding Standards

The maintenance requirements for cows of different weights, and the production requirements for different qualities and quantities of milk are obtained from feeding standards that have been formulated on the basis of many feeding trials. The followings is taken from Armsby's Standard for

Maintenance Requirement

Weight of Cow Pounds	Digestible true Protein Pounds	Net energy Therms
900	.466	5.59
950	.483	5.80
1000	.500	6.00
1050	.517	6.20
1100	.533	6.39
1150	.548	6.58
1200	.565	6.78
1375	.618	7.42
1425	.633	7.60
1475	.648	7.78
1525	.662	7.95
1575	.677	8.12
1625	.691	8.29

The following standard for production is suggested by Eckles in Missouri Research Bulletin No. 7.

Requirements for Milk Production

Butterfat	Digestible proteins required per pound milk	Energy required per pound milk
Per cent.	Pounds.	Therms
3.00	.050	.26
3.50	.052	.28
4.00	.055	.30
4.50	.058	.33
5.00	.062	.36
5.50	.066	.40
6.00	.070	.45
6.50	.075	.50

ASSISTANT SUPERINTENDENT OF DAIRYING FOR NEW BRUNSWICK APPOINTED

Mr. Ben Gallant, a maritime graduate of the Guelph dairy school, was engaged to be assistant to the late Mr. MacDougall. His term of office was to commence about October 15th, and is now assisting in the campaign being carried on around Moncton for the organization of a co-operative creamery.

Mr. Gallant has been during the past two seasons managing a large co-operative creamery on P. E. Island and has also carried on considerable extension work for the P. E. Island department. He comes particularly well equipped to grapple with our dairy problems because, of his farm experience, his factory experience and his training at Guelph. He also speaks English and French fluently, which is a decided advantage in this province.

A Forward Move in Dairying

The New Brunswick Department of Agriculture, in response to representations from progressive farmers in the counties of Westmorland, Albert and Kent, is conducting a campaign in the above mentioncd counties, to interest farmers in a proposed cream gathered creamery at Moncton.

The proposal issued reads as follows:

Proposal for a Cream Gathered Creamery

"Realizing that dairying offers good inducements to the farmer who goes into it in a business-like manner, with a determination to improve and build up a good dairy herd, by weeding out unprofitable cows and by more careful breeding and better feeding, and knowing that it will ensure a profitable monetary return upon the invested capital and labor, and at the same time conserve and build up the fertility of the farm better than any other system of farming, and also in view of the fact that the home dairy does not offer the same stimulus to the business as the manufacturing of the products co-operatively through the medium of a cream gathering creamery, the Department of Agriculture called a meeting of the representatives from Westmorland, Albert and Kent Counties to consider the advisability of starting a cream gathering creamery in Moncton to serve the sections in those three counties that are not now patronizing a cooperative cheese factory or creamery.

"Representatives from the Federal and Provincial Dairy Divisions attending the meeting, and, after the cooperative cream gathering system had been explained and discussed, it was unanimously decided that it would be in the best interests of the farmers in those three counties to organize and operate a central creamery in Moncton.

The Proposition

"Arrangements can be made to equip an up-to-date creamery ready for operation in the business section of Moncton at a cost of about eight thousand dollars ($8000). Therefore it is proposed to organize a Joint Stock Company, Limited, to the amount of stock subscribed, with an authorized capital of twenty-five thousand dollars ($25,000), divided into one thousand (1000) share of twenty-five dollars ($25.00) each, and at present offer for sale three hundred and twenty shares (320), with a limit of twenty (20) shares to any one person; these shares to be payable as follows:

"Twenty-five per cent. (25 p. c.) at time of incorporation of the company; twenty-five per cent. (25 p. c.) yearly from that date until paid up; the company to be managed by and for the farmers according to a set of by-laws that will be submitted to the shareholders and will have to be approved by them before the business can commence, and all matters pertaining thereto will be thoroughly discussed at a meeting of the shareholders.

Assistance from the Department of Agriculture

"Interest upon the paid up capital at the rate of six per cent. per annum will be guaranteed by the Provincial Department of Agriculture until the business grows sufficiently to meet all legitimate operating charges and interest upon the paid up capital at the aforementioned rate, but this guarantee will not extend for a longer period than five years fro mdate of incorporation.

Results in Other Places

"The largest and most successful creameries in Canada are those operated on the cream gathering system, because an extensive territory is served, a large output is ensured and the operating expenses are correspondingly low, thus giving the farmer a better returne from his cream.

"The following figures, taken from the annual statements of the Scotsburn Creamery Company at Scotsburn, Pictou County, N. S., serving the territory from Pictou to Oxford Junction, will show the development that has taken place and the money paid fr cream in the last twelve years:

Statement Scotsburn Creamery, Pictou County, N. S.

Year	No Patrons	Lbs. Butter Fat	Net Value per lb. to Patrons	Cash to Patrons	Deficit	Surplus
1905 ..	26	11,142	21.42 cts	$2,153.20	$768.06	$.....
1906...	32	13.307	21.73 "	2,066.71	594.77	.....
1907...	35	10.054	22.31 "	1.943.04	538.75	.....
1908...	38	16,122	24.22 "	3.400.51	213.36	.....
*1909..	81	34,325	24.19 "	6.801.18	28.67	.....
1910...	204	107,715	24.40 "	22.146.04	.....	917.53
1911...	380	170.847	25.85 "	36,181.99		
1912...	423	181,614	30.14 "	44.788.08		
1913...	450	229.574	27.97 "	55,305.06		
1914...	502	277.672	28.07 "	65,678.48		
1915...	538	293.552	30.00 "	76,520.54		
1916...	592	327,715	34.25 "	97,077.06		

"This creamery was built by the Scotsburn Creamery Company and operated by the Dairy Division, Ottawa, until 1911, when the management was taken over by the Creamery Company. It was operated as a whole milk creamery until 1908, when the cream gathering system was adopted, and in 1909 the first cream was shipped in by rail.

"There has been a substantial surplus each year since 1910, after paying operating expenses, interest on capital and for improvements upon the plant each year.

Moncton as a Centre

With the railway connections centering in Moncton, practically every point in the three counties can be served and dairy experts familiar with the outlying districts agree that a better centre for a business of this kind cannot be found in the Maritime Provinces; and again, the retail trade for high-grade fresh made creamery butter and butter-milk in a town the size of Moncton is an advantage that many of the successful creameries now in operation do not enjoy."

A series of meetings have been arranged by Mr. J. H. King, the new District Representative for Agriculture, for the three counties, commencing on October 15th and continuing thereofter until early in November. The Department of Agriculture has furnished men in twos to address meetings in the various agricultural centrs, and bring the proposition to the attention of the farmers.

The speakers are as follows:—

W. R. Reek, Deputy Minister for Agriculture; J. H. King, District Representative; Rev. P. C. Gauthier, the father of co-operation in Prince Edward Island; Benj. Gallant, one of Prince Edward Island's foremost butte rmaking experts, who has just recently joined the staff of the New Brunswick Department of Agriculture; Harvey Mitchell of the Dairy Division, Ottawa, one of the foremost authorities on dairying in Canada; David W. Murray, President of the Scotsburn Creamery Company, the company that put Scotsburn on the map as a butter making community; W. A. McKay, Dairy Superintendent for Nova Scotia; A. J. Gaudet, of the Cow Testing Association, Ottawa, and M. A. MacLeod, Superintendent of Agricultural Societies in New Brunswick.

The attendance at the meetings has census of opinion expressed by the most progressive farmers in each locality is that it is a move in the right direction.

An option has been taken of a building on the Main Street in Moncton. The building in question may be purchased or rented at reasonable figures. Offices in the building may be been very encouraging, and the conrented for a sufficient amount to cover the interest in the investment, providing the building is purchased, or pay the rent if taken on a rental basis.

The retail butter trade and the sale of the by-product, buttermilk, will bring the producer nearer the consumer and will give the producer the best possible price for his cream.

Several business men in Moncton would gladly take all the shares of stock that are being put on the market, but the cream producers will be given the first opportunity to subscribe, and thus make it a co-operative, centralized creamery, managed by the farmers themselves, with the assistance of the best buttermaker available and the Department of Agriculture's dairy experts.

Butter will be manufactured for a certain rate per pound, which rate will cover, the butter-maker's salary, salt, parchment, boxing, freight on cream from point of shipment, interest on investment and other incidental expense.

This is the plan followed at the successful Scotsburn Creamery, and the figures in the preceding table will show the reader the net return per pound for butter-fat, after three cents per pound for butter manufactured had been deducted.

Scotsburn started operations as a sorry showing until they changed over whole-milk creamery and made a sorry showing until they changed over to a cream gathered creamery, when a new era dawned on Scotsburn. Dissatisfied patrons became satisfied patrons. The amount of money paid to patrons increased by leaps and bounds until this year they will pay in the vicinity of $130,000 to men who have pinned their faith for a bigger and better Scotsburn and the dairy cow.

Farmers living in the remote corners of the three counties, wil lhave the same advantages as the farmers living near Moncton. They will all receive the same amount per pound for their butter fat. Farmers living at some distance from railway stations may well club together and take turns at delivering the cream to the station. The more they co-operate the better will they be satisfied.

Westmorland, Albert and Kent counties have possibilities that when properly developed along dairy lines, will help to increase the revenue of the farmers and help estabish a reputation for New Brunswick as a butter producing community.

Committees are now at work in the various centres where meetings were held, to get a census of the cow-population and other information that wil lbe of use for organization purposes.

Mr. J. H. King will call two delegates from the various districts, to meet at Moncton early in November, when organization will be proceeded with and matters arranged for getting things in order for an early start next spring.

Eradicating Tuberculosis in Cattle

1. You must be honest with yourself. That is, take it for granted that there are some animals in your herd that have tuberculosis; that you desire to know which ones they are; that you will not sell them except as tubercular; that you want to protect your animals from the spread of the disease; that you want to raise a healthy young herd; and, finally, that you want to do everything you can to accomplish these ends. As the old saying goes, "he who fools himself is a fool."

2. The infectious disease known as tuberculosis is a subject with which both the Federal and State governments have struggled for the past period of years in their efforts to eradicate it. Very little substantial headway has been made.

3. The plan which we recommend, we have named the "Fred F. Field Method of Eradicating Tuberculosis," because it has been successfully carried out at Dutchland Farms by the Fred F. Field Holstein Company during the past three and one-half years, and is still working out successfully. Its practical working has been demonstrated. It is based on sound scientific and common sense theories.

4. First is cleanliness. Keep the cobwebs swept from your stables and have them properly white-washed as often as necessary to keep clean.

5. Get all the sunlight into your stables that is possible. It is absolutely impossible to get too much.

6. Have plenty of fresh air in your barn. You may decide the way to get the fresh air. Modern ventilating systems readily accomplish this result, but if you don't desire and cannot afford to use them, very simple means will accomplish perfect ventilation or a continuous supply of fresh air. As long as there is plenty of it and it is fresh, that is all that is necessary. Fresh air is very essential, as it is very important that, as far as is practicable, every breath the animal takes should be new air going into her system and not foul air of any sort.

7. In other words, treat the animals as human beings are treated for tuberculosis—that is known as the "fresh air" treatment.

8. Treat the mangers, stanchions, feeding boxes and floors with disinfectant solution. There are several kinds used that are inexpensive, but the stable fittings and floors must be washed and kept clean and well saturated with germ killer as often as necessary to keep them clean, at least once a week. The modern stable fittings are more easily cleansed, but they are not necessary or essential in the work. Wood floors and fittings can be made clean and disinfected. Manure should be promptly removed from stables to eliminate any possible danger from this source.

9. Now we have our barn ready to house the cattle, let's start in to treat the cattle and their offspring.

10. Assume, if you please, that every breeding cow that you own is tubercular. Now that is solely for your own protection. The animal may be perfectly healthy, but you are taking no chances. Later on we make recommendations about the treatment of these breeding animals.

11. As soon as the cow drops her calf, the calf should be taken away immediately, never allowing the mother to even' smell of it, to say

nothing about suckling it, as the calf never should be allowed to have any of its mother's raw milk. If you haven't a calf barn, this calf should be taken away so that it will not come in contact with any of the other animals, old or young, that are reactors or which you have assumed to be reactors.

12. Purchase a "pasteurizer" which has the "holding" process, which is equipped with a reliable thermometer; that is to say, it heats the milk to 145 degrees and holds it there thirty minutes.

13. Feed your calf on this pasteurized milk from the start. Feed no other. This milk should invariably be fed at blood heat or the same temperature as milk freshly frawn from the cow. The percentage of loss of calves at Dutchland Farms for the past three and one-half years has been less under this system of feeding than when we were feeding raw milk or allowing them to suckle their dams.

14. Never allow these calves, from the time they are born, to mingle with any reacting animals, or any cattle, old or young, which you have assumed to be reactors. As they get older, never allow them to drink water from the same trough or the same bucket that has been used for that purpose by the cattle assumed to be reactors. Water is a carrier of tuberculosis germs.

15. When they are old enough to turn to pasture, have a double line of fence, ten to fifteen feet apart, between your reacting animals or the assumed to be tubercular ones, so that your reacting animals and your clean ones cannot get their noses togetrer or in any way come in contact with each other, for such practice is certain to result in infection.

16. You are now raising up a clean herd of animals, if this system has been carried out, among which you will have practically no reactors. It is possible that you might have one occasionally, but in the great number which have been tested at Dutchland Farms in the three and a half years under this system, there have been only three reactors in the young animals that were brought up under this system. Application of the tuberculin test at this period (say as yearlings) will determine the progress made in "cleaning up." Employ only a veterinarian of known integrity and skill; such a man will use only a standard preparation of tuberculin. The services of such a man cost no more than those of an ordinary one.

17. The thing of vital importance to do with your breeding animals is to have samples taken of the sputum or secretions of the lungs and throat for the purpose of bacteriological testing. A skilled veterinarian can get these samples from a cow's throat by the use of the sputum cup. Such a skilled veterinarian will have such necessary instruments and laboratory connections as will enable him to efficiently do this work. If your local veterinarian is not experienced in this work, we will furnish the name of a competent man. The object of this sputum test is to determine whether the cow is passing off from the nose or throat the infectious tubercle bacilli which spread the disease. If the results of the sputum culture show the presence of the disease germs, it means that the animal is a "spreader." It is well to have your breeding cows tested at least once, by a competent veterinarian, with the tuberculin test; if reactions result, it does not follow that all reactors will by any means be "spreaders." Under this method unless a reactor proves to be a "spreader," she is not at any time any source o fdanger, although she may at any time become so; but applying the sputum test will protect you. The use of the pasteurized milk for the calves eliminates the possibility of infection from this source; the sputum test has determined whether or not the cow is a "spreader." If a "spreader" has been found, she should be removed from the herd. If valuable for breeding purposes, she should be isolated completely. If not valuable, destroy her.

Under the Field method pasteurization differs from the ordinary understanding of the term. Under this method the milk is heated to 145 degrees Fahrenheit (a thermometer must be used) and held there for a period of thirty minutes. There must be no variation from this method. So-called pasteurizing the milk by scalding is dangerous and will certainly result in the death of the calves. No variation from the method indicated is permissible.

18. By this method you are making the milk of the animals in your breeding herd safe, that is, by the "holding" pasteurizing process, whether the animals are actually reactors or only assumed to be for the purpose of carrying out this method. Now don't get confused by the word "pasteurization" and think it means a lot of complicated machinery. It does not. It is derived from a great French scientist named PASTEUR who discovered that some disease germs were killed by heat at a lower temperature than boiling. Boiling sterilizes. A lower temperature kills the bad germs without changing the physical character of the milk and it does not kill the good germs which are necessary to the life and health of the animal. If the purchase of a standard pasteurizer cannot be afforded, it is still possible to exercise this method by the use of ordinary home utensils, but in this event, the greatest care must be exercised to keep the milk stirred continuously during the process and the thermometer constantly consutled to see that the milk is held at 145 degrees for thirty minutes. The use of a standard pasteurizer is recommended in all cases, for by the use of kitchen methods, simply, the liability of failure in properly pasteurizing the milk is too dangerous a risk to be assumed except by the most careful people.

19. Now by carrying out this method, in a few years you will come to realize that you have turned what liiked like a serious loss to you into a profit. In other words you have grown up a new, healthy herd, while at the same time you have preserved your tubercular breeding herd without any material loss, which herd can be maintained until age and condition indicate the time for their disposal.

20. Calves' navels should be kept disinfected until they are practically dried up. Calves' feeding pails and buckets should be kept clean and scalded. Have plenty of sunlight and fresh air where the calves are kept. Calves' bedding should be dried and not left wet for the calves to lie down in. In other words, treat them humanely, as you would your own babies.

"It's a common sense method—keep everlastingly at it."—Holstein Friesian Assn. of America.

Chop Feeds

The term "chop" or "chop feeds" is a general one used to denote a class of feeds which are essentially oat products. Mill feed, cattle feed, oat feed, moulee chop are common names for these feeds used by the local grist mill, while some of the larger mills put out this product in quantities under specific brand names. Certain of these feeds consist entirely of crushed or ground oats, others consist almost entirely of the by-products of the oat meal mill (including oat hulls) while others contain a certain admixture of corn, barley, etc. They are extremely variable in composition. The Commercial Feeding Stuffs Act, under the administration of the Department of Inland Revenue contained many complaints regarding these chop feeds. In certain cases it was stated the feed was refused by all classes of stock and only eaten with repugnance after being mixed with bran or middling. In any other cases, persistency in feeding the material resulted in the death of swine, calves and poultry, apparently partly from starvation and partly from digestive disorders brought on by the low nutritive value of the feed and its coarse, fibrous nature.

We obtained a few samples of these feeds respecting which complaints had been made, collecting them in Ontario, Quebec and British Columbia, and submitted them to analysis, with the following results.

Analysis of Chop Feeds.

No.	Water	Protein	Fat	Carbohydrates	Fibre	Ash
1.	8.74	4.77	1.87	50.97	28.01	5.64
2.	9.83	9.69	2.54	63.93	10.70	3.31
3.	8.40	9.95	1.59	64.64	12.00	3.42
4.	7.08	8.85	2.56	61.19	12.50	7.82
5.	6.65	6.58	1.74	55.46	24.42	5.15
6.	5.73	6.80	2.28	57.67	22.07	5.45
7.	11.33	8.14	2.13	66.85	8.68	2.87

does not require any registration of chop feeds nor any guaranty as to their percentages of protein, fat and fibre. However, the "Adulteration Act" has established a standard of quality for certain grain products and it states that "Chop Feed is whole grain of one or more kinds more or less finely ground, and contains not less than ten (10) per cent protein, not less than two (2) per cent of fat and not more than ten (10) per cent of crude fibre." All chop feeds not carrying a guaranty as to nutritive value (minimum percentages or protein and fat and maximum percentages of fibre) ought to conform to this established standard or be considered adulterated.

The correspondenc of the Division of Chemistry during the past year has

While we do not claim that these analyses are typical of chop feeds as sold generally throughout the Dominion, it is highly significant that not one of the seven samples examined containet the minimum percentage of protein required by the standard, that they are all exceedingly low in fat and that they with one exception contain an excess of fibre—three of them over 20 per ient. Taken as a series they are of extremelf low feeding value and several of them, notably Nos. 1, 5 and 6 are praitically worthless.

These feeds ranged in price from $20 to $35 per ton. In a few of them there was a sprinkling of corn, but in the majority of them the proportion of meal was very small; they were all

(Continued on page 90)

Results With Root Seed Growing in Canada

Among the problems that the great war has created for Canada, the problem of growing root seed, i. e., seed of swede and fall turnips, mangels, and field carrots, may seem rather insignificant to the average Canadian citizen. Yet, that problem is to-day one of the most vital to the Canadian farmer, notably the dairy farmer, inasmuch as it is directly connected with the providing of that indispensable stock food that is generally referred to as "roots."

In 1915, Canada imported a total of 1,927,313 pounds of turnip seed, and 1,056,060 pounds of mangel and beet seed. In 1916, the import of turnip seed dwindled to 150,855 pounds and the import of mangel and beet seed to 636, 797 pounds; and for 1917, the figures stand at 291,379 pounds for turnip seed and 891,677 pounds for mangel and beet seed. This means that Canada imported a total of these most important farm seeds, in the years of 1916 and 1917, which falls short of the import of 1915 along oe, roughly, one million pounds. It should be added that practically every pound of field root seed used in this country is of European origin.

That Canada was running a great risk of having her supply of root seed from Europe shut off, partly or wholly, as a result of the war was regretfully predicted in an Experimental Farms bulletin entitled "Growing Field Roots, Vegetable and Flower Seeds in Canada", issued early in 1915. In the said bulletin, an appeal was made—as has also repeatedly been done later in many issues of "Seasonable Hints" distributed by the Dominion Experimental Farms System—to Canadian farmers and others interested in the seed supply being kept up, urging that Canada could not afford to take the risk of relying on import from Europe either under prevailing war conditions, or immediately after the conclusion of peace. It was emphatically stated that **"Canada should make herself independent of foreign markets and produce at home what now has to be bought from abroad.** Canadian farmers should not only try to meet the emergency demand for field root seed in the immediate future, but also try to establish a permanent seed-growing industry which would make them independent of any other country." The bulletin went further and predicted "that many districts of Canada where root seed growing is unknown at present, will prove themselves not only able to produce seed of good quality, but also to be especially well adapted to seed raising."

To what extent this prediction was justified, will be shown by the data following, showing what results in root seed raising were obtained in the year of 1915. In that year the Central Experimental Farm at Ottawa raised, from a field about 1½ acres a first class mangel seed crop at the rate of about 1,150 pounds of seed to the acre. Mangel seed was produced at the Experimental Farm at Agassiz, B. C., at the rate of 2,100 pounds per acre, at the Experimental Station at Lennoxville, Que., at the rate of 1,150 pounds per acre and at the Experimental Station at Kentville, N. S., at the rate of 2,100 pounds per acre. The same year the Experimental Station at Lennoxville, Que., raised swede turnip seed at the rate of close to 1,250 pounds to the acre.

But what about the profit? Does it pay the grower to raise that kind of crop? As an answer, it may be stated that there was, according to records kept, a net profit of about $80 per acre from the mangel seed crop at the Central Experimental Farm, Ottawa, in 1915. And this in spite of the fact that the men handling the crop were quite unfamiliar with the same.

The above figures indicate, most decidedly, that there are, in Canada, great opportunities for developing a new field in agricultural activity promising substantial rewards, from a profit standpoint, to those who take up root seed growing conscientiously and in a business-like manner.

May it also be added that the raising, in Canada, of the seed needed in the country will directly help to increase the average yield of the root crops of the Dominion. This will, however, be discussed in a special article.

WHO IS RESPONSIBLE?

Dr. G. M. Mitchell, writing in a recent issue of The Maine Farmer says:—

A young man came to the writer a few days ago with the statement that he had been on his farm five years and, with a young family, was trying to get a living. He said that until this year he had gained a little and then came this significant statement: "Doctor, if it hadn't been for my cows, I should have gone bankrupt this year. The government came after us all last spring to plant all we could, and I felt it my duty to respond and did my best. You know the floods came and washed my fields, cold weather retarded growth, and the early frost killed the sweet corn, beans and all my vegetables, and the potatoes rotted before I got them dug. I hope my cows will save me, provided the same government does not step in and prevent us from getting a fair price for milk."

Here is the story coming from many sources, but in none more touching than from this young man who with wife and four children owing his farm five years ago, is now conscious of the injury produced by seeking to answer the call of the officials at Washington and in Maine. He knows that all the time he has been seeing his crops go out from under him, from no fault of his, every ship builder, every steel manufacturer, every woolen mill doing government work, every munition factory, and so on to the end of the chapter, has been guaranteed cost and a big profit. Not content with this, if there are labor troubles, the same government steps in to smooth out matters by paying more. Dollars for every other manufacturer, but not one cent for the man struggling to save his farm and grow all he can to help feed others. The day of reckoning is certain to come, for this short-sighted policy is sure to bear fruit and the rank injustice bring a righteous verdict. That injustice rests on the full recognition of all other classes and industries and total disregard of the men on the farm, except to spend millions to support an army going about to instruct them how to grow more, that they may sell for less. Is it any wonder men are leaving the farm to seek employment in other industries?

When the draft was announced, it was stated that the farm and farm labor would be exempt, but, instead, the most strenuous appeals for alolwing necessary help to remain until crops are harvested are refused. Here is the situation facing the farmers of the east, and it is no wonder there is unrest on every hand. When another spring comes round and the attempt is made to get farmers to plant more, we shall meet a different condition than last May and June. The farmers next year will look out for their own interests first, last and all the time, and let the other fellow do the same. All this friction might have been prevented had those in authority played fair with the farmers and treated them as all other industries were treated.

No man has heard anything about special favors, but the claim all along has been for simple justice. That being refused, is it any wonder that growers propose hereafter to go it alone and look after their own interests, plant what they please, when they please, and as they please? When men honestly seeking to answer the urgent appeal of officials, later face bankruptcy from no fault of theirs, and know all the time that every other class is protected, one is surprised at the coolness manifested. So far as known, nothing is being done by any of our chosen representatives at Washington to relieve the situation. Those who have so patiently striven to uphold and strengthen all agricultural efforts and make more secure the character and quality of life on New England farms, view the situation with alarm.

When the farmer of today has met all the opposition others must overcome, he still has the great forces of nature, the elements of drouth, flood, tempest and cold, as well as a myriad army of pests, the ilke of which has never been met before. If this nation is to be saved, it must produce the food of support for its millions, and no problem before the government is so vital today as the upbuilding of a live agricultural sentiment. Give the farmers an incentive in the form of such protection as is granted all others, and there will be no necessity for special instruction—for every man will do his best. Continue to withhold that protection and the injustice will do more to destroy than all else combined. Put responsibility where it belongs and stand to defend our position.

Dr. Mitchell instances cases in the foregoing paragraphs that are not altogether unfamiliar in Canada. Many of the farms of the Mritime Provinces are depleted of their young manhood and unless exemption from military service is asked for the young men who are too proud to ask for themselves, production in these provinces will surely suffer.

THE ONE SOW

In innumerable instances, one sow can be handled to advantage and an economic production of pork brought about, where five sows would mean production of pork at a loss. The one sow would largely mean utilization of what is now waste; five sws the purchase of high-priced feed for turning progeny into pork, with the result of high cost of production. The one-sow man is the farmer who can come to the rescue of the nation in this emergency. Make it possible by furnishing the necessary credit at a lo wcost. The same principle applies to both sheep and cattle. It is the man who will produce in small units whom we must rely upon to get our increased supply of live stock.

PROFITABLE PARTNERSHIP

If your farm work is getting too heavy for one pair of shoulders, why not take the son into the partnership? Many farmers have already tried the plan f including the boys and girls in the corporation that is running the old farm, yet a few have dreaded to "let go" a part of the responsibility and a part of the benefits coming from the farming operations. It has proven the very best method of keeping the boys and girls engaged in agricultural pursuits—it has made them love their work.

* * *

Every breeder of cattle will do well to read and carefully study the article on another page of this issue, entitled The Eradication of Tuberculosis in Cattle. This is the substance of an address by Fred F. Field, before the Holstein Friesian Association of America, held last summer at Worcester, Mass.

A committee was appointed to have the remarks compiled and printed for the benefit of breeders generally.

Any information that will tend to help the breeder in eradicating this bane of cattle raising should be of very great interest. Inasmuch as Mr. Field's remarks are based upon his actual experience, and his method of eradicating this dread disease, is therefore soundly practicable instead of being merely theoretical, we believe that cattle breeders genrally will be interested in knowing just how his plan works.

* * *

After considerable negotiation and discussion between the Department of Agriculture and the Canadian Railways appointed a small representative committee to confer with the Minister in the matter of the continuance of the half rate privilege of L. C. L. shipments of pure bred stock in Eastern Canada. At a conference between the Minister and the members of this committee, which was held in Mr. Burrell's office recently, the committee, on behalf of the Railways, agreed to continue the half rate privilege, it being provided, however, that the minimum charge for any single shipment wil lbe $4.00, unless the full tariff rate makes a lower charge in which case the latter will apply.

* * *

Farmers, conserve the scrap iron of worn-out machinery! Set the boys to gathering it up and placing it where it will not deteriorate with rust, for it will all be required before the much hoped for peace has been signed. By collecting and selling now while prices are high, you will not only favor yourself, but your country, which needs this metal right now. The farmers of a community can collect and co-operate in marketing this by-product, thereby saving much expense necessary when individual shipments are made. Bear this in mind, and do the collecting before snow comes to hide or frozen ground to hinder.

* * *

A mellow hide is the sign of profit in steer feeding.

* * *

The filling of the silo may be done most cheaply by co-operative ownership of machinery and by the old-fashioned plan of "changing works."

PRIZE WINNERS AT YARMOUTH EXHIBITION

HORSES

Standard Bred

Mare, 4 years old and upwards—1, Kenneth Morton.

Hackney Horses

Filly, 3 years old—1, Chas. L. Cann.

Clydesdale Horses

Mare, 4 years old and upwards—1, H. P. Milestone.

Filly, 1 year old—1, Murray Crosby.

Mare, any age, diploma—H. P. Milestone.

Roadsters

Mare or gelding, 4 years and upwards—1, S. F. Nickerson; 2, Edw. Rose; 3, Alvin W. Robbins.

Filly or gelding, 3 years old—1, O. K. Milestone; 2, Mrs. T. B. Stubbard.

Filly or gelding, 2 years old—1, J. F. Fraughten; 2, Lloyd Cook; 3, S. F. Nickerson.

Filly or gelding, 1 year old—1, Windon Morton.

Foal of this year—1, Alice H. Churchill.

Brood mare with foal by her side—1. Alice H. Churchill.

Carriage

Mare or gelding, 4 years and up—1, Austin L. Robbins; 2, Wm. H. McConnell.

Filly or gelding, 3 years old—1, Wm. A. Killam; 2, Wentworth Hemeon.

Filly or gelding, 2 years old—1, Chas. Bell; 2, Jas. B. Allen.

Filly or gelding, 1 year old—1, Jas. B. Allen.

Foal of this year—1, W. Hemeon.

Brood mare with foal by side—1, W. Hemeon.

Matched pair—1, Geo. T. Bain.

Mare and 3 of her progeny, diploma—W. Hemeon.

Mare or gelding, any age, diploma—Alice H. Churchill.

General Purpose

Mare or gelding, 4 years and up—1, H. W. Corning; 2, Fred Pitman; 3, Harris Crowell.

Filly or gelding, 2 years old—1, Wm. H Palmer; 2, Cann Bros.; 3, Roy Cleveland.

Filly or gelding, 1 year old—1, Mrs. Edgar Cann.

Foal of this year—1, Edson Foote; 2, Vernon Cleveland.

Matched pair—1, Mrs. Clifford Cann.

Mare or gelding, any age, diploma—1, Wm. H. Palmer.

Light Draught

Mare or gelding, 4 years and up—1, Fred L. Rose; 2, Geo. W. Murphy; 3, Lloyd W. Cook.

Filly or gelding, 2 years old—1, Mrs. Clifford Cann; 2, Geo. W. Killam; 3, Mrs. Edw. Cann.

Filly or gelding, 1 year old—1, B. B. Killam; 2, Harold McConnell.

Foal of this year—1, B. B. Killam.

Brood mare with foal by side—1, B. B. Killam.

Matched pair—1, Chas. Butler.

Mare or gelding, any age, diploma—Mrs. Clifford Cann.

Heavy Draught

Mare or gelding, 4 years and up—1, Benj. Bain; 2, Vernon Allen; 3, A. Corning.

Filly or gelding, 3 years old, over 1200 lbs.—1, Wm. A. Churchill.

Filly or gelding, 2 years old, over 1000 lbs.—1, Hartley Pitman; 2, A. Corning; 3, Fred L. Rose.

Filly or gelding 1 year old—1, Rupert Pitman; 2, Edmund Dennis.

Foal of this year—1, B. B. Killam.

Brood mare with foal by side—1, B. B. Killam.

Matched pair—1 Hugh Cook.

Mare or gelding, any age, diploma—Benj. Bain.

Special Prizes

Roadster, 4 years old and up, in gear—1, S. F. Nickerson; 2, Edw. Rose; 3, Alice H. Churchill.

Carriage horse, 4 years and up, in gear—1, Geo. T. Bain; 2, Miss Clara Caie; 3, Austin L. Robbins.

CATTLE

Shorthorns (reg.)

Bull, 2 years old—1, Dr. I. M. Lovitt.

Cow, 4 years old—1, 2, Dr. I. M. Lovitt.

Cow, 3 years old—1, 2, Dr. I. M. Lovitt.

Heifer in milk, 2 years—1, Dr. I. M. Lovitt.

Heifer, Sen. 18 mos. old and under 2 years—1, Dr. I. M. Lovitt.

Heifer calf, 6 mos. and over—1, Dr. I. M. Lovitt.

Heifer colf, 6 mos. and under—1, 2, Dr. I. M. Lovitt.

Bull and three of his get, diploma—Dr. I. M. Lovitt.

Grades

Heifer Sen., 18 mos. old and under 2 years—1, Wm. A. Pinkney.

Ayrshires (reg.)

Bull, 1 year old—1, Jas. B. Allen.

Heifer in milk, 2 years old—1, Jos. A. Ellis.

Grades

Cow, 4 years and up—1, Jos. A. Ellis; 2, Adolph. Corning; 3, Ira Moses.

Heifer, 2 years old, dry—1, Jos. A. Ellis.

Heifer, Sen., 18 mos. old and under 2 years—1, Jas. B. Allen.

Heifer, Jr., 1 yr. and under 18 mos.—1, Jas. B. Allen.

Heifer calf, 6 mos. and over—1, 2, Jas. B. Allen.

Jerseys (Reg.)

Bull, 3 yrs. and up—1, Cann Bros.; 2, John C. Corning; 3, W. L. Cook.

Bull, 2 years old—1, Benj. Bain.

Bull, 1 year old—1, H. P. Milestone; 2, Chas. L. Cann; 3, Cann Bros.

Bull calf, 6 mos. and over—1, I. M. Lovitt; 2, Cann Bros.; 3, Chas. M. Rogers.

Bull calf, 6 mos. and under—1, I. M. Lovitt; 2, 3, Cann Bros.

SUMMER PRUNING THE YOUNG APPLE ORCHARD

Shall we summer prune our apple orchards? The question of summer pruning is a perennial one, and one that is far from being settled as yet. The writer does not feel competent to express an opinion on the summer pruning of mature apple orchards, but with young trees there are many possibly to whom the results to date of the experimental pruning at the Vineland Station, may prove of interest and value.

The object of summer pruning is obviously to induce fruitfulness. Probably every fruit grower is familiar with the fact that fruit buds are formed the season previous to their expanding. It has been further determined that the fruit bud begins to differentiate from the leaf or branch bud early in July, the time, of course, varying with variety, weather conditions, etc. This also is about the time that wood growth slows up or stops on bearing trees, and naturally we associate these two facts together—that the energies of the tree are used up until that time in making the vegetative increase or growth, and afterward the energies go to the formation of fruit buds, and maturing the wood and fruit. The object of summer pruning, then, is to anticipate nature a little, and by the removal of unnecessary growth, and more particularly by the checking of terminal growth to divert more food into the formation of fruit buds than would ordinarily be the case. At the same time it is evident that summer pruning must be done late enough to avoid the stimulation of new growth. A large amount of wood should not be removed particularly if the pruning is done rather early, as such pruning will undoubtedly stimulate the development of secondary shoots, which may produce quite as much growth as the original shoot would have done. But if pruning is delayed until growth has practically ceased, and if it then consists mainly in taking out the growing tops of the leaders it ought to have a considerable influence towards fruit bearing. In other words, the part of the tree which was forming new leaves and new wood, and which was therefore using a large amount of plant food has been removed, and the tree can turn its whole energy into the development of strong fruit buds for next season's crop.

The apple orchard at the Experiment Station, in which the pruning work is being conducted, consists of 646 trees, including 170 trees of standard varieties: Hyslop, Spy, Greening, Baldwin, King, Hubbardston, Cranberry, Jonathan and McIntosh; and 476 trees of fillers, Dudley, Duchess, Wagener, Wealthy and Ontario. The orchard was planted in the spring of 1911 and the pruning experiment started in the spring of 1914. Three systems of pruning are being followed—winter pruning, summer pruning and little or no pruning.

Winter Pruning—These trees receive the usual treatment as practised in Ontario, being severely cut back and thinned out in March or April. The object is to form a framework that is pleasing to the eye, and at the same time will carry a maximum load of fruit without damage when the tree comes into bearing.

Summer Pruning—The trees are well thinned out in August and cut back only enough to keep the tree within bounds, which usually involves simply pinching out the terminal buds from the higher branches. The object is as much as possible to admit a maximum of sunlight, and air to develop as many fruit buds and the fruit spurs as possible, but at the same time not sacrifice the shape of the tree any more than is necessary. Early bearing is the object in view.

Little or No Pruning—These trees receive no pruning whatever except that a few cross and broken or otherwise injured limbs are removed. They are left as much alone as is conveniently possible.

Careful records are made of the size and vigor of the trees, blossoming dates, number of fruit spurs and fruit set, quantity of fruit harvested, and comparative size, color and keeping quality of the fruit.

RESULTS.

Table 1. Summary of Fruit produced 1916.

Method	No. of Trees	Total Weight of Fruit	Total Number of Fruits	Average Weight of Individual Fruits
Unpruned	207	3,260	14,416	.2261
Winter pruned	228	227	781	.2906
Summer pruned	209	1,820	7,169	.2538

As will be readily seen from a careful study of the above tables, the results to date are very uniform throughout. The summer pruned and unpruned trees were loaded with fine marketable fruit, both in 1915 and 1916, while the winter pruned trees, with the exception of two or three of the filler varieties, have borne practically no fruit. (In 1915, the winter pruned trees bore no fruit, the summer pruned trees 127.7 lbs., and the unpruned trees 209.4 lbs). There appears to be no doubt that summer pruning will bring the young orchard into profitable bearing much quicker than the plan usually followed of heading back severely each year. The unpruned trees, of course, have given similar results, but due to this lack of pruning the trees are not in as good condition for future bearing. They are more straggly, and have too many branches, thus not allowing of as free a circulation of air, or as much sunlight as is desirable for the control of insect pests and diseases and the production of the best quality of fruit.

Table II. Average diameter in inches of trunk of two standard and two filler varieties.

Variety.	Unpruned.	Winter Pruned	Summer Pruned
Wealthy...	2.267	1.967	2.130
Duchess...	2.093	1.703	1.942
Baldwin...	2.369	2.062	2.337
Greening...	2.489	2.052	2.393

The evidence presented in Table II is fully as marked as in the previous tabel, and is again strongly in favor of the Unpruned and Summer pruned trees. It is of interest also to note that the difference between Unpruned and Summer pruned is quite marked in the case of the earlier bearing, smaller growing varieties, Wealthy and Duchess, while in the case of the later bearing, larger growing varieties, Balding and Greenin, it is comparatively small.

The differences in the average diameters of the trunks in the three systems of pruning is, of course, correlated with differences in the general size and vigor of the trees. The Unpruned and Summer pruned trees are, in all cases, far larger than the Winter pruned trees.

It is possibly too early to draw any definite conclusions from the foregoing experiment as to the best time and method for pruning our young apple orchards, yet the results obtained are so striking as to merit more than ordinary attention and study. It should be noted that fourteen commercial varieties are included in the experiment, and the results to date have been in every case against out usual method of heavy winter pruning. (On account of space only four varieties are included in Table II). Little attempt is made in this article to account for the evidence obtained. It is simply given as it is and the reader left to draw his own conclusions.—By E. F. Palmer, Director, Horticultural Experiment Station.

PREVENT CAR SHORTAGE

All rail commodity tariffs effective September 1, 1917, provide for an increase in the carload minimum from 24,000 pounds to 30,000 pounds on apples. Class tariffs under which apples move from Nova Scotia points to points in Ontario and Quebec, remain unchanged, the minimum being 24,000 pounds.

There is a possibility that the increase on the western movement will centralize shipments in the larger centres and affect carload distribution throughout the smaller markets of Western Canada. Prevent this if you can by urging customers to continue to supply their local market with carload lots even under the increased minimum.

Te apple industry is called upon in this way to help conserve the car supply, but shippers must have the co-operation of the consignees. Many of the latter, even in large centres, insist upon a close adherence to minimum carload weights, the result being an economic waste which reduces the efficiency of the railways. Box packs will load quite easily in nearly all cars to the increased minimum, while in barrels the larger series of cars only can be loaded to and above the minimum.

Load and unload cars promptly.

Do not insist on having refrigerators if box cars will do.

Get shipments moving as early as possible.

To increase the average carloading of apples by one ton would be equivalent to placing 976 additional cars in service in Canada, and a car saved is a car gained.

Of course shippers cannot load more freight than is ordered, but as many cars will move to Ontario points from points in Nova Scotia under the 24,000 pounds minimum, we feel the shippers should exceed this minimum in every case, where possible under terms of sale, having due regard to the proper carriage of the fruit. If this is done the maximum use of every car is obtained, and it will go a long way towards solving transportation difficulties during the congested period.

G. E. McIntosh,
In Charge Fruit Transportation

BETTER APPLES

In packing apples, it is advisable to have them packed right so that when the purchaser of your apples opens the barrel or box, he will find them up to the standard of what they are marked. Satisfied customers are one of the best advertisements, as they buy more apples of the same brand, they tell their friends where they purchased the fruit, and advise them to buy from the same parties. The repeat orders are what count in business. It is much easier to sell to a satisfied customer than it is to have to hunt up new ones that are not familiar with the grade of your fruit.

We are situated near some of the best markets that use a large amount of apples. Let us awaken to the many splendid opportunities for orcharding that he have here in Maine, that

ought to be a good investment for the orchardist. Good care should be taken of the orchard. The trees should be cultivated, fertilized, pruned and sprayed. It has been my pleasure to visit quite a number of orchards that were receiving proper treatment, and the fruit looked fine.

Pruning to make an open headed tree is desirable, so that the sun and air can reach all parts of the top of the tree. Do not allow your fruit trees to overbear, as it may result in your fruit not growing to its normal size, but thin out, as the good-sized, highly-colored fruit brings the best prices.

If the trees are planted in rocky land, where it is impossible to plow, I would advise grubbing the land around the base of the trees and mulching. Where the tree is quite large, mulch for a good-sized space around the trunk.

The apple inspectors are now in the field, and the State Department of Agriculture is trying as far as possible to have a uniform pack, that will be acceptable to the trade and a credit to the state.—Maine Department of Agriculture, John A. Roberts, Commissioner, S. H. Eaton, Assistant Horticulturist.

FIGHTING APHIDS WITH FLIES

An interesting situation in international entomology has recently developed, with reference to the modern practice of introducing, from one country to another, an insect control of an insect pest. The spectacular success of the Australian lady-beetle against the fluted scale of citrus fruits in California; the slower, more complex but ecective work of imported parasitic and predaceous enemies against the browntail and gypsy moth in New England; and other experiments of this nature, varying in importance, are already matters of economic history.

Up to this time, few, if any, attempts have been made in this connection to distribute the syrphidae, a family of flies, (diptera), many of which are, in their larval stages, predaceous upon aphids. It has been well known, of course, that this habit is of real economic importance, but it has apparently been customary to relegate these flies to a position of second importance in this field of useful endeavor, and to confer first honors to the lady-beetles and parasitic hymenoptera.

Observations of some 10 or 12 years in Maine, however, indicated strongly that the syrphid larvae are, in that locality, the most efficient natural enemies of the aphids. In accordance, therefore, with the entomological policy of the Maine Agricultural Experiment Station to solicit the co-operation of specialists for problems of prime importance. Prof. C. L. Metcalf was invited to study the syrphidae of this state with particular reference to their larval habits.

Significant data were thus secured concerning which species of syrphids feed upon a given species of aphid. The publication, in bulletin form, of this and related information included the statement that a certain syrphid, pipiza pisticoides, plays in the vicinity of Orono a role of first importance as a natural enemy of the woolly aphid of the apple. The larvae feed so abundantly that the above ground colonies of this pest are well nigh exterminated by late summer.

Following upon this announcement a request came from Perth, Western Australia, for an importation of these flies in consideration of the fact that the woolly aphid is the most serious apple pest in that state. Accordingly, the Maine Agricultural Experiment Station has recently sent a shipment of pipiza pisticoides. Possibly other syrphids which accept the same diet may be sent later.

It is never safe to predict results in an experiment of this sort, but the indications are in favor of a successful outcome. In which case the exchange of international courtesies—apples in Australia for oranges in America through benefit by insects—is of scientific as well as agricultural interest.—Chas. D. Woods, Director Maine Experiment Station in Maine Farmer.

The Military *Service Act, 1917*

CANADA

DON'T DELAY !

Do It TO-DAY

THE MILITARY SERVICE ACT is passed; the Proclamation issued October 13th. It is now the bounden duty of every man in Class One to report for service or claim exemption. This includes all bachelors and widowers without children (not otherwise excepted) who were 20 years old on the 13th October, 1917, and whose 34th birthday did not occur before January 1st, 1917.

What To Do

Go to your Post Office and ask for the form for reporting for service or for claiming exemption The form contains clear instructions for filling in. Do this not later than NOVEMBER 10th.

Beware of the Last Minute Rush

With so many thousands of reports and claims to be dealt with, the rush of Class One Men will grow heavier day by day. You will waste less of your time and serve your own best interests if you avoid the inevitable rush on the last day.

The law is being enforced with the Government and the People firmly behind it. Obey the law. Do it today.

Issued by
The Military Service Council

SUPPOSED INJURY OF CROPS BY BEES

Beekeepers are often compelled to combat the idea that bees cause damage to fruit or other crops by sucking the nectar from the flower. This is not only untrue, but in many cases the bees are a great benefit in pollinating the flowers, making a good crop possible. A more frequent complaint is that bees puncture fruit and suck the juices. Bees never puncture sound fruit, but if the skin is broken by some other means bees will often suck the fruit dry. In doing it, however, they are sucking fruit which is already damaged. These and similar charges against the honey-bee are prompted by a lack of information concerning their activities. Bees may, of course, become a nuisance to others through their stinging propensities, but beekeepers should not be criticized for things which their bees do not do.

In most cases honey is produced as a by-product to general farming, and it is a good one. In addition to their worth as honey makers, bees are a valuable aid to the orchardist by aiding the setting of the fruit. To any of you who are beginners, I would say, go carefully, and do not expect to make a fortune in one year. Use the best strains of Italians; they are good workers, and easy to handle.—Wm. Couse, Streetsville, Ont.

DAIRYING.

A GREAT CANADIAN BRED AYRSHIRE

The first Ayrshire cow to claim a five years cumulative official test in the Canadian Record of Performance is "DAISY OF FERNDALE"—26735. Daisy is owned and was put through the test by W. C. Tully, Athelstan, Que., a young man that recently started in the Ayrshire business. Her tests have been made under ordinary conditions. She is a regular milking machine, and it is with difficulty that she is dried off each season,—in fact, for the past three years she has milked constantly. As a four year old she made her first record of 15,534 lbs. of milk and 590 lbs. of fat and still holds the record in that class. In the next lactation period of ten months she gave 14,530 lbs. milk and 521 lbs. fat. In her five years period she gave 71,247 lbs milk and 2725 lbs. fat. She is a large cow, of splendid Ayrshire type and excellent dairy form. Wm. Thompson of Athelstan, Que., was the breeder of Daisy. Her sire, "LORD RONALD OF FERNDALE"—26733, traces on the sires side to "COMRADE OF GARLAFF (Imp)—9183, by "BLOOD-FOR-EVER" of WYNHOLM and also to "NELLIE OSBORNE" (Imp)—5258, and to "LORD DUFFERIN"—1470 by Mars. His dam, "LADY MAUD OF MONTEITH"—7347, traces on the sires side to "CHIEFTAIN OF BARCHESKIE" (Imp)—5362, and directly to "NELLIE OSBORNE" (Imp) —5258, and on the dam's side to "LORD DUFFERIN"—1170. The dam of Daisy is also "LADY MAUD OF MONTEITH"—7347, the same dam as her sire. Thus there is strong line breeding, as three times she traces to "NELLIE OSBORNE" and twice to "LORD DUFFERIN" by Mars. All were strong strains which accounts for the persistent and heavy production of this cow.

AYRSHIRYES IN R. O. P.

From July 25th to Sept. 11th, inst. twenty Ayrshire cows and heifers registered in the Record of Performance test. Seven mature, one four-year old, five three-year-old and seven two-year-olds. There was nothing special in production. A good average was made in all the classes. "DAISY OF FERNDALE"—26735, owned by W. C. Tully, Athelstan, Que. head the list in the mature class with 11267 lbs. milk and 467 lbs. fat. Two others "SUNNYSIDE BLYTHE KATE"—36376, owned by Antoine Phaneuf, St. Antoine, Que., gave 10842 lbs. of milk and 415 lbs. fat and "LASSIE OF THE HIGHLAND"—21491, owned by W. C. Tully, gave 10,222 lbs. of milk and 429 lbs. fat. In the three-year-old class "AGGIE OF DARROCH"—44849, owned by Angus Armour, Dorchester, Ont. ,holds the highest record for milk with 9148 lbs. and 366 lbs. fat. "IDA OF THE GLEN"—39734, owned by Peter Vineau, Rollo Bay, P. E. I., gave 8266 lbs. milk but excelled "AGGIE" in fat with 383 lbs.

The highest in the two-year-old class was "APRIL BLOSSOM"—49757 owned by Robert H. Little, Campbellford, Ont., with 7619 lbs. milk and 306 lbs. fat.

The striking feature of this number was the high butter fat test, only three animals below 4% fat. Each animal in the test gave over 7000 lbs. milk but two and they being slightly under. Herein is where the Ayrshire cow excels, by giving a good flow of high testing milk.

W. F. STEPHEN, Sec.-Treas.

WAS IT THE COW'S FAULT?

Supposing that you keep a cow giving five thousand pounds of milk in a year, for which you receive seventy dollars cash, how much profit does that cow make? This is not a riddle, but simply a query that every dairyman should be in a position to answer. Leaving aside the "higher accounting" side of revenue and expenses per cow —those persistent items of rent, interest, taxes, depreciation, etc.—and taking only income from milk or fat, and cost of feed, are you then in a position to say definitely that each cow you keep does make a good clear profit above feed cost?

Whether the feed is valued at forty or eighty dollars, whether the income is fifty or one hundred and twenty dollars, is there such profit that a fair return is made to you for the labour expended. For if revenue and expense just balance, showing no margin of profit at all, there must surely be something wrong, your labour has to be paid for.

Milk and feed record forms may be had free on application to the Dairy Commissioner, Ottawa, so that the profit made by each cow my be ascertained. Perhaps some cows would show profit if fed better, some won't. Many men in all provinces on the cow testing register at Ottawa show thirty and sixty dollars clear profit per cow above feed cost. You may have made more than that: if you made less, was it entirely the cow's fault?

C. F. W.

HAS DAIRY COW SOME FINER POINTS TO BE DEVELOPED?

As I look back now from the vantage ground of fifty years, it almost seems to me that then it was not so much the quality of the cows we kept or the manner of their keeping that counted with the farmers of those days as it was the number. I remember the cows my father had. He was a good feeder and he took the best care of his stock that anybody in the neighborhood did. His cows were very carefully groomed each day. I can remember now how sleek they looked; every hair seemed to lie in the right direction. And he fed grain together with his hay. He liked to have his cows give a good mess of milk, and he wished the cream to be deep on the old-fashioned pans in which the milk was set.

But never was anything said about weighing the milk of the different cows; neither did the thought enter into the minds of any of us that there was a way of knowing just how rich was the milk given by any cow, aside from the gauge of thickness on the pan. All these things have come since. We did not stop to ask what breed a cow was. So long as she was a good looking cow, not too old, and gave a good mess of milk, that was enough to recommend her if she were in the market.

Now the question is, have we come to the best in estimating the worth of our cows? Fifty years ago we could have bought four cows, and perhaps five or six, for what we must now pay for one. The price of good cows at the present time is certainly encouraging—for the man who has them to sell. For the man who buys it seems often quite prohibitive. But are we at the zenith now? Have we the best cow today? Will we ever know higher prices than we do now? In short, are there any finer points to be attained in the dairy cow? If so, what are they?

I want to confine myself to that one phase of the subject now: Can we bring out any finer points in the cow of tomorrow? It is a question every breeder of fine stock is asking himself, for it does seem to be a fact that the better cows we have, the better we would like to have. The moment we come to a place where we are satisfied with present attainments, that moment we begin to slip backward. We have got to go forward; if we do not, a thousand things attack us to pull us down.

Better Masters, Better Cows.

It seems to me to be true that our best work for the future will be in the way of perfecting types we now have. If we have cows with superi-

Now Remember!

When I ask for cocoa I want the best — and everyone knows that the best is

COWAN'S COCOA "Perfection Brand"

It is a well-known fact that in every home where quality is appreciated, this delicious cocoa may be found. It is pure and wholesome and manufactured from the best cocoa beans procurable.

See that the boy brings it.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariuess, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Severe Headaches

CAUSED BY

SLUGGISH LIVER.

When the liver becomes sluggish and inactive the bowels become constipated, the tongue becomes coated, the breath bad, the stomach foul and then ensues headaches, heartburn, floating specks before the eyes, water brash, biliousness and all kinds of liver troubles.

Milburn's Laxa-Liver Pills will stimulate the sluggish liver, clean the foul-coated tongue, sweeten the sour stomach, and banish the disagreeable headaches.

Mrs. A. Shublery, Halifax, N.S., writes:—"I take pleasure in writing you concerning the great value I have received by using Milburn's Laxa-Liver Pills for a sluggish liver.

When my liver got bad I would have severe headaches, but after using a couple of vials of your pills, I have not been bothered any more."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

FREDERICTON, - - N. B.

or points, we cannot do better than to lay every possible stress upon developing those points until little or nothing remains to be done before we can say, "I have the most perfect cow in this particular the world ever saw." This will call for more careful, more accurate, more carefully considered work than we have been giving our business in the past. In other words, the day of loose, poorly digested work is done.

What is this but saying that from now on, the best work done in this field will be done in the man himself? It is the man who must be developed, and educated, and perfected. The cow which has a master whose life is carried on according to silpshod, careless, and haphazard plans will never have a cow with better points than he has now. To attain better results in our cows we must put more of ourselves into every particular of the work we are doing. If we are not willing to do this, we may as well abandon all idea of ever doing anything that will contribute to the advancement of the dairy farming of our day.

But is it worth while to place so much emphasis on a businesslike dairying? Is it a thing a man may be proud to bring out a cow with better points and more of them than any other man has done? Just this may be the answer: The man who does not think it worth the very best there is in him is not worthy to be engaged in the great enterprise of dairy farming. It is a thing to be proud of. We may all of us feel that when we are putting the very best there is in us into the minutest details of our work, we are contributing to the betterment of the world and our fellow men.

DOES IT PAY TO RAISE ALL HEIFERS FROM DAIRY HERD?

Economy, conservation and efficiency have no worse foe than the inefficient farm animal.

Animals are expensive producers of human food for the reason that they consume much more digestible nutrients in their food than they return in animal products. Even the very best animals return only a small percentage of the food value of the grain consumed in the form of food for man. For this reason in these times of high grain prices only the most efficient animals should be raised, if we are to maintain the proper balance between different needed food products and prices paid for them.

Some go as far as to say we should eliminate our animals almost entirely to secure the most efficient results. But those who make this statement fail to realize that from the crops raised in the ordinary rotation necessary for the best production of grain, less than one-half of the total digestible nutrients contained in all of these crops are available for the food of man. Therefore, the by-products from our different agricultural crops must be at least partially utilized in the feeding of farm animals, if we are to conserve to the best advantage and keep a proper balance of the food supply from our farms. To obtain the best results then, animals must be considered in our farming methods, or a large amount of the food value of our agricultural crops will be wasted. But, as the demand for human food becomes greater, it is increasingly important to feed these products to such animals as are capable of returning the largest possible percentage of the energy which these foods contain.

Since a certain amount of animal food is essential to the well-being and health of the people; as babies and invalids cannot be properly nourished on grain and vegetable food alone; and as the good dairy cow is the most economical producer of human food of any of our domestic animals, she is to be considered in the production of animal products at the present time, and is a vital factor in the country's food supply.

But the efficiency of the cow that is kept is of even greater importance under these conditions than in times past, and if there was ever a time since the world began when the production of every individual cow should be determined and not only the inefficient once but their offspring as well go to the shambles, it is now.

In a test recently conducted the poorest one-third of a certain number of cows produced an average of 3,654 pounds of milk and 134 pounds of butter fat annually, each cow lacking about $7 of paying for her keep. Like begets like, so wherein lies the wisdom of saving heifer calves from such cows as these, where a portion of the feed consumed only helps to augment the manure pile?

While grains have increased in price, the prices of dairy products have not kept pace with them in the same ratio, and why sell grain at $20 per ton to the dairy cow when the price at the elevator or the feed store is two or three times this amount, This is only a monetary consideration and takes no account of the actual loss of grain consumed. Why should anyone want to expend his time, energy and money in raising heifers from such poor cows, or even continue keeping cows which not only fail to pay for their keep, but lose money for their owner, besides wasting grain so much needed in these trying times. Yet it has been advocated that all heifers should be raised.

The essential thing in farming operations is balance. The man who keeps such cows as these and raises the heifer calves from them fails to balance his output with his income. In other words, he fails to compare the cost of grain, labor, time, etc., consumed in keeping an efficient cow with the income received from her dairy products.

Under past conditions there has been a tremendous waste of energy caused by keeping poor cows, and if there was ever a time this great waste should be stopped it is now. It would be the worst possible economy to raise the heifer calves from poor cows in these times of high grain prices and the dairymen who did so would simply be intensifying their chances for failure. Under ordinary conditions, it is certainly not wise to save the heifer calves from the losing half of the cows and, under present conditions, it is criminal to consider raising the heifer calves from anything but cows whose production is on the credit side of the balance sheet, and which will pay present market price for food, housing and labor and leave a profit besides.

Life is not always smooth, easy sailing and it is for our best development that it is so. Many of our troubles come fro mattempting to do what should not be done. A good part of our study in agriculture is an attempt to learn how to adapt our efforts to nature. The dairy farmer has one of these lessons strongly pointed out to him at present.

To keep the dairy herds replenished with future cows it is necessary to save the heifer calves from only the best of the cows and these are the ones, if of good parentage on the sire's side that will play their part in making a living for the milk producer and a better food supply for the world.

WILBER J. FRASER.

"My boy can run our ALPHA"
"There aren't many engines I'd trust him with, but the Alpha is so simple that I know he can't go wrong."
Isn't that the kind of engine you want around *your* place—an engine that is as steady and dependable as the best horse you've got?
The Alpha doesn't have to be "tuned up" every time you want to run it. It contains no electric batteries to weaken and give trouble—no complicated parts to get out of order. To start it you simply oil it, turn on the fuel and give the flywheel a pull.
You need a gas engine and it pays to buy a good one. There are definite reasons why the Alpha is best.
Alpha Gas Engines are made in eleven sizes, 2 to 28 H. P., and each size is furnished in stationary, semi-portable, or portable style, with hopper or tank-cooled cylinder.

ABORTION STILL DEFIES THE VET.

Sir Stewart Stockman, of the British Board of Agriculture, declared recently that there is no cure for abortion. All the remedies on the market had been tested, he declared, and all had proved failures. The only preventive was inoculation. The eradication of the disease was impossible as a practical measure. Every aborting animal would need to be killed, and every in-contact animal in calf would need to be subjected to the serum test if she was affected. As a practical proposition the eradication of the disease may be dismissed, added Sir Stewart.

LIVE STOCK.

THE YOUNG BOAR NEEDS GOOD CARE, FEED AND EXERCISE

The treatment of the young boar that is intended to do serivce as a breeder, for the first two or three months, should be little, if anything, different from the one that is expected to cater to the bacon trade. In ither case the first object will be to build up a strong frame and a vigorous constitution. For this purpose at least, five essential factors will be necessary, namely wholesome food, pure water, pure air, vigorous exercise and comfortable quarters in which to feed and sleep. Since these are practically the same things that are needed to raise any domestic animals successfully, they will need to be mentioned here only as different kinds of animals and different ages need different treatment.

In common with other young pigs the boar should be liberally fed on foods that are easily digested and that contain a large percentage of protein or flesh-forming material. For this purpose no food will better form a part of the ration than milk, either whole or skimmed; but on account of the value of whole milk we will consider the latter only. One part of oil meal, two parts of shorts and four or five lbs. of milk to the pound of grain makes a very good feed for young growing pigs. When the pigs reach three or four months old, or sooner in some cases, the young boar should be separated from the sows, but it will be well to continue him with other male pigs for some time as more exercise will be taken under this treatment and also it will usually be desirable to use heavier and more fattening food at this time, with the litter, than will be desirable with the intended sire. Later on when the boar reaches a weight of one hundred to one hundred and fifty pounds the oil meal should be reduced in quantity and oats introduced into the ration which will produce a firmer flesh and muscle. At the same time all through the period of growth, it will be advisable to add a teaspoonful of bone meal with a pinch of salt to the ration or a mixture of one part salt, four of ashes and eight of charcoal placed in a box where it may be taken at will by the pig.

Again the necessity of pure water is emphasized. Water forms a very large percentage of the weight of carcass of any animal, and must be liberally supplied for good results. While the pig is prone to wallow about in mud during warm weather, at the same time he is subject to disease and parasitic trouble particularly that supplied in impure water. Hence this should be supplied in all the quantities that will be taken, in addition to any liquids that may be consumed in the food.

Pure air is as necessary for good health and strength of constitution as pure food or water. The best place to obtain this is out in a clean, fresh clover pasture, which, in addition to the benefits derived from pure air, also furnishes an opportunity to get from the clover and earth some of the natural ingredients necessary for best results, and still further, it affords an opportunity for the sun's rays to destroy many germs of disease, injurious to domestic animals. When kept in close pens, there should be good ventilation supplied to eliminate as far as possible the poisons accumulating from breathing and other bodily excretions.

Exercise is also promoted in the best possible manner when the pig is in the pasture lot and nothing is more conductive to its proper development than this. Exercise sets in motion all the organs of the body whose functions have to do with purifying the blood, firming the tissues, strengthening the nuscels and eliminating the waste products, thus giving to the whole body that buoyant health that makes for best results in any line of animal activity.

Again, in climates as severe as that of our Canadian winters, pigs must be properly sheltered no matter for what purpose they are intended. Exposure to cold storms, whether of rain, snow or wind uses up vital energy of a body at an amazing rate, which it will be quite impossible to replace by food or any kind of treatment. An animal in this condition will be of little service as a sire. Shelter is best provided in a roomy well ventialted pen with plenty of sunlight where a little hard grain roots and ensilage can be scattered amongst litter, both favoring exercise and digestion.

The age at which a young hog should be used as a breeder will depend considerably upon the growth and development he has made during the first fe wmonths of his life. Not too early, would be a good resolution; Ordinarily not before ten months and in many cases not until a year old is much better. The main thing is to have a proper development, of the system—not that a pig should have its full growth, as this will not be complete for two or three years but that all the bodily organs should be strong and active, when he may be used with reasonable expectations that good results will be accomplished. Even then the indiscriminate use of a young boar is a mistake. He should not be used too often or his growth and vitality will be interferred with. Nature, is opposed to excesses. Moderation must be practised or the law of equilibrium will be outraged, resulting in weakened constitution and general breakdown. This law will apply to all ages but particularly to young, immature animals. Judgment, reason and common sense are fine qualities to be used in connection with the management of the young boar and without which the results are likely to be very disappointing.—O. V. J.

THE HERD BULL THAT GRADES UP COMMON STOCK

It has been said that the average dairyman pays but little attention to the question of the herd bull, and that only the skillful breeder of any class of live stock realizes the importance of having a properly selected sire at the head of his herd. This proposition leaves out of consideration the great number of dairymen that are trying to get out of the average class and are attempting to build up good dairy herds. For these men the question of better producing stock is a vital one and many are beginning to realize that the building up of a profitable dairy herd must properly begin with the sire.

Improvement Through the Sire

The often heard statement that the sire is half the herd is not well appreciated by many dairymn. It is not unusual to hear the statement that so and so would not pay $25 for a registered bull calf of any of the dairy breeds. For these people a grade calf at $5 will grow into a bull and do the work just as well as a more expensive animal. Although this idea still holds in many dairy sections, dairymen are fast getting away from it and the days of the grade calf as the future herd bull are numbered. With a properly selected pure-bred sire used on a herd of common cows the improvement of the offspring over their dams will be rapid and before long it will be found that the sire not only tends

Prize Butter Makers Use

Windsor Dairy Salt

Made in Canada

THE CANADIAN SALT CO., LIMITED 224

How the Standard Gets Practically All the Cream

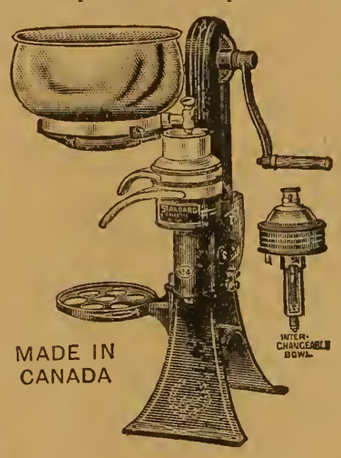
At the point where the good features of other machines leave off is the point where the Standard is just beginning to give you extra close-skimming, extra profit making advantages that open wide the eyes of everyone who cares to make comparisons. The Standard's bowl, the vital part of any separator, is unlike that of any other machine. It gets more butter-fat by far than others, and that is what counts! The

Standard

gets all but one-tenth pound of butter-fat from every 1000 pounds of milk skimmed while other machines lose a whole pound. Compare this record with that of your own or any other machine. And remember that this all-important result is proven over and over again by independent tests made at Government Dairy Schools. Here is the way the Standard out skims other machines:

First—The Standard has greatly improved the disc system. The Standard's discs are different in both size and shape and their advantages were proven by a two year test before being adapted.

Second—The Standard's exclusive curved wing centre-piece ensures perfect distribution and prevents clogging of the discs with cream. See in the picture the wide open space between the tubular shaft and the inside edges of the discs. Half of the skimming is done in that space, thus freeing the discs for perfect skimming.



MADE IN CANADA

Do You See Those Wings ?

The curve of the wings increases the distance over which the milk travels and the skimming force is multiplied many times. The curved wings distribute the milk in thin sheets equally to every disc space without clogging. There is no whipping as in the case with straight wings. That is why you can get firmer, better butter when you have the Standard to give you unbroken globules of butter-fat. And you get more of it—more prolts—because the Standard outskims all other machines.

Write for booklet describing the Standard's even spaced discs, the easy to clean and easy to turn advantages, the exclusive self-oiling system, the instantaneous clutch, the exclusive interchangeable capacity feature—many special advantages that put the Standard absolutely in a class by itself.

The Higher the Price of Butter the Greater Your Loss without the Best Cream Separator

BUTTER prices are going higher every week.

Even at present butter prices no cream producer can afford to be without a cream separator or to continue the use of an inferior or half-worn-out machine another day.

And the higher the price goes the greater your loss.

Even if you have only two or three cows a De Laval would pay for itself in a few months.

If you have a larger herd your need of the best cream separator you can buy is just so much more urgent.

A De Laval Separator bought now will more than save its cost by spring. It can be bought for cash, or if preferred, on such liberal terms that it will easily pay for itself in its actual savings over any other separator or creaming system.

See the nearest De Laval agent right away and let him show you what the De Laval will save for you. If you do not know the De Laval agent, write direct for any desired information.

A full meeting of members and prospective members is expected. All orders for fertilizers must be in the hands of the Secrtary not later than that date. Membership fee $1.25. Tell your neighbors.

M. A. MacLEOD,
Secretary.

to contribute half his characters to the progeny but often in the case of a prepotent sire more than half. The way in which pure-bred bulls transmit their characters to the offspring can be graphically shown by the following:

Generation.	Blood.	P. C. Improved.	P. C. Unimproved.
1	one-half	50	25
2	three-fourths	75	25
3	seven-eighths	87.5	12.5
4	15-16	94.75	6.25
5	31-32	96.87	3.12
6	63-64	98.43	1.56

This has possibly led to the saying that the sixth generation is practically pure and shows how to all intents and purposes that holds true. Grading up common stock in this way is the only sure way of obtaining a better producing herd. The same bull, of course, could not be used in any system of improvement, but animals of the same type, conformation and blood lines should be used. Whether grading up common stock or working with pure bred stock the breeder always has before him the well known principle that animals of the same form and characteristics tend to produce their own kind.

The Law that Like Produces Like.

The law that like begets like is the one on which all breeding operations to a large extent depend. This has been described as the corner stone on which is based the many lines of improvement as carried on by our present day breeders. When the parents are alike in breeding and other essential characters, the tendency for the progeny will be to show similar characters. Mating unlike parents tends to result in progeny differing in a varying degree from either parent, and applies to any of the characters, form, size, disposition or productive capacity. With the herd bull the tendency will be for his progeny to take on his characters or the characters of his immediate ancentry, modified, of course, by the possible indiscriminate breeding of the females in the herd. The law that like produces like has its limitations and is subject to many variations as every breeder knows, but the tendency for the offspring to be like their parents is certain and can be said to increase with the intensity of the breeding and the closeness of the relationship.

The Principle of Variations

The fact has often been noticed that the progeny of any cross may not be like the parents in many ways, be it form, size, quality or production. The progeny of a certain sire and dam may in one case result in an animal of good conformation and prduction, while the next result of the same cross may be entirely different. It smetimes happens that crossing one family within a breed upon another in the same breed results in outstanding animals, the reverse of this is also very often true. Such variations may be along the line of improvement and sometimes of regression. The causes of such variation may be from within or in many cases, external conditons, such as food, clmate, or care may have more or less to do with it. Since much of our stock has been bred along lines tending toward improvement, the desirable variations are segregated from the undesirable ones by the simple process of selecting the best. Methods of breeding as carried on by the best breeders tend toward the elimination of the undesirable characters and the keeping of the best.—R. E. Hundertmark, in American Exchange.

HANDLING THE DAIRY SIRE

While visiting some of the choicest herds of a particular breed of dairy cattle not long ago, one thing which impressed me was the difference in the way different men care for their bulls. For instance, on one farm I would find the head of the dairy in a stall that was simply perfect in its equipments; good air, plenty of light, and a kind keeper and caretaker. Needless to say that here I would see a bull that was making his mark on the quality of the calves of that breed in this country.

On another farm, and perhaps it might be only a few miles distant, I would find a man who kept his buli in a dark, poorly ventilated stable, where the floors were filthy and so little bedding furnished that the animal was compelled to lie on the bare floor, to the soiling of his fine skin and the humiliation of his spirit, for I cannot help believing that a well bred creature such as the head of a good herd ought to be, does have his sensitive feelings, and that he knows whether he is well treated or not.

PEERLESS PERFECTION
Horse High — Bull Strong — Pig Tight
It's made right—from high grade material. In the construction of our PEERLESS FENCING we use Open Hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Agencies nearly everywhere. Agents wanted in open territory.
THE BANWELL-HOXIE WIRE FENCE COMPANY, Ltd.
Winnipeg, Man., Hamilton, Ont.

Some of the bulls I saw were not only shut up in such stables as I have described; they were fastened by the neck in rigid stanchions, with little chance to move around and no possibility of seeing much of the rest of the herd of which he was supposed to be the master. It stands to reason that a bul lstabled and cared for in that way cannot do or be at his best. The offspring will not be as apt to have the fine characteristics we have a right to expect from a thoroughbred bull as it would be if conditions were more favorable.

Now, well bred bulls cost something. We pay good money for them as a rule. We demand great things of them, and if they do not come up to our expectations we sometimes charge it to the animal, whereas, if we looked at the matter from the right angle, it is we ourselves who are responsible, through our lack of good management for the failure to produce the best results. The head of a dairy ought to be the gentleman of the farm stock. Not that he should be supported in idleness. Every bull should be given a chance to work a little every day. That is for his best good and really essential to the owner's success. But in so far as his good grooming, uperior quarters and general comfort are concerned he should be given the very best we have.

Connected with the stable in which the bull is kept there ought to be a yard with a high, stout fence, in which he may work off some of his surplus steam every single day. Storm or shine, he should be given this opportunity. If he is properly watched, he will be taken in before he gets chilled in cold weather and in summer he will be protected from excessive heat. If he gets wet, we should not leave him to dry off or shiver, but give him a thorough rubbing down with dry cloths. If he is really cold, blanket him, at first lightly, then more heavily, and finally again with a thin blanket, which may be removed when the last bit of moisture has been absorbed or dried up.

Then, too, the stall ought to be light and well ventilated. Good bedding ought to be on the floor, changed frequently. We would not expect the conditions to be perfectly sanitary otherwise. And the health of the sire is of prime importance. No ice cold water ought to be given him; the chill should be taken off in cold weather. It is not a great deal of trouble to do this and the returns are well worth the effort we make.

But if all these things have been provided and we are harsh and unkind with the sire upon which so much depends, we are running great risks. Now, I do not say that we should not always be on our guard against sudden vicious impulses on the part of the bull. Anybody who understands animals of this kind at all knows that it is best always to be on one's guard against attacks which may turn out disastrously. But I do say that it always pays to be kind with these creatures. Firmness is all right; a bull should be permitted to take no liberties, neither ought we to take liberties with him.

Nine times out of then, in my experience, when a bull develops ugly traits, somebody, sometime, has not done the right thing by him. The education of a bull is a matter of the highest possible importance. Beginning with the calf, straight up through, we ought to be patient, though self-controlled, kind while masterful. No boy should be permitted to fool with the bull calf. No dog ought ever to be allowed to worry him, whether young or old. All proper safeguards should be thrown about the handling of the bull, and still, there is no more perilous thing than ever to lose the temper and misuse the bull, no matter what the provocation. For you never can punish ugliness out of a bull. You only make matters worse by attempting to do it. To strike, prick or in any manner hurt such an animal only arouses the very worst instincts and adds fuel to the fire. The best way—the only way—to be sure of safety is to deal so fairly with the bull that he will not develop ugly characteristics.

In short, while a bull is a bull, he ought to be looked upon as the most valuable and highly prized animal on the farm. In no other way can we be sure of getting the best service from him.

THE HORSE

WEANING THE FOAL

How many farmers who own a mare and sucking colt ever stop to consider what the word "weaning" really means. The practice of the average farmer is plainly evident. He works the mother, sometimes not very judiciously and when he thinks the colt is old enough, he simply takes it away from her for good. But weaning means a gradual process, and it is a question of preparation more than anything else. Long before the final separation of mother and colt, the colt should be encouraged to eat a little grain, and ground oats is the best feed. It will begin to munch hay, grass or grain at three or four weeks of age and continue. This really commences the duty that will end in successful weaning.

Training the colt to lead and to drink a little skimmed or separated milk will help to retain the foal flesh, when the mother's milk is taken away. Never feed the colt milk from an unclean vessel. In addition to ground oats, a little oil meal is very beneficial, about half a pint a day. The effect of such a ration—sweet skimmed milk, ground oats and oil meal—on the growth and development of a foal is remarkable. and in all cases when the foal is likely to enter winter in low flesh, such a ration cannot be too highly recommended.

This business of feeding and training the young colt must be undertaken while the colt is still with the mother. The simplicity of the weaning process depends on the thoroughness of that preparation. If the foal has been accustomed to handling and feeding at this early age, the grain ration can be increased slightly as it grows. The process then becomes simple. for as the ration of ground oats and oil meal increases the amount of milk can be decreased. When the time arrives for complete separation, there will be very little if any set back or disturbance to either foal or mother. On the other hand, if the foal must learn to eat after it has been suddenly deprived of its mother's milk, it will take a long period of time to train it to take any substitute. Loss of flesh is the result, and the excitement displaces its nerve energy. Loss of appetite and impaired digestion begins the stunting of the foal, that ends in an undeveloped animal at mature age. The very best breeding is not able to contend with or surmount the evil influence of this practice. The weaning of the colt is therefore of primary importance to the success of the horse-breeding industry.

If the proper weaning of the colt is considered a bore and bother on the farm, horse breeding should be left alone. It is a special work and demands some time, and a farmer endowed with special tact of observation. Feed must be given liberally. Many colts are permanently injured the first six months after weaning by too scanty supply. The method to feed a colt before and after weaning can be learned by watching the youngster feeding when with its mother. It sucks often, and in small quantities at a time. The mother's udder holds no great supply at one time. The hand feeding of the colt must be done on the same principle, often and regular with small quantities at a time.

If the mother has been bred early after foaling, and proves in foal, it will be better to wean the foal early, and there is no way of doing this, with advantage to the young foal, than by the plan suggested of early preparation. Early weaning of the colt in this case gives the mare opportunity to regain her usual vigor and health and will aid in nourishing the young fetus.

If for any reason the mare or foal are not doing well, it is best to wean early. The mare will have a better chance to regain her normal condition, and the colt will be healthier if properly fed, than when sucking the dam that is in an unhealthy condition. If the mare is healthy, and is again in foal, but is not working, or is kept entirely for breeding, it is not at all necessary to wean the colt early. This is a natural condition, it is only when a mare has to work hard, and is in foal while she is nursing a young colt that weaning early must be resorted to, and early feeding a necessity.

When the mare and th colt have been separated, they should be kept separate; constant remembrances by sight, smell or hearing only prolong the period of unrest and loss of appetite. But don't put the little fellow away to the bush or rough pasture where colts, a year or two older, are pasturing. This practice is doing more damage to horse breeding than anything else, and it is all too common on Canadian farms. It is such a beginning that produces the spiritless, dejected, weak-stomached and short-lived horse.

The work mare will require some special care, when the colt is finally weaned. If she has been receiving additional rations to encourage the milk flow, they should be discontinued. Work the mare right along if she has been at work, but reduce the grain ration till she is dried off.

NEVER SLIP
RED TIP
Conserve time, money and your horse's strtngth by using
RED TIP CALKS
They will enable your horse to travel on slippery, icy roads and streets in absolute safety. They can be adjusted in a few minutes and make you ready for the road any time—day or night—eliminating danger and delay.
Neverslip Calks and Shoes always have Red Tips
Get them from your horsehsoer now.
Booklet J will be sent free on request.
THE NEVERSLIP WORKS, 559 PIUS IX AVE., MONTREAL
U. S. Factory, New Brunswick

In drying off the mare, it is not necessary to milk her dry every time. When the udder becomes so full as to cause uneasiness, part of the milk should be drawn, but she should not be milked dry. If the milk is all withdrawn each time, it will take longer to dry her.

The mare and her little colt deserve more care and attention than is generally meted out to them. The brood mare that takes her allotted share of the labor on the farm, is the most intensely used animal on the farm. She is not naturally adapted to fulfil a full day's work, and nurse her colt properly at the same time. She carries no alrge receptacle, like the cow, to hold a large supply of milk, nor has the colt got the calf's stomach to hold it. The milk supply of the mare is almost continuous and the digestive organs of the little colt are so arranged that they can receive it only in the natural way, that of almost continuous sucking.

To meet this arrangement of nature some farmers allow their colts to follow their mothers all day at work, but this practice is not to be recommended. The colt is liable to meet with an accident through contact with implements, etc., and the over-exercise which the practice entails counterbalances any benefit that would otherwise come to the colt from the opportunity to suck as often as it chooses. Keeping the colt in while the dam is at work gives the owner the best chance to start the weaning operations. When the world returns to a normal condiiton, and for ten years after, the horse industry will command attention, and those today who are giving proper care and attention to the mare and colt on the farm, are those who will be winners in the race to meet the new demand.

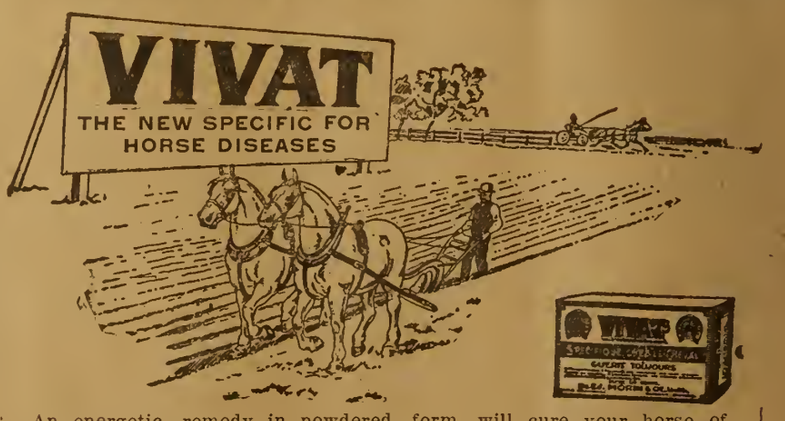
HORSE STABLE FLOOR OF BLOCKS OR CEMENT

Please let me know if for making a floor in a horse stable cedar blocks stood on end would be a good plan? What is the best way of putting them in? Would putting cement in first and sinking the blocks into it be a good plan? B. T. W.

Ans.—Cedar blocks in a dirt foundation would not make a good floor for a horse stable as the urine would soak init it and become unsanitary, and besides this the ground soon becomes soft and the floor will settle in places causing an uneven surface. The blocks on cement would be much better if the spaces between them were carefully filled up with a mixture of sand and cement and firmly pounded in and afterward a coat of hot coal tar poured over and swept into all parts to fill up the pores of the wood and stop absorption.

In any case the blocks should not be used for any part of the floor other than that where the horses stand. While they would last a long time they could not be laid smooth enough to clean off easily, hence would likely be neglected and be found more or less unsanitary.

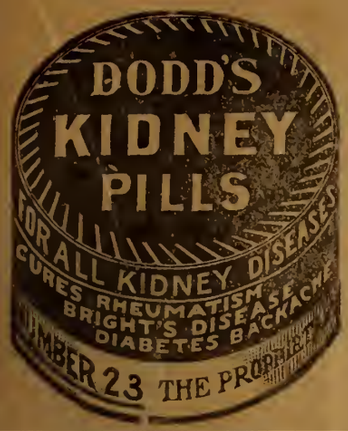
The modern way of putting down a horse stable floor is to lay the whole



An energetic remedy in powdered form, will cure your horse of COUGHS, HEAVES, COLICS, WORMS.
"VIVAT" also strengthens and gives endurance to DRAUGHT-HORSES as well as RACERS. Many prominent Veterinary Surgeons have tried it with success in critical cases—One 50c box is sufficient for six days' treatment.

FOR SALE BY ALL PROGRESSIVE MERCHANTS.

DR. ED. MORIN & CO., LIMITED, QUEBEC, CANADA.



surface with cement properly graded for keeping the urine in its place and then covering the stall part with plank. The cement will last indefinitely and the plank is easily laid and repaired when necessary. This makes a floor that is easily kept clean, is perfectly sanitary, and much preferable to the cedar block in every way.

HIDE-BOUND AND SCRATCHES IN MARE

(1) I have a young mare that is not in proper condition. I think her blood is out of order and her bowels do not act as they shuld. She is also hide bound.

(2) Will caustic stick be of any help in removing the lumps that follow scratches?

(3) Will camphor gum, dissolved in gasoline, give any more power to the motor,

Ans.—Hide bound is the effect, not the disease itself. The general ill-health of your mare may be due to indigestion, diseased teeth, exposure to cold in the winter time and starvation. A thin condition is usually an accompaniment of hide bound. Examine the teeath, as horses are often as much bothered with tooth troubles as are their human attendants. Give her a purgative consisting of 6 drachms Barbadoes aleos and one pint linseed oil mixed. Give a teaspoonful of salertus in soft feed, once a day for awhile.

(2) If proud flesh springs up in the cracks, burn it down with burnt alum.

(3) Camphor gum when placed in coal oil will give a brighter flame where coal oil is used in lamps, but we would not advise its application to gasoline as your question suggests.

HORSE IS LAME BY INTERFERING

I have a horse that is lame, caused by one foot hitting the fetlock joint. How should I treat it; the lameness has been for a long period now?

M. O. M.

Ans. You horse is interfering, and it may be caused by a variety of causes that make the horse brush the foot that is going forward against the other leg. Colts, before being shod, seldom or never interfere, but often do it as soon as shod. The shoeing is a common cause, the foot is often pared down too much on the inner side, tipping the fetlock in so as to bring it in the way of the other foot. Malformation is another cause, also leg weakness and thinness of flesh. The first thing you should do is to apply a boot or roll of leather strapped round the injured fetlock. Nicely fitting boots for all parts of the leg can be bought, and when once you have fitted one on, proceed to remove the cause. Take the horse to a shoer who is an artist at the business. As a rule no two feet are alike, and it requires an artist and a mechanic to change the position of the feet and legs relatively. A good rule to follow is to shoe so as to tip the fetlocks out, giving the feet roo mto pass without brushing. This is done by leaving the inner side strong and paring down the outer side, which will throw the centre of gravity in a new line and often prove successful. If the horse is overworked, thin and weak, give him a rest and a little better feeding. There is no plan much more effectual than to spread the legs with good solid flesh, making him travel wider.

HOME MEDICINE CHEST

Every home needs a medicine closet as there are likely to be many minor accidents and ailments in even a well conducted home. In the chest it is wise to keep only medicines that are needed in the common ills. If the medicine is not kept in a definite place it is often hard to locate in case of an emergency. Then, if there are children, the desire to know what is inside a bottle will sometimes cause illness or even death. A box measuring 10½x4½ inches will hold the necessary medicine and will keep the medicine away from childish hands. It is safe and wise to label every bottle.

The fololwing medicines should be found in every home medicine chest: Alcohol, used externally for strains, sprains and bruises; aromatic spirits of ammonia, a stimulant used in fainting when added to water; castor oil, a mild purge; powdered mustard, one teaspoonful in a glass of lukewarm water to cause vomiting, and in a plaster as a counter irritant; syrup of ginger, for cramps in the stomach; syrup of ipecac, used to cause vomiting and especially useful in cases of croup; carbolated vaseline; talcum powder; white castile soap; absorbent cotton (one-half pound); six gauze roller bandages; one roll adhesive plaster; collodion for slight injuries of the skin; pair of scissors; teaspoon; two bent glass drinking tubes; fountain syringe with glass points; cold cream or hand lotion for chapped hands; lip salve, equal parts of lanolin and vaseline.

National or world conservation can only be accomplished through individual conservation. Whether or not your circumstances make it necessary for you to conserve food products, the circumstances of the nation call upon everyone to conserve.

LOST APPETITE, POOR BLOOD

C.E. Sapper says Dr. Cassell's Tablets Best Tonic anyone can take for Weakness

Sapper A. Hartley, Canadian Engineers (home address, 906, Trafalgar-street, London, Ont.), says:—"I used Dr. Cassell's Tablets when I was in the South African War, and finding benefit have taken them since whenever I felt run-down. In my opinion they are the best tonic anyone can take for loss of appetite, poorness of the blood, and general weakness of the system. I never fail to recommend them, and mean to have some with me on active service."

A free sample of Dr. Cassell's Tablets will be sent to you on receipt of 5 cents for mailing and packing. Address: Harold F. Ritchie and Co., Ltd., 10, M'Caul-street, Toronto.

Dr. Cassell's Tablets are the supreme remedy for Dyspepsia, Kidney Troubles, Sleeplessness, Anaemia, Nervous ailments, and Nerve paralysis, and for weakness in children. Specially valuable for nursing mothers and during the critical periods of life. Price 50 cents per tube, six tubes for the price of five, from Druggists and Storekeepers throughout Canada. Don't waste you money on imitations; get the genuine Dr. Cassell's Tablets.

Had Chronic Indigestion Thought She Would Die

After Years of Suffering Attributes Cure to Dr. Chase's Kidney-Liver Pills.

Eating too much or using foods that do not agree are the usual causes of indigestion.

The trouble usually begins not in the stomach, but in the liver, since it devolves on this organ to filter the excess waste matter from the system.

Now, since Dr. Chase's Kidney-Liver Pills are the greatest of liver regulators, it naturally follows that they are unexcelled as a cure for chronic indigestion.

With the liver, kidneys and bowels active the poisonous waste matter is quickly removed from the system and there is nothing to interfere with the natural and healthful working of the organs of digestion. In this way only can lasting cure be effected.

Mrs. Rebecca Elliott, Magnetawan, Ont., writes:—"I feel it my duty to write you in regard to Dr. Chase's Kidney-Liver Pills. I had gastritis of the stomach for three years, and could get nothing to stop it until I tried Dr. Chase's Kidney-Liver Pills. I would have an attack of this trouble with my stomach every three or four weeks, and was so bad at times that my friends thought I would surely die. Thanks to these pills, I have not had an attack for six months, and believe that the cure is thorough. My husband has had very satisfactory experience with Dr. Chase's Nerve Food He was much run down, and very pale and weak. I persuaded him to use the Nerve Food, and after having taken five boxes he looks and feels real well."

It is such experiences as these that have made a place for Dr. Chase's medicines in the great majority of homes. They do not fail, even in the most complicated cases. Dr. Chase's Kidney-Liver Pills, one pill a dose, 25 cents a box. Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.50. All dealers, or Edmanson, Bates & Co., Limited, Toronto.

POULTRY.

POULTRY DISEASES RESPONSIBLE FOR BIG NATIONAL LOSS

At least fifty per cent of the chickens, young ducks and turkeys and ten per cent of the adult birds die each year from diseases, many of which are preventable. This is an annual national loss of probably millions of dollars that could be avoided to a large extent.

War conditions mak it imperative that farmers and poultrymen, as far as possible, stop this enormous leak and in order to assist in this connection, Dr. Wickware suggests that every breeder pay strict attention to the general conditions of his flock in order that any ailing birds may be immediately isolated. When anything unusual is noted in a fowl, it is advisable to place the affected individual in separate quarters. If within a short time recovery does not take place it is unwise to destroy the fowl without first ascertaining the cause of the disorder. The prevalence of diseases is more often the cause of the poultry-keeper's failure than in the lack of practical knowledge. The extreme importance of keeping the quarters clean; isolation of all ailing fowls and immediate action in regard to finding out the cause cannot be too strongly impressed upon the poultryman.

When trouble occurs, forward to the Biological Laboratory, Central Experimental Farm, Ottawa, Ont., a live but sick fowl, or in the absence of such, a dead bird. In the interval, disinfect the quarters, runs, drinking fountains and feed dishes to check the spread of any infectious disease.

Disinfect the poultry houses by spraying the interior with a limewash solution (50 lbs. stone lime slaked in a barrel of water plus one gallon of a good commercial disinfectant.) Fill cracks and crevices to destroy mites, lice, etc. If a smaller amount is required it may be prepared by adding two and a half pounds of lime to a pail of water plus half a teacupful of disinfectant.

The Yards

Keep a crop growing in some part of the yards and alternate poultry and crops. If the runs are small, cover with a coating of air-slaked lime and dig up. If the runs are too large to dig, polugh and cultivate before sowing. Rape sown in the early part of the summer, after the breeding season, or early in September makes a good crop for this purpose. Rear all chicks on fresh soil.

Although these precautions may appear unnecessary, it is the only way of combating many disease conditions affecting poultry, which, if left to themselves will undoubtedly prove decidedly costly in the long run.

CUMBERLAND COUNTY POULTRY

It is some time since you have heard anything from Cumberland or the Cumberland County Poultry and Pet Stock Association. But we are still alive and hard at work trying to liven up the poultry industry of Cumberland, which has been particularly dead for many years. But we have succeeded in getting them started, and have obtained a car of Buckwheat Screening from the Government, which has proven a great draw card. The Assoc. are also taking up other feed questions in the interest of the members.

We are holding our first annual show Nov. 27th, 28th, and 29th, 1917, in the Curling Rink, Amherst, N. S. This building is an ideal place for a poultry show, and it has been obtained with rent and light free. As there is no Maritime Show this year the Cumberland County Poultrymen should make it an effort to come to Amherst on Nov. 27th, 28th, and 29th. As we are offering extra good prizes and a large list of specials. The entries close about November 10th, with the Secretary, V. G. Fuller, Amherst, and prize lists can be obtained free from him. Every one reports their birds in better shape than ever this year, and despite the high cost of feed, they have raised good size flocks.

Cumberland County is FORWARD to the front lines in poultry from now on, and we would advise other counties to look out, for when Cumberland starts anything it goes.

Cumberland County and
Greater Poultry.

HENS REQUIRE PROTEIN

For best egg yields hens need some animal protein supplement in connection with corn. Meat scrap and tankage may be used for this purpose.

Hens fed 1.6 pounds of meat scrap in a feeding test produced an average of 92 eggs in one year. Another lot given 11.6 pounds of meat scrap produced 141 eggs per hen in the same time. The extra feed costing 19 cents a hen returned a profit of 74 cents.

Tankage was a satisfactory substitute for meat scrap in the ration for laying hens in another test and reduced the cost of production. While hens fed meat scrap along with corn and bran laid 121 eggs per hen in one year, others fed tankage in place of meat scrap produced 22 eggs per hen at a slightly lower cost.

DON'T WASH EGGS

Except for immediate use or for local customers who use fresh eggs soon after delivery, never wash eggs even if soiled. Egg investigations show that over five million dozen eggs spoil unnecessary because they were washed or in ome way became wet before going into cold storage. Washing eggs dissolves and removes the natural gelatine covering which prevents germs of decay from getting through the pores of the egg shells.

Neither should eggs to be stored in water glass or other preservative be washed. If shells are badly soiled, better use the eggs for cooking purposes and spend the time needed for washing eggs in keeping the nesting material clean and providing clean dry litter in the laying rooms.

SELLING FEATHERS

There is usually a ready market for prime feathers that have had proper care and poultry raisers should not overlook the profits that may be made from this by-product. Feathers of ducks and geese are especially valuable, but sometimes even chicken feathers can be sold at a price well worth the trouble to save and care for them. Feathers should be picked when ripe, that is, all the animal matter should be out of the quill. At this stage they are easily plucked without damage or inconvenience and will not spoil or become motheaten It is advisable to separate the body feathers from those of the tail and wing, and assort them according to color. White feathers are particularly valuable.

They should be kept in a cool airy room, either in jute sacks which allow the free circulation of air among the feathers, or in open bins where they can be frequently forked over to keep them from matting.

FEED COST OF PRODUCING EGGS

The cost of feed for producing eggs with pullets and yearling hens, both from Leghorns and from general purpose breeds, in the experiments on the United States Department of Agriculture farm, Beltsville, Md., during the past year, even with the high price of grains, has been considerably lower than the price received for nearby fresh eggs.

Leghorn pullets ate an average of 4.8 lbs. of feed in producing a dozen eggs. The feed costs on an average 12.9c per dozen eggs produced by the flock. The cost of feed per dozen eggs varied from 9.2c in July to 41.4c in November, when, during the moulting season, the flock continued to eat, but o fcourse produced fewest eggs. The number of pounds and the cost of the feed consumed per dozen eggs for each four-week period during the year were as follows, beginning Dec. 1: Pounds of feed: 5.3, 6.6, 5.4, 4.7, 3.3, 3.0, 3.0, 3.2, 4.9, 4.8, 8.6, 10.9, and 18.4; cost of feed: 12.0, 16.4, 13.7, 13.5, 10.3, 10, 10, 10, 9.2, 9.2, 16.8, 22.4, and 41.4c.

Leghorn yearling hens ate on an average 5.5 lbs. of feed per dozen eggs produced. The average cost of feed per dozen eggs produced by the flock was 14c. The cost of feed per dozen eggs varied from 7.3c in July to 266.3 ($2.663' in November (moulting period). The number of pounds and the cost of the feed consumed per dozen eggs produced by the flock for each four-week period beginning Dec. 1, were as follows: Pounds of feed: 20.3, 10, 5.8, 5.1, 3.6, 3.3, 3.3, 3.4, 3.9, 5.3, 7.1, 30.8, and 118.7; cost of feed: 45.9, 24.8, 14.7, 14.7, 11.1, 11, 11, 10.6, 7.3, 10.1, 13.9, 54.3, and 266.3c.

General Purpose Breeds.

The general purpose breeds ate considerably more feed than the Leghorns, the pullets consuming an average of 6.7 lbs. of feed, and the yearling hens 9.6 lbs. in the production of a dozen eggs. The feed cost averaged 16.75c per dozen eggs for the pullets, varying from 11.7 to 28.9c; and for the yearlings averaged 24.5c, ranging from 13.9 to 81.3c. The number of pounds and the cost of the feed consumed by the pullets in producing a dozen eggs for each four-week period beginning Nov. 1 were as follows: Pounds of feed: 10.9, 7.4, 10.9, 5.5, 5.8, 4.6, 4.4, 4.7, 4.7, 6.3, 6.9, 9.2, and 14.1; cost of feed: 24.4, 16.8, 27.1 14, 16.6, 14.3, 14.7, 15.6, 14.7, 11.7, 13.2, 17.9, and 28.9.

For the general purpose yearling hens the amounts per dozen eggs were as follows: Pounds of feed: 34.6, 32.9, 32.7, 12.6, 8.5, 5.7, 5.3, 6.1, 6.4, 7.5, 7.6, 10, and 21; cost of feed: 77.7, 74.5, 81.3, 32, 24.5, 17.7, 17.7, 20.3, 20, 13.9, 14.5, 19.5, and 43.1c.

The average cost of the mash and of the scratch mixture per 100 lbs. for each month, beginning in July, 1916, was as follows: Mash: $1.82, 1.85, 1.88, 2.02, 2.19, 2.24, 2.33, 2.42, 2.70, 2.96, 2.98, and 2.84; for scratch mixture: $1.90, 1.98, 2.03, 2.09, 2.30, 2.29, 2.64, 2.66, 3.05, 3.25, 3.68, and 3.41. The cost of the feed used in producing eggs can be figured from the amount of feed required to make a dozen eggs the year, or feed prices may be compared with those used in this work.

POWDER YOUR HENS BY MACHINERY

A hen may be healthy, well fed, and well housed, but if she is over run with lice and mites she cannot remain a profitable producer or a good mother for the young chicks.

Under ordinary conditions, lice and mites can be kept down by frequently spraying the poultry houses, roosts, dropping boards and nests and by providing a good dusting bath for the birds. When these precautions fail, individual treatment must be followed by dusting the birds with some good insect powder. In large flocks this is very laborious, and the following use of an old discarded churn may help to solve the problem.

Put a cupful or so of insect powder in the chorn. Next put in the birds one at a time and turn the churn gently for a half dozen revolutions.

PULVERIZED LIMESTONE
SWEETENS THE LAND AND PRODUCES HEAVY CROPS
The demand last season for our "Clairmont" Brand Pulverized Limestone was so heavy we were unable to fill a great many orders. We expect a very heavy business for 1918 and would advise all booking now and getting their supply early. Our Limestone is showing wonderful results.

HAD TO GO TO BED KIDNEYS SO BAD

COULD NOT STAND STRAIGHT.

Women should not despair even if they are troubled with severe pains in the side or back, and not able to attend to their household duties.

The kidneys of course, are to blame nine times out of ten, but they can be promptly and permanently made healthy by the use of Doan's Kidney Pills.

Mrs. H. M. Jansen, Pathlow, Sask., writes:—"I feel it my duty to recommend Doan's Kidney Pills to anyone having weak kidneys, as they have been a great help to me. A month ago my kidneys were so bad that I had severe pains in my sides and back, and it was impossible for me to stand straight. I then got so bad I had to go to bed, and was that way for a week. We sent for some Doan's Kidney Pills, and I have taken just about one box, and now I am able to be up and do my own work. I am certainly grateful for the good they have done me."

To ensure getting Doan's Kidney Pills when you ask for them, see that they are put up in an oblong grey box with our trade mark of a "Maple Leaf" on the label.

Price 50c. per box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

If the powder contains carbolic acid or some other strong irritant, it will be well to protect the birds eyes by slipping a small cloth sack over their heads.

The rotation of the churn causes the bird to relax and the feathers to open, thus letting the insect powder get well into the skin.—C. S. Anderson.

BLACK HEAD DISEASE AMONG THE TURKEYS

Blackhead in turkeys is caused by a parasite and is characterized by great sores in the caeca (blind intestines) and liver. This microscopic parasite causes irritations, destruction of the tissues, and nearly always the death of the affected turkeys.

The characteristic symptoms of the disease are as follows: The loss of appetite and tendency of affected birds to stand apart from the rest of the flock is common. When the intestines are severely affected the birds have diarrhea and the droppings are liquid and stained orange yellow; this is a characteristic symptom. Diseased birds are frequently found dead under the roosts.

The only sure means of diagnosis, however, is by post-mortem examination of a bird that has recently died. The bird should be cut open to expose the internal organs, and the liver and caeca examined. The presence of large sores in the substance of the liver and in the caecal walls is sufficient evidence for a diagnosis. The caecal sores may vary from a single point to large scabs covering nearly all the lining of both caeca. The liver is very much enlarged and the sores on it are two-fifths to three-fifths of an inch in diameter.

At the present time there is no known cure for this disease and the only means by which it can be con- On farms where an outbreak has octrolled is by preventive measures. curred, all the turkeys which have not come down with the disease should be marketed for meat and not sold for breeding. Nor should eggs from an infected flock be used for hatching. It would be well not to attempt to restock a farm with turkeys for several months, and not until a thorough disinfection of the premises has been made, by exposing the grounds to the hot summer sun and by the liberal use of freshly slaked lime in the poultry houses, roosting places and feeding pens. A fresh start may be made by hatching turkey eggs under hens, or by obtaining fresh breeding stock from a non-infected district. It is recommended that turkey raising be conducted on dry, sandy, well-drained lands, since blackhead seems to be prevented in large part by dryness of the surroundings.

TREATING FOR ROUP IN POULTRY-YARD

Can you tell me what disease our hens have and what to do for them? In the first stages of the disease the comb becomes pale and the eye, or sometimes both eyes, swell up and become very red. Inside the mouth at one side from the eye and ear pus forms in a little cavity which seems to lead down the throat. Then the swelling goes down a little and becomes less inflamed, while the eye becomes materated. The disease seems to be contagious.—G. H.

Your hens have the common disease called roup. Usually the comb turns dark and then pale, and probably with your hens this was the case, but you did not notice it. This disease is a contagious catarrh and the cankers in and about the mouth indicate that roup is of a diphtheritic nature.

The best treatment is prevention, and in order to stop the spread of infection all birds having the disease should be isolated, men and animals should not go from infected coop and yards to uninfected flocks, the yards and coops should be disinfected with a five per cent. carbolic acid solution or some good coal tar disinfectant, potassium permanganate of potash should be used in the drinking water and all dead birds should be burned or buried deep.

Local treatment helps sometimes, but if the bird is not a valuable one it usually does not pay. The painting of the diphtheritic patches with tincture of iodine will usually suffice. If false membranes reappear they may be burned out with a fifty to seventy-five per cent. hydrochloric acid. In using this, care should be taken to not touch unaffected parts.

Roup generally is caused by exposure to dampness and cold. Often it breaks out whenever such weather conditions prevail. Vigorous stock is better able to resist the disease than others and cleanliness in feeding and watering is a preventive measure.

Worth Protecting

A good article is worthy of a good package. A rich, strong, delicious tea like Red Rose is worth putting into a sealed package to keep it fresh and good.

A cheap, common tea is hardly worth taking care of and is usually sold in bulk.

Red Rose is always sold in the sealed package which keeps it good.

639

PROVINCIAL PRODUCTION COMMITTEE WITH GOVERNMENT ASSISTANCE PLAN FOR 1918.

The Provincial Production Committee met in the office of the Secretary for Agriculture on Tuesday, October 23rd, with the Chairman, E. A. Schofield, presiding.

It was decided to entertain distribution of grain next spring and the Secretary for Agriculture was instructed to ascertain prices on the following minimum quantities: wheat, 300 bushels; buckwheat, 1000 bushels; barley, 1000 bushels and oats, 15,000 bushels.

The prospective scarcity of fertilizers was discussed at some length and quotations submitted by several firms were considered.

Mome mixed fertilizers were favored, but upon the advice of one of the members, who has had extensive experience in this work, it was decided to allow the purchasing of chemicals to stand over for a time. One quotation was for 1500 tons of a 3-6-5 mixture delivered at any station in New Brunswick, in car-load lots; fertilizer to be in 100 lb. bags or in barrels, the latter at a slight increase over the frmer. The potash is guaranteed water soluble. The Department is taking the necessary steps to ascertain the value of the guarantee and also to learn more about the source.

This committee, cooperating with the Department of Agriculture, wishes it made clear that this movement is strictly a war measure and is not for the purpose of interfering unduly with any existing business.

The fertilizer is now available, if an agreement can be made, and to ensure this supply of potash fertilizers is the motive.

Last spring the demand for fertilizers was greater than the supply and the prospects are that a similar condition, only more so, will exist next spring. If a demand for chemicals other than potash is manifested, no doubt the Department will seriously consider handling any that may be secured.

The above supply of 3-6-5 fertilizers, or any secured subsequently, will be sold on a cash basis or upon a bank settlement, where the purchasers arrange the necessary credit with their local bank. Delivery will be made upon advice of the bank manager. Nothing less than car-load lots will be sent to any point. All Agricultural Societies will be circularized immediately and they may order through their Secretary, and make the necessary arrangements at their local banks as organized bodies.

WHEN YOU KNOW A FELLOW

When you get to know a fellow, know
his joys and know his cares,
When you've come to understand him
and the burdens that he bears;
When you've learned the fight he's
making and the troubles in his
way.
Then you find that he is different
than you thought him yesterday.
You find his faults are trivial and
there's not so much to blame,
In the brother that you jeered at
when you only knew his name.

You are quick to see the blemish in
the distant neighbor's style,
You can point to all his errors and
may sneer at him the while;
And your prejudices fatten and your
hates more violent grow
As you talk about the failures of the
man you used to know.
But when drawn a little closer, and
your hands and shoulders touch,
You find the traits you hated really
don't amount to much.

When you get to know a fellow, know
his every mood and whim,
You begin to find the texture of the
splendid side of him;
You begin to understand him, and you
cease to scoff and sneer,
For with understanding always pre-
judices disappear.
You begin to find his virtues and his
faults you cease to tell,
For you seldom hate a fellow when
you know him very well.

When next you start in sneering and
your phrases turn to blame,
Know more of him you censure than
his business and his name;
For its likely that acquaintance would
your prejudice dispel
And you'd really come to like him if
you knew him very well.
When you get to know a fellow and
you understand his ways,
Then his faults won't really matter,
for you'll find a lot to praise.

—Edgar Guest.

WRITING NOTES AND LETTERS OF ALL SORTS

The ability to write a graceful note or an interesting letter is an accomplishment of far more value to its possessor than most people imagine. We have to judge each other in this world more or less by appearances. A woman may have the usual amount of cultivation coupled with great natural refinement or the sweetest disposition under the sun, but if she writes awkward notes and slipshod letters, her friends will conclude that there is something lacking in her education; and a stranger receiving a communication of this sort cannot be blamed for putting her down as rather ill-bred when the exact opposite may be the case, and the whole trouble be caused simply by carelessness or lack of attention to details, which after all count for so much. For as the girl said, when chided for vanity of being told that beauty was only skin-deep, that she was not accustomed to seeing people without their skins; so, as regards social usages, particularly when pertaining to letter-writing, it is impossible to look into the hearts of our correspondents and discover their good intentions; we can only judge by the surface as it were, and a well or ill written note naturally raises or lowers the letter-writer in our estimation.

Correct Stationery.

Let us begin at the very beginning of the gentle art of writing notes and take up in the first place the note paper. Society is very particular in this respect and demands that paper of a good quality be used, either in white or cream, or at most in very dull blue or gray. But the white paper is considered in the very best taste. The surface may be either the smooth vellum finish or the rougher linen as preferred, but the quality must be good, not flimsy and cheap. Letter paper is so inexpensive nowadays that even the woman of very modest means should experience no difficulty in getting proper stationery. Never, under any circumstances, use ruled paper; this is intended only for little children, and should be discarded just as soon as one has learned to write properly. Square envelopes are always in good taste, and at present fashion sanctions the use of envelopes a little longer than they are square for friendly correspondence. It used to be the custom to have ciphers, crests, or monograms emblazoned in gay colors on the note paper, but at present these are little used and it is considered in better form to have simply the address of the city residence or the name of the country place printed, either in black or colors, about three-fourths of an inch from the top, either in the center of the sheet or at the right-hand corner. This is a very sensible and convenient custom, especially for the dwellers in large cities, where addresses are difficult to remember. A glance at the stationery at once shows the whereabouts of the correspondent.

When addressed paper is not used, and its uses, although most convenient and fashionable, is not at all obligatory, the address of the sender of the note or letter is generally written in the upper right-hand corner of the note paper and the date written from the left-hand corner of the last sheet at the end of the letter, directly after the signature.

Whether or not letters should be sealed with sealing-wax is simply a matter of personal preferance. Fashion sanctions the custom, but it is no longer considered necessary to fasten up one's letters in this way. Some people always do it, however, impressing a small monogram or crest into the hot wax. This is perfectly correct if one cares each time a note is written to take the trouble it entails, but most of us consider ourselves to do so.

Addressing the Envelopes

The first line of writing on the envelope should be the name of the person to whom the letter is addressed, always with his or her proper title as Mrs., Miss or Mr. Never write simple "Mary Smith", or "John Brown," but always "Miss Mary Smith," "Mr. John Brown." If the letter is written to a child it should be addressed "Miss Mary Smith", no matter what the age of the recipient, while "Master John Brown" is the proper superscription for a little boy. Beneath the name of the recipient on the envelope and a little to the right, comes the number of the house and name of the street writtn in one line, in the next line comes the name of town or city, and then the State. If the place is a small one it is best to write also the name of the county, either in a line by itself before the State or else in the extreme lower left-hand corner.

If it is necessary to put c|o (in care of) that should be written together with the name of the person to whose care the letter goes, either in a line below the name of the person to whom the letter is addressed or else in the lower left-hand corner.

The ink used in writing notes and letters should always be black. Our mothers used to use a pretty shade of violet ink, but this is no longer fashionable.

Composing the Note

Having acquired the correct stationery, the right sort of ink, and whatever kind of pen we prefer, let us now proceed to the busness in hand. In the first place, before writing a word, it is well to sit down for a few moments at your desk and quietly think out what you want to say, and then when you begin to write you will find that your ideas flow much more easily. It used to be considered necessary to leave a narrow margin on the left side of the note paper, but although this is a very good plan, and gives the correspondence a neat appearance, it is no longer imperative and many of the best-educated people write all over the paper. But there is one practice that never must be indulged in and that is to cross your writing; time is short and modern eyesight too precious to read communications crossed like a checkerboard.

The Salutation

The address to the person for whom the note is intended, or "salutation," as it is called, should begin half an inch below the address of the sender at the extreme left of the page. Society has decreed that the expression, "My dear" is a little more formal than simply "Dear." Thus if an accquaintance is written to, "My dear Mrs. Brown" should be the proper form, while if the intimacy is greater, "Dear Mrs. Brown" would be the way to address her. If it becomes necessary to write to an absolute stranger the full name shauld be first written on one line and directly under it, a little to the right, "Dear Madam", or "Dear Sir", as the case may be. Thus

Mrs. John M Br.own,
Dear Madam,"

would be the proper salutation.

Letters to tradespeople are generally written in the third person, something like this: "Mrs. John M. Brown, 16 Prospect Terrace, Glenville, New Jersey, would like Smith, Jones & Co. to send her immediately six bottles of their best salad oil by express. Enclosed find check for the amount."

It goes without saying that the spelling of all notes and letters should be absolutely correct. If you are a little dubious on this score—and some of our brightest people can never seem to learn to spell correctly—buy a small inexpensive dictionary and keep it in your desk, to consult whenever you are in doubt.

Whenever you start a new subject, begin a new paragraph. Be careful of your punctuation. Put periods at the end of your sentences—of course beginning each new sentence with a capital—and if the sentences are long or at all involved set off some of the dependent clauses with commas.

The Signature

A woman should sign her letters and notes cordially yours" or "Yours sincerely" when writing to friends and acquaintances; to relatives or very intimate friends she usually signs herself "Yours affectionately" or "Yours with love," or something of that sort. A man is generally "Sincerely yours" or "Faithfully yours." No one should ever sign her name with its title, Mrs. or Miss, unless it is put in brackets before the name, and even this is allowable only in writing to an absolute stranger, who otherwise might be puzzled how to address the reply.

Postage should never be inclosed for reply except in notes or letters that are strictly business communications, and then it must always be put in if a reply is requested. But in all social correspondence it is considered rather an insult to inclose return postage, as the expense is so slight that our friends are apt to resent having it sent to them.

The Proper Address

It is considered very bad form to address a wife by her husband's

title; thus letters to the wife of a general should never be addressed, "Mrs. General Greene," but simply "Mrs. Greene," or "Mrs. James H. Greene." The titles, "General," "Judge", "Doctor," belong exclusively to the husband and not to the wife.

A man, on the other hand, should be addressed by his title if he has one as "Major-General Green," "Dr. Brown," etc., or failing a "handle to his name," as "Mr. George Robinson" or "George Robinson, Esq." In England this latter form is always used except in addressing tradespeople, but in America "Mr." is more often used and is regarded by many as the most sensible title.

Letters of Introduction

One of the most puzzling things to many people is to write letters of introduction. This is a task which falls more often to a man than to a woman, but there come times in the life of almost every woman when she would like to give such letters to intimate friends to present to her acquaintances in distant cities. She should then write a short note something like this:

Sunset, Colorado.

My dear Mrs. Blank:

This will introduce to you Miss Mabel Smith, an intimate friend of mine, who is about to visit New York for the first time and is consequently a stranger in the city. Any attention which you may extend to her will be gratefully appreciated by

Yours very cordially,
Mary Brown.

January 2, 1904.

Letters of introduction are never sealed by the person giving them, and if they are not business letters, but simply friendly letters like the foregoing, are rarely delivered in person, but sealed and sent by the recipient to the man or woman to whom they are addressed, together with the card of the recipient, on which is written her city address. And if you should receive such a letter of introduction from a friend, you must call without delay upon the person introduced to you by letter.

There is another kind of letter which, unfortunately, falls to the lot of most of us to write, and that is a letter of condolence. People with the warmest hearts and the very best intentions in the world often dread inexpressibly a duty of this sort, and, after putting it off until the last possible moment, turn out a stiff and stilted note that inadvertently wounds the sensibilities of those whom it is intended to comfort.

Letters of Condolence

A letter of condolence should be short and simple. In a few heartfelt words let your correspondent know how sorry you are for the great loss he has suffered. Don't harrow already overwrought feelings by too familiar allusions to the deceased. Such a letter should be sent shortly after the funeral has taken place. Letters of condolence are always answered either by the recipient or by some relative or friend who kindly undertakes the task for the grief-stricken one.

SAVINK STEPS IN THE KITCHEN

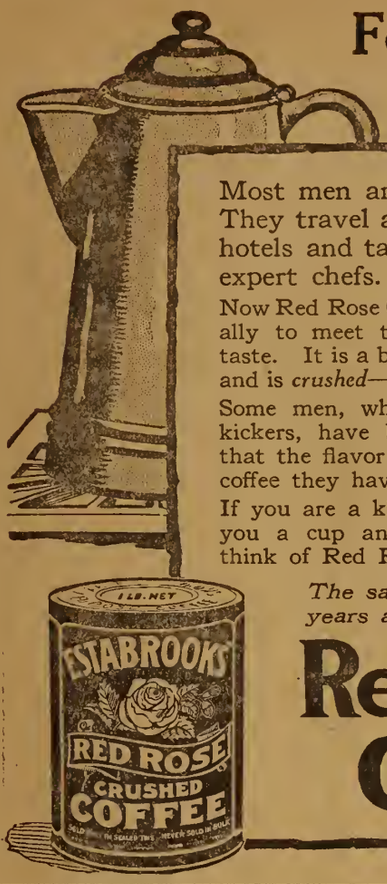
A well-planned kitchen saves time, and every woman is always on the lookout for ways and means of saving time and steps. She needs the extra time that a convenient kitchen will give her. She needs it for rest and recreation quite as much as for the performance of the countless other home and social duties that fall to her lot. A woman worn by much trudging in a mammoth, badly arranged kitchen, wearied by endless carrying of fuel and water, and fatigued by poor light and ventilation cannot expect to do her duty. She may wear herself out in the service of her family, but her duty—giving her best to her family—will not have been performed, because her "best" will have been expended in the hours of toil, and she will be too tired and worn to enjoy the family companionship which makes life worth living.

Think of the saving in steps and strength by even so simple a thing as a wood box beside the kitchen range, instead of running to the outdoor supply each time the fire is replenished. Women who have made their kitchens a convenient workshop may think it isn't possible that any kitchen is unprovided with a near-at-hand fuel supply, but, unfortunately such is the case. And then, just to go a bit further these hot days, there should be an oil or gasoline stove, and, further yet, a fireless cooker, to eliminate the heat of much necessary baking and brewing. Work in a cool kitchen is far different from work in a hot one.

A drain board on one or both sides of the sink is a great help. Here vegetables can be prepared or dishes washed without once having to cross the room. Drawers may be built beneath the sink or a cabinet arranged above to hold soap, scouring powder, brushes, towels, etc. The sink should have rounded corners, because such will not catch the dirt and are easy to keep clean.

There are not two housewives in a dozen who would arrange their cupboards alike, but all will agree that they should be roomy, convenient to both stove and sink, and of a height to suit the worker. All working utensils should be kept near the place where they are most used. Built-in cupboards above and below a work shelf or a kitchen cabinet (and the present-day cabinets are wonders in the completeness of their equipment) serve this very need by having handy pots and pans as well as provisions.

Of course the size of the kitchen depends upon its uses. A small kitchen, well lighted and well ventilated, is much to be desired if it is possible to have it. But even when it is necessary to use a large kitchen the equipment may be concentrated at one side so that there need not be useless tramping over a great space.



For a Kicker's Breakfast!

Most men are critical about coffee. They travel around among the best hotels and taste coffee prepared by expert chefs.

Now Red Rose Coffee was produced especially to meet the critic's keen, educated taste. It is a blend of the richest coffees, and is *crushed*—not ground.

Some men, whom we know to be real kickers, have been kind enough to say that the flavor is equal to that of any coffee they have ever tasted.

If you are a kicker, have your wife make you a cup and then tell us what you think of Red Rose Coffee.

The same price as it was three years ago. 674

THE NEGLECTED RURAL DISTRICT BURYING GROUND

It is quite common to hear criticism of the manner in which the country burying grounds are cared for, and a visit to these places often makes one feel that the criticism is indeed a just one. Neglect is pictured on every hand and even though these grounds are often well situated they are allowed to become a disgrace to the locality in which they are located.

Occasionally we find a cemetery that is well cared for and speaks well for the families having relatives in one of these silent cities, as they are often called. I wish to tell readers something of the plans we took to improve the cemetery in our locality. These grounds were at one time under the care of a religious denomination whose church building stood nearby. As time went on and many changes were made in the residents of the community, the building was no longer used for divine worship. The cemetery was the last resting place of many people who had lived near the church, and many who had lived at a distance. Many fathers and mothers had left the request that they be brought back from other places where they located, and buried in the old cemetery near their childhood home. Their children had laid them away carefully and lovingly and then returned to their distant homes. Thus these graves were left to the care of neighbors or distant relatives yet living in the community.

This cemetery did not suffer from what might be termed wilful neglect, but the nearest relatives being in other districts, and the farmers of the community being busy and expected to look after the graves of their own departed loved ones, did not give the attention needed to keep these graves in good condition. Some, too, who were buried there had no relatives anywhere to care for their graves. Many old-style, high-top grave markers were toppling over and some were already lying on the ground. Grass and weeds so completely covered the grounds that the use of a lawn mower was impossible.

There seemed to be only one solution of the problem and that was to place the care of these grounds upon a business basis. With this end in view, a meeting was called, a committee appointed and a board of trustees chosen. The board of trustees consisted of five members, and privilege given for the choosing of a new member as one trustee would go out of office or move away. This board consisted of public-spirited men who were willing to give some of their time gratis to the work of improving the old cemetery. The heavy labor, of course, was paid for, but much time was donated by these generous men. The first act of the board was to procure the names of all people interested in the work and those having relatives buried there. These people were solicited to give toward a fund that was to be put on interest and the income of this used in keeping up the cemetery. The fund itself was not to be used, only the income from it. No lots were sold, but it was understood that donations were welcomed, and by giving a donation to this fund, a lot would be reserved for the donor. All people solicited were favorable to this arrangement and many were very liberal in their donations. Those living at a distance were very willing to enter into a plan that would insure the care of graves of their relatives, and of their own graves when they were laid in the same resting place.

The cemetery was plotted and a careful record made of all lots, new fences were put up, the graves all levelled and low places filled, so that the grass could be mowed with a lawn mower. A man was hired to care for the cemetery, mow the grass and trim around trees and markers. The grass was mowed once each week. An ordinance was passed forbidding the planting of shrubs or flowers that would interfere with the mower's work. Cut flowers were allowable. In a short time we had a beautifully kept cemetery, plain but neat in every detail.

After all this work was done, a tent was purchased for use over the open grave during the time of burial in cold and rainy weather. This was much appreciated by those who buried their friends in this cemetery.

It is to be hoped that other communities take hold of similar work and help to remove the criticism that has been heaped upon the farmers who prmit a place to exist in their neighborhood that is a testimony of carelessness and neglect. The graves of our departed ones should be well cared for and kept in a neat, yet plain condition during the entire year.—Mrs. E. F. M.

With an attendance of 920,000 at the Canadian National Exhibition, and some 175,000 at Quebec, and judging from the interest which a large percentage of these visitors evinced in the Government Railways attractive exhibits, they may reasonably expect to enlarge their ever increasing clientele.

At Toronto an immense map of Canada from Winnipeg East to the Atlantic Coast, some sixty feet long by fifteen feet high, was erected. The route of the Government Railways was outlined in electrically lighted red globes, and in order to demonstrate the run of the principal trains a moving shadow by an ingenious electrical contrivance was arranged. For instance, starting from Quebec an illuminated sign flashed the "National Atlantic," and immediately the shadow commenced its run to Quebec, connecting at Cochrane with the line to Toronto, the names of the principal stations flashing as approached. Nearing Quebec another sign announced the Ocean Limited had left Montreal. The two lines connected at Quebec, and the Ocean Limited continued its journey by the shores of the St. Lawrence and thence to Moncton, Halifax and the Sydneys. On the return journey a similar operation was performed.

An announcement on the map stated that over 500,000 of our soldier lads had travelled this route without mishap, a feature in railway operation any transportation corporation might point to with pride—as indeed did a huge statue of Jack Canuck, emblematic of the fact that it was his own railway that had made such a record.

An architectural illuminated model of the new Union Station which is to be erected in connection with the vast terminals now under construction at Halifax was also displayed together with oil paintings showing the terminals as they will appear when completed.

The Quebec exhibit was on somewhat similar lines, and so impressed the Exhibition authorities that a gold medal was awarded for artistic taste in railway advertisements.

At both Exhibitions a large number of the railways publications were distributed.

A druggist can obtain an imitation of MINARD'S LINIMENT from a Toronto house at a very low price, and have it labeled his own product.

This greasy imitation is the poorest one we have yet seen of the many that every Tom, Dick and Harry has tried to introduce.

Ask for MINARD'S and you will get it.

WINTER TOURS

If you are contemplating a tour this season to California, New Orleans, Florida, or any of the numerous Southern Resorts, write J. H. Corcoran, T. P. A., G. T. R., Wyse Building, Moncton, for full information, rates, reservations, etc. Special fares are now in effect via Grand Trunk Railway System—stop over privileges are allowed.

Nothing to Brag Of

"Her ancestors came over in the Mayflower."

"Yes. Everybody travelled in the steerage then."

She—Why don't you call me "dear" nowadays?

He—And have Mr. Hoover warn me to find a substitute?

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

Mrs. M. Summers
BOX 309 WINDSOR, Ontario

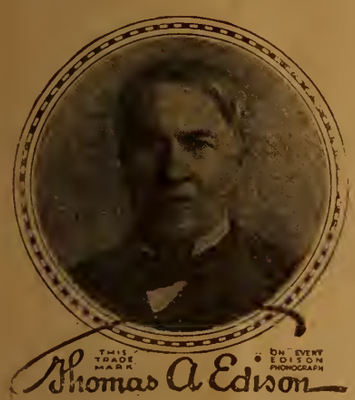
Try EDISON'S 1918 AMBEROLA in Your Home

NO matter how delightful your home may now be, Mr. Edison's New Diamond Amberola could not fail to make it more so. A Diamond Amberola in your living room would make it the brighest and cheeriest spot in the world for you. It would become a hallowed place where your family and friends would gather together and enjoy with you the gems of the world of music—heart-songs, ballads, hymns, opera, concert, musical comedy, vaudeville—no end of entertainment.

We could tell you that the Amberola reproduces songs so naturally that, when you turn your back and close your eyes, it is difficult to believe that the living artists are not actually in the room. We could write whole pages in an effort to convince you that the New Edison Diamond Amberola is a musical instrument indispensable in your home, but one note of the voice of Anna Case singing "Annie Laurie," or one ripple of music from the bow of Albert Spalding playing "My Old Kentucky Home," would convince you as no printed words ever could.

We could tell you that the New Edison Diamond Amberola has a GENUINE DIAMOND REPRODUCER (no needles to change.) We could tell you that Edison Blue Amberol Records are almost unbreakable and unwearable. We could tell you many other wonderful things about the New Edison Diamond Amberola and Edison Blue Amberol Records, but the Amberola itself can tell you in its own music language far better than we can.

HEAR MR. EDISON'S AMBEROLA BEFORE YOU PURCHASE ANY PHONOGRAPH OR TALKING MACHINE, WHATEVER NAME IT MIGHT HAVE. And when you do hear the Amberola, hear it in your own home right where you would expect to use it after you bought it. Just give it a few days' trial and it will sing and play itself into your heart and your life so that you will never want to part with it even at many times its cost.



SPECIAL FREE TRIAL OFFER

Now, about that tree trial? Find in the list below the name of the dealer nearest you. Fill in the coupon at the bottom of this page and sign your name and address on the margin. The dealer will send you the beautiful Amberola Book from which you may select the instrument you prefer. He will also send you the catalog of Blue Amberol Records. Select any 12 records. The dealer will send you the Amerola and records, which you may keep for three days. After three days you may purchase the Amberola and records for cash or on terms which will be arranged by the dealer, or you may notify the dealer that you do not care to purchase and he will take them back without the triai costing you one cent. No red tape! No expense or obligation on your part! Just an out-and-out FREE trial.

No doubt many times you have thought that you would buy, or, try a phonograph "some day." Send the coupon NOW. Make TO-DAY YOUR "SOME DAY."

Write for our beautiful Amberola Book, "A Master Product of a Master Mind." It's FREE.

WHAT THE AMBEROLA GIVES YOU

With the Edison Diamond Amberola you may have any kind of music at any time and any Place. Think what a priceless possession this is!

Mr. Edison has so perfected the art of phonographic recording that every sound-wave, from the crashing thunder of great military bands to the most delicate wisp of sound from the highest-toned violin, is caught by his recording instruments and reproduced on Blue Amberola Records. His method of recording is a secret with Mr. Edison and his most trvsted associates. That is why no record but an Edison record has all the natural warmth, richness and feeling of the living artist. There is no thin, metallic twang such as you hear from talking machines—nothing but smooth, round, rich and mellow melody. You actually would be astounded to think that anything but a human being could produce such music.

Mr. Edison, placing quality before all else, selects his artists solely on merit. He has the choice of the best vocalists and instrumentalists of the world make records for him. That is why, on Edison Blue Amerol Records, you hear the foremost singers, instrumentalists, bands, orchestras, etc., of the day. As iilustrating what you may have when you own an Amberola we have selected at random the following Blue Amberol Records from the extensive Blue Amberol catalog.

Why Canada Must Give Credit to Great Britain

Great Britain is the Canadian farmer's best market to-day. Not only must the people of Britain be fed, but also the millions of fighting men, among whom are our own boys.

But Great Britain must buy all her supplies on credit. She can no longer send her money out of Great Britain. She must use her credit abroad and buy where she can get credit.

Canada in her own interest must give credit to Great Britain in order that Great Britain may be enabled to continue to purchase Canada's agricultural and other products.

In other words Canada must lend Great Britain the cash with which to pay Canadian farmers and other producers.

Then where does Canada get the cash? Outside financial markets are closed. Canada will get this cash by selling Canada's Victory Bonds.

So the Canadian farmer has a three-fold reason for buying Canada's Victory Bonds.

It is good business for him, because it keeps open his market.

It is patriotic because it enables him to help in maintaining production in Canada through which our fighting men will be supplied with Canadian produce.

And lastly because the investment is absolutely safe and the interest rate is most attractive.

Get ready to buy in November,
Canada's Victory Bonds

Issued by Canada's Victory Loan Committee
in co-operation with the Minister of Finance
of the Dominion of Canada.

VALUE OF FOODS TO THE BODY

Just how much food the human body does need is a complicated problem to which in recent years scientists have been devoting much attention. Food is the source from which the body derives both its energy, or fuel, and the substance it uses to build and replace wornout tissues. It also provides small amounts of recently discovered substances needed to regualte growth and other bodily functions. As a unit for measuring the energy supplied, scientists have adopted what is known as the calorie, and it is estimated that for a full-grown man engaged in moderate physical work, 3000 calories a day are needed. Of these, from 300 to 400 should be supplied in the form of protein, the chief substance utilized by the body in tissue building. There should also be some fruits and vegetables which supply the mineral matters needed for building tissues and help in various ways to keep the body machinery in good working order; also fat and starches and sugars, which are valuable sources of energy. The energy supplied by the foods, as a whole, is consumed by the body in running itself and performing its daily work.

The number of calories and the amounts of nutrients contained in stated quantities of different kinds of food have been worked out by scientists and afford a basis for comparing the nutritive value of various dishes. The matter is so complicated that the ordinary housewife probably has neither the time nor the inclination to make a mathematical calculation of the nourishment her meals afford. It will, however, help her to know that by observing a few fundamental principles she can alter her bills of fare to suit changing conditions at home or in the market without any risk of underfeeding the family. First among these is the fact that an adequate diet should contain articles from each of the five groups into which the common food materials may be divided. These are:

1. Vegetables and fruits, which supply acids and other substances that the body needs to keep it in proper working order, as well as some building materials and energy.
2. Meats, fish, eggs, milk, legumes, etc., in which the proportion of protein to other substances is high in comparison with the other groups.
3. Starchy foods, like potatoes, rice, flour and other grain products, etc., which furnish much energy and some protein and mineral matters.
4. Foods rich in sugar, an excellent source of body fuel, the pleasant flavor of which makes the diet more attractive.
5. Fats, like butter, bacon, cream, lard, etc., which are valuable sources of energy.

No one of the groups can profitably be omitted altogether. It is, nevertheless, possible to avoid from a nutritive point of view a useless waste of money by selecting, first, the cheapest articles in each group; and, second, by substituting to a certain extent articles from a cheaper group of those from a more expensive. In particular, the grain foods in group 3 may be used more extensively than is common in many households, and the use of the higher-priced ones in group 2 may be correspondingly decreased. The grains furnish protein as well as energy, and in a cheaper form than meat. By combining them with a little meat, the meat flavor is secured and a dish as nutritive but much less expensive than meat alone obtained. This does not mean that all animal foods or even all meats should be shut out of the diet entirely. As far as can be judged, in the light of our present knowledge, the body is most likely to keep in health if it obtains its protein from a variety of sources, including milk (especially in the case of children), eggs, meat, etc. Similarly, dried fruits contain not only the characteristic properties of foods in group 1, but sugar as well, and a liberal use of them will provide in an economical form much of the sugar which the palate craves.

The housewife, too, who understands these and similar facts in regard to the composition and uses of food will be able to free herself from many existing prejudices. Skim milk, for instance, is regarded as unfit for human use. As a matter of fact, it contains practically all of the constituents of whole milk, except the fat taken off in the cream. On farms it is frequently fed to live stock, but in many cases it might be more economical to use in the household. If it is considered too thin for drinking, it may be used in cooking, as in making soups, mixing bread, or cooking cereals.

HOUSEHOLD HINTS

When you wish to take up threads and ravelings with your sweeper dampen the brush and the task will be an easy one.

Stale walnut meats are improved by soaking in milk and water for eight hours; dry and they will be as fresh as new.

When covering jelly jars with wax, melt wax in a small teapot; by pouring it fro mthe spout the jars are quickly and neatly covered, and the wax stays melted for a longer length of time.

Before washing your sweater, sew up the buttonholes. This will prevent them from stretching open, as they invariably do in the process of cleaning.

The Pathé Sapphire Ball

versus

The Old Scratchy Needle

WHO to-day wants a talking machine equipped with a digging, scratchy needle that wears out your best records and necessitates the nuisance of ever changing needles. The Pathé genuine smooth polished Sapphire Ball never wears out, never requires changing. It reproduces the music in richer, more natural tones—for it completely fills the grooves of the record and gathers the music from a greater surface of contact, so that it does not lose the slightest shading or tonal effect.

Thus does this Pathé Sapphire Ball give you better music and more enjoyment from your instrument, as well as ensures longer life to your records Here's the Pathé guarantee :

"Every Pathé Record is guaranteed to play at least one thousand times without impairment to the unexcelled beauty of tone"

Pathephone

If you are planning to buy a phonograph, you should certainly hear the Pathé. You will be enchanted by its wonderful tone. If you already have a phonograph, it can be easily equipped to play Pathé Records—or — better still — any Pathé agent will make you a liberal allowance for it in exchange for one of the new Pathe Period Designs

Send for the PATHÉ CATALOGUE. It contains scientific explanation of exclusive Pathé methods of recording and reproducing sound, together with interesting chats on Period Furniture. Will be mailed free upon request.

CHOP FEEDS

(Continued from page 71

coarse and fibrous indicating that they had been largely made from light oats or contained a heavy admixture of oat hulls, mill waste and other worthelss offal. Some of them contained a number of weed seeds, fragments of straw, etc. There is no wonder that stock refused them. Indeed it is well nigh impossible to imagine how they could be used profitably, if purchased at any price.

Ground or crushed oats from good quality grain makes a nutritious feed —though for young pigs and calves the hulls should ve sifted out. While not a high-protein concentrate it possesses many excellent qualities as a basis of the meal portion of the ration. Of all the cereals, oats are the most readily and successfully grown throughout Canada, and there is no reason why the progressive farmer with foresight should not be independent of these purchased chop feeds. With a grain grinding mill on the farm, there should be little necessity to buy chop.

There are many excellent feeds on the market, the price of which is more or less in accord with their nutritive value. These should be bought, rather than chop-feeds, to supplement the home grown feeds and fodders. At the best, chop is but a low-grade feed. If necessity occasions the purchase of the chop, careful examination of the proffered feed is important; unless finely ground those containisg an exeess of hull can be readily distinguished by experienced farmer.

GOOD ADVICE

We all read with much interest and doubt about the wonderful things the city garden were going to do. We farmers of course were doubtful of the result. At the same time, we did not take any chances, and planted less vegetables. The consequence is, the great cry now is for vegetables. I advise farmers that have such vegetables, to get some fine sand now, before the rains come on, and get boxes and barrels ready to put such vegetables in; fill them full of vegetables when gathered, then pour in sand and shake down. In this way they will keep hard indefinitely and you can set your own price on them. If you have cabbages, strip oc loose leaves, roll in two thicknesses of newspaper and put in barrels if you have them; if not, put in bags and hang to ceiling of cellar. They will keep often into warm weather of next season.

If you have squashes or pumpkins, gather carefully so as not to dent; don't put in cellar; put in attic or dry room, not colder than 40. Do not allow them to touch each other. Squashes will keep way beyond next season, and pumpkins often into April or May. The main point is not to allow them to get too cold, or allow moisture to touch them. If they touch each other, they sweat and rot, or if the ooof leaks, it will rot them. The above is by actual experience, not theory. Some extra watery squash or pumpkins will not last as long as others. When they spot, I cut open and feed to hens. It is the best winter green food.—Clarence G. Penney in Maine Farmer.

ATTRACTIVENESS COUNTS

Selecting fruits and vegetables for exhibition at local, county, or state fairs has in many cases developed into the habit of selecting the largest specimens available. Size is always a desirable characteristic but the use of over-grown specimens often results in the sacrifice of other characteristics which are of equal or greater value.

In the search for size, good color and shape, freedom from blemishes and uniformity in the various specimens are often entirely overlooked. To show the relative value of these points, the score card for apples used by the University of Missouri College of Agriculture is given: Size, 15 points; form, 15; color, 20; uniformity, 20; freedom from blemish, 30; total, 100.

Size.—The most acceptable commercial size is somewhat above the average size for the variety in regions where it is well grown.

Form.—In all cases this refers to the normal gype of the variety, region of growth considered.

Color.—In red, blushed or striped pome fruits, high, celar color is desirable. A blush on a green or uncolored variety is considered neither favorably or otherwise. The highest color is most acceptable in stone and vine fruits.

Uniformity—This refers to uniformity in size, form and color. Uncolored, mis-shapen specimens or specimens of irregular size have no place in a plate of show fruit.

Freedom from b l e m i s h.—This means freedom from every kind of blemish, resulting from insect injury mechanical injury, disease or any other cause. Score cards for other fruits and for vegetables will necessarily differ somewhat from the foregoing but in every case, size will be only one of the several points emphasized. Therefore, in order to have exhibits which will carry away the ribbon it is necessary to select the individual specimens, well shaped and colored, of a uniform size above medium for the variety and free from all signs of injury or disease.

Meat Shortage Critical

Quick Action Needed

"Since the War the live stock herds in Europe have decreased by 115,000,000 head. No one can say to what extent the breach of the Italian front was made possible by food shortage. France requires increased supplies unless the women and children are to suffer from hunger. The Allies look to Canada and the United States to save the situation which to-day is grave. We must and will save it. The demand for meat and the fact of depletion of European herds is a guarantee of high prices. Steps have been taken to assure fair treatment to the producers.'

W. J. HANNA,
Food Controller of Canada.

Mr. Hanna is working in co-operation with the Food Controllers of Great Britain and the United States. He, more than any other man in Canada, knows the needs of the Allies. His statement shows the seriousness of the meat situation. The question is: How can the shortage best be met?

The speediest way to relieve the critical situation is to greatly increase the production of hogs.

Swine, on account of being prolific and growing to marketable size rapidly, will produce meat more quickly than any other kind of livestock, because 1,500 pounds of dressed meat is a moderate estimate of what can be produced from one sow in one year. As it is a huge quantity of meat that is needed, and needed speedily, the Allies look to the hog raisers of Canada and the United States to meet the situation.

The Dominion Department of Agriculture and the Agricultural Departments of the Provincial Governments are co-operating to secure the interest and action of the Canadian hog raisers. The Food Controller states that *steps have been taken to assure fair treatment to the producers.* This will be explained in a further advertisement. The point the Government wants to impress to-day is to

Save the Young Sows

Great Britain has almost doubled her imports of bacon and hams since the war, importing over one billion pounds since last year. There has been no increase in the production of Canadian hogs to meet this situation. The killings in Denmark have decreased 40%. The receipts of hogs at Stock Yards in the United States for the eight months ending August 31st, 1917, show a decrease of 2,765,006 compared with the same period in 1916, while the month of September, 1917 (the latest month for which figures are available) shows the great decrease of 859,830 compared with September of 1916. These figures emphasize the pressing need for a great increase in the production of hogs and indicate a safe and profitable market.

The enormous consumption of the Allied Armies is sufficient to steady and maintain the bacon market at a high level. The British Army ration calls for one-quarter of a pound of bacon per man per day. Multiply this by millions of fighters and some idea is given of the need for increased production.

The fighters, and the women and children of Britain, France and Italy urgently need more meat. Canada can help supply it. Save the young sows.

The best silk linings are used. Coat is 45 inches long. Price to you wherever you live $385

A Fur Set For Your Child This Winter

We have an imitation Ermine set (No. 1949 in the catalog) which will delight the heart of your little girl. It is a pretty little set made of White Coney. Well made and of good quality. Take advantage of our mail order service and get this child's set for..... $6.50

Bargains Like These On Every Page of Our Big Catalogue

Each of the offers in this advertisement is a feature from our wonderful FREE style book. This splendid book is the pulse of the fashion world. It contains illustrations of hundreds of the most interesting furs and fur styles. It also quotes astonishingly low prices on the exquisite coats and pieces described. You will be delighted with the many beautiful furs illustrated in the Fur Guide. No person can make a satisfactory choice in furs without this guide. You need a copy. Send for one today—it costs nothing to you. We will mail a copy by return post.

Natural Red Fox Muff

Red Fox is one of the few furs that have been continuously admired season by season. We have a number of fur pieces in this beautiful fur, a notable example of which is featured here—a muff at the remarkable price of $27.50. This muff is made in the new melon shape. The choicest of pelts have been used. Trimmings of a head, and a large natural tail make it very charming. The muff is lined with the finest of silk and has an eiderdown bed. No. 59. Price.. $27.50

Natural Red Fox Neckpiece

If you are in search of a Neckpiece in a fur which can be worn appropriately with any coat, we would suggest a Red Fox Neckpiece. A desirable one is our No. 339. Our designers and operators have exercised their skill to good advantage in producing this neckpiece. It is in the full animal style. A head, tail and paws are used for trimmings. The neckpiece is made with good quality natural Canadian Red Fox pelts. The price is as attractive as the quality. In whatever part of Canada you live you can get it by sending us $22

THE CARE AND APPLICATION OF MANURE

The care and application of manure has always been an important part of farm work, and since the acute demand for foodstuffs has developed, should be given careful consideration.

Most farmers know, or should know, that the day manure is voided from an animal, it is of its greatest value, and every day it is kept out of the soil, its value decreases. The percentage of such deterioration will depend on the method we adopt to conserve it.

As the greater quantity of stable manure is made in winter, a simple method of conserving it or keeping it from losing any of its fertilizing value, is to let it freeze. Perishable goods are always now kept in cold storage, and it is an easy matter to spread each days manure thin enough to have it freeze hard, the entire pile may then be kept frozen until the time a spreader can start in the spring.

Recognizing the great importance of stable manure, not alone in the quantity of plant food and humus it may contain, but also in the beneficial effect the bacteria content has in assisting to liberate rich soil fertility and in promoting a growth of clover so necessary as a stock food, as a promoter of humus, and as a complete renovator of depleted soils. I have always endeavoured to try and learn through careful experiment, just what methods was best suited to my farm and crop rotation. Concreto floors are warmest, most sanitary, most durable and most economical in every way, and are in general use on all modern stock farms, and manure hauled daily in winter from such a floor, spread in convenient piles on the field, can be best applied with a manure spreader in the spring.

Knowing that many successful farmers spread directly from the team in winter on the field, and that this practice was advocated by directors of our Experimental Farms, I continued this method for several seasons, noting carefully the results of spring dressing in comparison, and was forced to abandon the former method as wasting entirely to much plant food. While it had the advantage of lessening spring work, the saving in labor in my opinion, did not nearly make up for the loss from loading, even though my farm was nearly flat.

We always kept sufficient stock to consume all crops grown on the farm, and until recent years all available manure was used to grow roots and corn. This was applied in the early spring for the former, on summer fallowed sod, and for the latter on a pasture or other green sward. When the quantity of manure increased (as it will continually following this line of farming), I purchased 100 acres of poor run out land, not fertile enough nor convenient to grow roots, and corn on. My practice has been, on an old pasture, to plough early in September, cultivate thoroughly and grow oats first year, the second year we manure and seed with grain again to clover, and for a number of years I have been trying several methods of applying manure. 1st, by dressing the oat stubble after harvest, (with manure made in summer), and plowing under before winter. 2nd, applying in the spring both before and after the oats were up, on land plowed the fall before and well cultivated in the spring. 3rd, applying the manure in early spring on the stubble and plowing lightly. 4th, applying the manure in the spring just before seeding on fall ploughed stubble and discing it. In every case we gave the land from ten to twelve spreader loads of manure. This dressing would grow a fair oat crop and a varying clover catch. So far I have had decidedly the best patches of clover from plowing the manure down.

I have tried all these methods several times, as I was under the impression that top dressing would give us the best results, but in no one instance, either in the fall or early spring, in fact, the difference in favour of the latter has been so marked that I have abandoned top dressing, except under occasions when we failed to get time to do it before. The difference in the oat crops was not so marked, but the growth was at least as strong on the plower under lot as on top dressed and much more uniform.

I think the reason the clover grows so much better on the former, is that being buried and thoroughly incorporated with the soil, it is made available for the plants to use much more readily than that lying on top, and top dressing actually smothers out quite a lot of clover.

This is a most important subject and worthy of consideration and careful experiment by every Maritime farmer, and while I have given the results of my experiments and have tried to learn what I can from the work of others, I realize that the question is open for discussion, and many men differ from me, especially in the system of spreading directly from the sleigh or wagon in winter. This system saves some labor, in that the manure is only loaded once and the work can be done in winter, but the spreader makes such a much better job, that I think it largely makes up for this gain, and if we are ready to take advantage of the season, there is usually a time in the early spring when a spreader can be started before we can work much on the land.

W. M. LEA.

MORE ABOUT SHEEP

The Department Can Supply You With Any Number Required

The Livestock Division of the Department of Agriculture is prepared to assist any farmer in the Province to secure first class grade ewe lambs, pure bred rams, or pure bred ewes. We want to do so and have the stock available. Why not swing in line with other farmers and grow more sheep? Just stop and consider what you are going to do with the surplus hay you will have to carry over this winter. There has been a big hay crop and prices will range low. Why not winter 15 or 20 grade ewes and a pure bred ram ,rather than a mow of hay. The sheep will prove the more profitabel.

How to Secure Sheep

The Department of Agriculture can secure any number of first class high grade ewe lambs. Part of these will be selected in New Brunswick and part will be secured from P. E. I. sources. There is no limit to the supply. Then we can fill all orders for pure bred flock headers and pure bred ewes. Some of these will come from local breeders and after this source is exhausted, an importation will be made from the Province of Quebec.

The price for grade ewes will range from $10—$15; for pure bred ram lambs and ewes $20—$25. As a guarantee of good faith the Department of Agriculture requires that with each order the purchaser deposit a sum of money sufficient to cover 50% of the purchase price; the balance to be paid when the sheep land in Fredericton. If you are interested in this proposition write the Livestock Division of the Department of Agriculture, Fredericton, N. B.

"Yes, sir, I belongs to de army of de unemployed."

"I can give you a week's work."

"Would you have me desert the army?"

"Great Scott! You're entitled to a furlough now and then, aren't you?"

GETTING ALONG WITHOUT HIM

Most farmers are up against it for help, and perhaps reader, you are too. It's hard work to get along without the man or the boy sometimes. You should have a BT Manure Carrier. It will save you half-an-hour or an hour a day, and cut out the hardest part of the chores. It takes out all the manure from the gutters in one load, or two loads if you have a lot of cows. It keeps the manure 60 feet away from the barn just as easy as throwing it out the window for it runs on a level overhead track as far from the barn as you please.

Push it out by a clean handwheel. Dump quickly by pulling trip-latch. Bucket dumps both ways. High ends prevent the manure slopping over on the way from gutter to pile.

BT MANURE CARRIER WILL HELP YOU

Note that the bucket winds up close to the track so you can easily dump in wagon, sleigh or spreader or on the pile when it is high.

You have greater need for a BT Manure Carrier this Fall than you ever had. Buy it now at the beginning of the winter when your cows are just going in. Let it help you all winter long and all spring till you put your cows on pasture again. By that time you will find that it has nearly paid for itself.

Get the booklet right away. It gives details about the BT Carrier. Jack Frost will soon be here so you will have to hurry.

Food Controller Assures Protection For Hog Producers

There is a shortage of 32,425,000 hogs in Europe. Britain, France and Italy urgently need all the hog products that the United States and Canada can possibly produce. The Dominion Government and the Provincial Governments are co-operating to greatly increase the production of hogs in Canada. In connection with this undertaking, Hon. W. J. Hanna, the Food Controller for Canada, made the following statement to a representative gathering of packers and produce men:

"The hog producer will want to know at the very outset that there is assured to him as grower *his fair share of the price* paid by the consumer.

"Between him and the consumer is the packer and the distributor. Both he and the consumer have the right to know that the charge for packing and distributing is in relation to the cost of these services.

"In the case of flour mills, we have worked out what is practically Government control in the form of license. The only profit the miller will be allowed is 25c. per barrel on the flour. The bran and shorts will be sold to the farmers at actual cost. We are adopting a plan for control in connection with wholesale fruit and vegetable men. In the case of packing houses and cold storage plants it *must mean practical and effective Government control.*"

CONFIDENCE JUSTIFIED

The assurance to the producer of a fair share of the price paid by the consumer, considered in association with the ever increasing demand of the Allies for meat, justifies confidence in the future of the swine industry.

There is a world shortage of meat. In Europe the situation is so critical that it is now one of the vital factors in deciding the outcome of the war. And hogs, on account of their prolificacy and early maturity, provide the only way to relieve the emergency.

Some idea of the enormous increase in the consumption of bacon and hams overseas since the beginning of the war is given by a statement of the British Imports:—

In 1913 they were.....	638,000,000 lbs.
In 1914 they were.....	664,000,000 lbs.
In 1915 they were.....	896,000,000 lbs.
In 1916 they were.....	1,006,000,000 lbs.

There has been no increase in the world's hog production to meet this enormous increase in consumption. Quick action by the Canadian producer is needed. The number of hogs slaughtered at Inspected Establishments in Canada in September, 1917, show a decrease of nearly 27% compared with September, 1916. Despatches from Copenhagen state that the total prohibition of pork exports is anticipated in order to insure an adequate supply of meats and fats to the Danish population.

In view of the urgency of the situation every person who can raise hogs should seriously consider the possibility of raising at least one or two extra litters. There is an individual responsibility. Young sows which are slaughtered now only produce about 150 lbs. of meat per sow, whereas each of these young sows through her progeny could produce, at a moderate estimate, 1,500 lbs. of meat within a twelve-month period.

SAVE THE YOUNG SOWS

Every soldier in the British Army requires ¼ pound of bacon per day in order to maintain the highest bodily efficiency. Multiply this ¼ pound of bacon by the millions in the Allied Armies and some idea is secured of the urgent need of increased hog production for military purposes alone.

SMALL COLD STORAGES

By J. A. Ruddick and Jos. Burgess

Large quantities of perishable food products are wasted every year in Canada for lack of simple cooling facilities, which may be provided at comparatively small cost. If farm homes, country stores, and hotels, butcher shops, etc., were more generally provided for the summer months with an adequate supply of ice, stored in a manner convenient for use, there would not only be a great saving of food supplies, but much food now consumed in a more or less deteriorated condition would be more palatable and more wholesome. The housewife, provided with such facilities, would also be able to buy in larger quantities and would have no difficulty in keeping a variety of perishable foods always on hand. A more general use of ice in the country would not only add much to the comfort of the people generally but would result in great saving of labour in many homes.

With regard to the ice which is stored, much of it is wasted, and the full benefit is not always derived from its use, owing to the faulty method of storing, and lack of facilities for utilizing its cooling power to best advantage. Many of the so-called "coolers" "ice-boxes," "refrigerators," etc., in use at present, are wasteful of ice, inefficient in the matter of cooling, and frequently very unsanitary. They have in many cases been constructed without regard to the most elementary principles of refrigeration, air circulation or sanitary conditions.

The plans, which are published herewith, have been thoroughly tried, and will, if carefully followed, give a dry storage at as low a temperature as it is practicable to obtain with the use of ice only.

It must be clearly understood that these plans are not intended to provide 'cold storage' as that term is generally understood. In a regular cold-storage warehouse various temperatures are maintained in the different rooms, according to the class of goods stored therein. For butter, meats, fish, etc., a temperature as low as 10°F. to zero is required. With the use of ice alone a temperature below 38° to 40° F. cannot be obtained. Such temperatures are useful only for keeping the more highly perishable foods in a fresh condition for a short time, say from a few days to two or three weens, depending on the natural keeping limit of the various products.

The Ordinary Storage of Ice

The mere preservation of a few blocks of ice is a simple matter. Any unoccupied corner of an outbuilding or shed can be utilized. A rough framework of boards enclosing the necessary space and affording protection from the weather is all that is required. About 40 cubic feet should be allowed for every ton of ice to be stored. There should be no floor in this kind of an icehouse. If the soil is light and porous no special provision need be made for drainage. If it is impervious clay it will be better to provide some drainage. The earth should be covered to a depth of 6 to 12 inches with small stone, coarse gravel or cinders. About one foot of sawdust or planing-mill shavings should be placed under the ice. A space of at least one foot should be left between the ice and walls, to be filled with sawdust or planing-mill shavings, the latter preferred. Cover the ice with one foot of the same material.

Improved Icehouses and Refrigerators

The plans shown and described in this article are intended for those who may have to erect special icehouses or who may desire to provide more ronvenient and permanent fadilities than the ordinary ice supply affords.

Plan No. 1 is intended primarily for the use of patrons of cheese factories, and is really a combined covered milk stand, milk cooling tank, and ordinary icehouse.

Plan No. 2 is an ordinary icehouse with dairy or milk room.

Plan No. 3 is an ordinary icehouse with refrigerator and milk room. The refrigerator in this plan is arranged on the same principle as an ordinary house refrigerator, only much larger and with a correspondingly large space for ice.

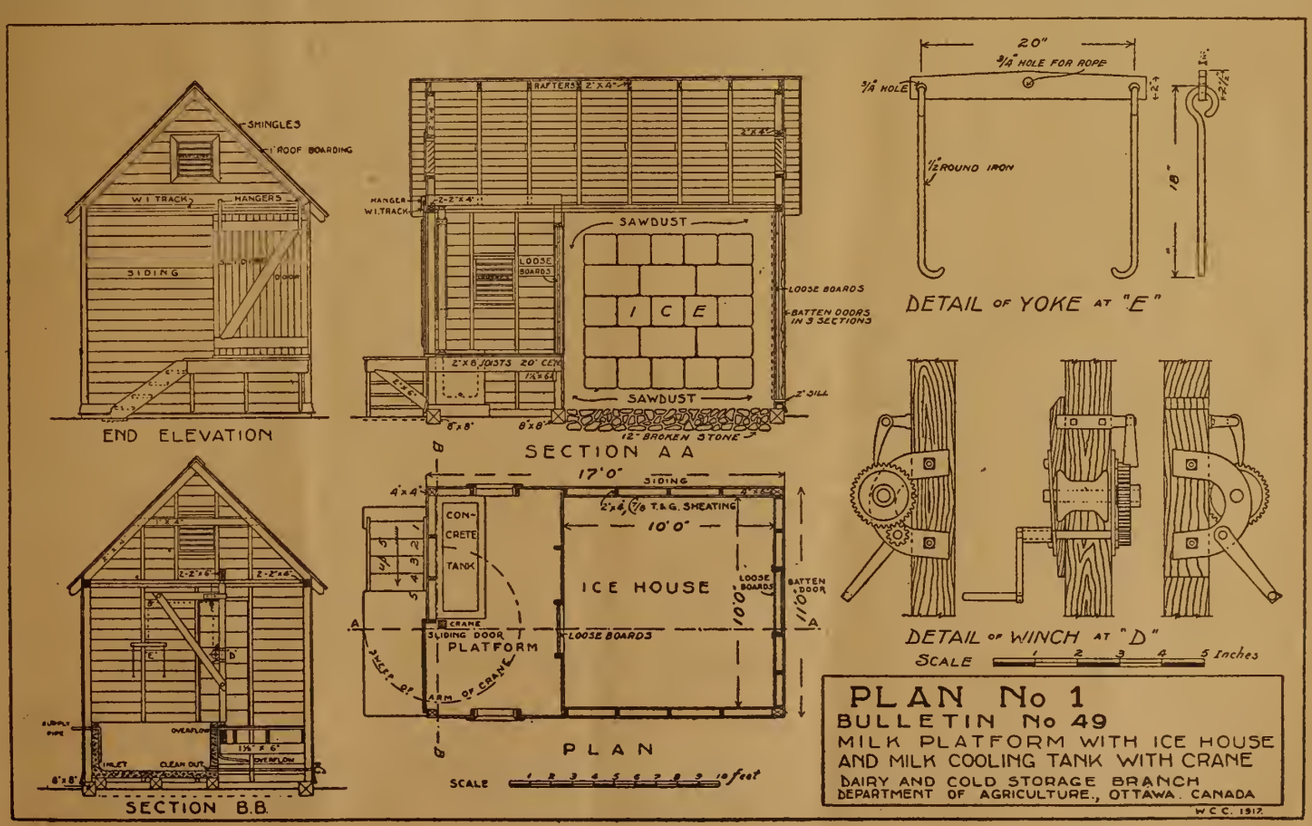
Plan No. 4 is a farm dairy, with insulated icehouse and refrigerator.

Plan No. 5 is an insulated icehouse and refrigerator, and is especially adapted for a large country house.

The design of plans 4 and 5 follows what is known as the automatic or lirculation system. It provides for a permanent insulation of the walls, floor and ceiling of the ice-chamber, which takes the place of the usual covering of sawdust or other packing material. In plans 1, 2 and 3 the insulation or covering of sawdust, shavings, or other material must be renewed every time the icehouse is filled.

In cases where convenience of operation and general efficiency are given first consideration, as against initial cost, we strongly recommend plan 4 for a dairy and cold storage combined, and plan 5 for a small cold storage suitable for country homes, institutions, hotels, etc. The first cost is greater, owing to the extra insulation, but the convenience and satisfaction which the circulation system gives, more than make up for the extra cost.

The advantages and disadvantages of the two systems are obvious. Plans, 1, 2, and 3 provide for the cheapest construction, but the annual renewal of the insulation or covering material, and the labour of cleaning the ice, and filling the ice-boxes or refrigerators from time to time, are very important considerations. Plans 4 and 5 have the very decided advantage of being automatic in op-



eration, thus requiring no attention throughout the season. The ice not being covered permits of a circulation of air between the ice-chamber and refrigerator for cooling purposes. The opening at the bottom of the partition between the ice-chamber and refrigerator allows the cold air to flow into the refrigerator while the warm air returns to the ice-chamber through a similar opening at the top of the partition.

These openings should not be over 6 by 18 inches, and both should be fitted with sliding covers to regulate the circulation of the air, or to shut it off entirely when not required. The circulation system also has the advantage of giving dry storage, because the moisture in the air which circulates is condensed on the cold surface of the ice.

Section BB. plan 4, and section AA. plan 5 shows the refrigerator with a lower ceiling than the ice-chamber. The object of this is simply to reduce the air space which has to be cooled. the ceiling of the refrigerator need not be more than 7 feet high. Any space in excess of that height would be useless for storage purposes.

SPECIFICATION FOR PLAN No. 1

Ice House with Milk Platform, Cooling Tank and Crane

Construction.—Level off the earth and bed 8-inch by 8-inch sills, halve them at the corners and bolt them together with two ⅜-inch bolts to each joint.

Set up 4-inch by 4-inch by 6-inch corner posts housed into sills, spiked and braced. Set up 2-inch by 4-inch filling in studs and lay 2-inch by 4-inch double plate with joints staggered. Studs may be set at 24-inch or 30-inch centres.

Roof rafters 2-inch by 4-inch set at 24-inch centres and heeled over plate and spiked.

Sheathing.—The wall studs to be covered on the outside with matched siding and on the inside of icehouse only with rough lumber or tongued and grooved sheathing. The rafters to be covered on the outside with dressed lumber and shingles laid 4½ inches to the weather, or other roofing material.

Joists.—The joists of platform to be 2-inch by 8-inch, set at 20-inch centres. The joists to be extended out through wall to form a landing for outside steps. The joists to rest on top of 1½-inch by 6-inch ribbon pieces, housed into and nailed into studding. The outer end of joist forming landing to be brace with 2-inch by 6-inch struts.

Floors.—The oor of icehouse is covered with small stone or coarse gravel to a depth of 12 inches, and well pounded down. The floor of platform room is alid with 2-inch plank, leaving a space of one-quarter inch between each piece.

Crane.—The crane is constructed with a 4-inch by 4-inch post. The boom is 4-inch by 4-inch secured to post with wrought-iron straps, and bolted; also braced with a 1-inch by 4-inch on each side, bolted to boom and post. The winch is constructed of wrought-iron wheel supports, cast-iron gearing and dog, and hardwood spool. The yoke is of wrought-iron.

Tank.—The tank in platform is constructed of concrete in proportion of one part Portland cement, three parts sharp sand, and five parts of broken stone. The inside surface of tank should be plastered 1 inch thick with mortar composed of one part cement and one part sand. The tank requires a 1-inch supply pipe, 1¼-inch overflow pipe, and a 1-inch draw-off pipe with stop-cock.

The openings to ice-house are of 1-inch loose boards, arranged to slide vertically in a groove.

The outside doors are constructed on a 1-inch braced frame and sheathed with 1-inch tongued and grooved boards.

The door to platform room is hung with wrought-iron barn door track and trolley. The rear door to ice-house is hung with heavy T hinges and secured with hasp and door pull.

The ventilating windows are constructed of 1⅛-inch x 5-inch frame with ⅝-inch louvres boards set 3 inches apart and at an angle of about 60 degrees.

The outside steps have a 2-inch strings and 1½-inch treads, housed into strngs, and spiked.

The outside may be painted two coats in any desired colour.

Before putting in the ice, lay 12 inches sawdust or planer-mill shavings over the area of the floor; also surround the ice with at least one foot of the same material. The space over the ice should be well ventilated. This helps to carry og the heat which will accumulate under the roof, and to keep the sawdust or shavings on top of the ice in a dry condition.

SPECIFICATION FOR PLAN No. 2

Icehouse with Dairy.

All lumber used in the dairy should be thoroughly seasoned spruce, which is odourless.

If the soil under the icehouse is impervious clay, drainage should be provided.

Foundations.—Trench excavations to be made as indicated on the drawings. The foundations of the building may be constructed either of concrete or stone walls. A good mixture of concrete in one part of Portland cement, three parts of sand, and five parts of 1½-inch or 2-inch broken stone or clean gravel.

Floors.—Cover the area of the floors with 12 inches of broken stone, coarse gravel or cinders.

The floor of the dairy and the tanks are constructed of 4 inches of concrete and the surface finished with 1-inch coat of cement mortar, trowelled smooth. The mortar is composed of one part cement and two of coarse sand. The oor is graded 1 inch in 5 feet to slope to the channel drain formed in the concrete floor. The platforms for the separator and pump are constructed in connection with the floor, and built to any desired height.

Drains.—The drain piping inside the building, stand-pipes and traps in tanks, and traf at the outside of buildings are of 4-inch cast-iron. The grating to hand hole of outside trap may be either wrought or cast-iron.

Walls.—A 2-inch x 5-inch or 2-inch x 6-inch sill should be bedded on top of concrete or stone foundation walls. The exterior walls are constructed of 2-inch x 4-inch studding set about 20 inches on centres. The corner posts maf be 4 by 4 inches, with 2-inch x 4-inch pieces spiked to two sides to receive the sheathing, or 4-inch x 6-inch with 2-inch x 4-inch spiked on one side. The corner posts should be tenoned into sills, and well braced. The outside face of exterior walls should be sheathed with ⅞-inch tongued and grooved spruce sheathing, then covered with two ply of building paper on the dairy and one ply on the ice-house, and finished with pine siding or clapboards. The inside face of the dairy should be sheathed vertically with ⅞-inch tongued and grooved spruce sheathing. The ice-house may be finished inside with spruce sheathing or rough lumber.

Partition.—The partition studding is 2-inch x 4-inch, and sheathed both sides with ⅞-inch tongued and grooved spruce or rough lumber on the side next the ice-house.

Ceiling.—The ceiling joists over dairy are 2-inch x 8-inch, set 20 inches on centres, with two ply building paper and one course of ⅞-inch tongued and grooved spruce underneath joists.

Roof.—The roof is constructed with 2-inch x 6-inch rafters at 20 inches on centres, and sheathed on the outside with ⅞-inch dressed lumber, and then covered with shingles laid 4½ inches to the weather, or other roofing material.

Doors.—The exterior door to dairy is ⅞-inch battened door with 1¾-inch stiles, stiles rabetted to receive battens. The doors to icehouse to be 1-inch battened doors; one set of loose 1-inch boards to be placed in door openings, as shown on drawings.

Windows.—The windows to be fitted with 1½-inch double sash as shown, size of windows 2 feet 6 inches by 5 feet.

Ventilators.—Construct louvre windows in gable ends with 1½-inch frame and ¾-inch louvre boards.

Finish—The interior of dairy should be given two coats of whitewash. The exterior may be painted two coats in any desired colour.

Before putting in the ice, lay 12 inches of sawdust or planer-mill shavings over the area of the floor; also surround the ice with one foot of the same material.

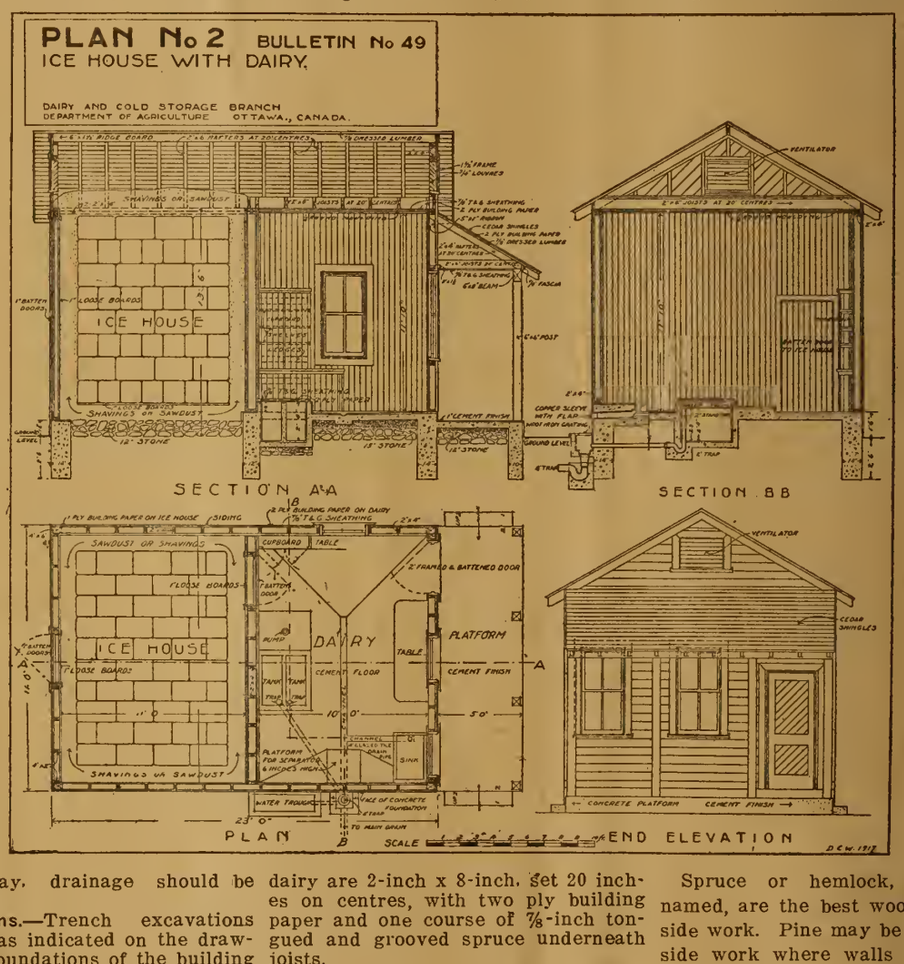
Note.—The insulation of the icehouse would be improved by filling the space between studding with shavings or sawdust, or, on the other hand, if it is desirable to cheapen the construction, the sheathing and paper on the outside of the icehouse may be left off and the studding simply covered with clapboards or siding.

The concrete platform, shown at the end of the building is a convenient place for loading, but it is not a necessary part of the construction and would increase the cost considerably.

SPECIFICATION FOR PLAN No. 3

Icehouse with Refrigerator and Milk Room

All lumber used in the construction of the ice-box, refrigerator and milk room must be thoroughly seasoned, and free from all knots, shakes, or other defects. An odourless lumber like spruce is necessary to avoid the danger of tainting milk or butter.



Spruce or hemlock, in the order named, are the best woods for all inside work. Pine may be used for outside work where walls are insulated on the inside.

Drainage.—If the soil under the icehouse is impervious clay, drainage should be provided.

Founlations.—The foundations may be constructed either of concrete or stone. A good mixture for concrete is one part Portland cement, three parts of sand and one part 1½ or 2-inch broken broken stone or gravel.

Cover the area of the icehouse and milk-room floors with 12 inches of broken stone, coarse gravel, or cinders.

Walls.—The outer walls are constructed by first bedding on the concrete or stone walls a 2-inch x 5-inch sill and upon this sill erecting the corner posts and 2-inch x 4-inch studding at about 24 inches on centres, and a double 2-inch x 4-inch plate on top of studding.

The exteriar walls of refrigerator and ice-box have double studding, staggered as shown. The partition, dividing ice-house from ice-box and

milk-room, has 2-inch x 6-inch studding.

The exterior walls are sheathed with ⅞-inch tongued and grooved sheathing, then covered with two ply building paper on the refrigerator and milk room and one ply on the ice-house, and finished with siding or clapboards. The interior of icehouse and milk-room have single ⅞-inch tongued and grooved sheathing excepting around ice-box and refrigerator, which has double sheathing. (The inside of the icehouse may be finished with rough lumber, excepting that part of the wall which adjoins the ice-box.) The interior of the ice-box and refrigerator has double sheathing throughout, with two ply damp-proof paper between. The space under floor and in walls, partitions and ceiling is filled with sawdust or shavings, preferably shavings. Make a 6-inch opening the full width of partition at top and bottom of partition separating ice-box from refrigerator for circulation of cold air.

Floors.—The floor of ice-box and refrigerator is constructed as follows: level off and cover the earth with about one foot of coal cinders, dry sand or gravel; bed in filling 2-inch x 4-inch sleepers and floor over with ⅞-inch tongued and grooved flooring. Set 2-inch x 6-inch joists at 20-inch centres, and fill in between with sawdust or shavings, then lay a double ⅞-inch floor of tongued and grooved boards, with two ply of damp-proof paper between floors.

The floor in the milk-room should be constructed of concrete and finished with ½-inch of cement mortar, trowelled smooth.

Ceiling.—The ceiling of refrigerator and ice-box is constructed of 8-inch joists, filling, and double sheathing top and bottom, with two ply damp-proof paper between the sheathing underneath, and two ply building paper above.

The ceiling of milk-room is covered with two ply building and one course of sheathing underneath joists.

About 6 inches above the floor in ice-box, place 2-inch x 4-inch bars at 4-inch centres, as shown. The floor of ice-box is covered with galvanized iron extending up on walls, forming a pan, this pan to be connected with a 2-inch trapped drip pipe, as shown.

Roof.—The rofo is constructed of 2-inch x 4-inch rafters set at 24-inch centres, sheathed on top with ⅞-inch dressed lumber and then covered with shingles laid 4½ inches to the weather, or other roofing material.

Doors.—The exterior doors have 2-inch stiles and ⅞-inch battened panels. The doors to ice-box and refrigerator to be fitted with bevelled frames, the edges of doors to be bevelled to fit the frames, and doors double sheathed both sides with ⅞-inch tongued and grooved spruce, and two ply paper between. The 6-inch space in doors is to be filled with shavings, and the bevel faces to be covered with felt or canvas to make as nearly as possible an air-tight joint.

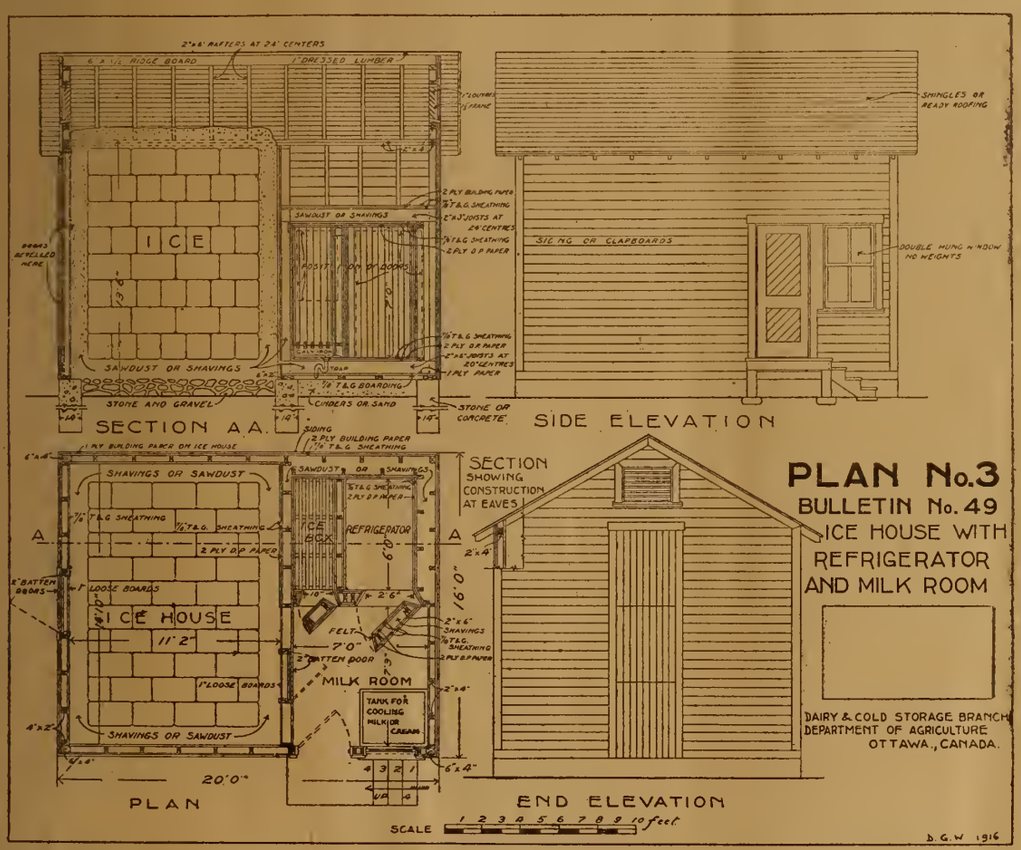
Windows.—The windows to be fitted with 1½-inch double sash, as shown.

Ventilators.—Construct louvre windows in gable ends with 1½-inch frame and ¾-inch louvre boards.

Finish.—The interior of the refrigerator and milk-room should be given two coats of whitewash. The ice-box should have two coats of shellac or boiled linseed oil. The exterior may be painted two coats in any desired colour.

Before putting in the ice, lay 12 inches of sawdust or planer-mill shavings over the area of the ice-house floor, also surround the ice with 1 foot of the same material.

Note.—The insulation of the ice-house would be improved by filling the space between the studding with shavings or sawdust or, on the other hand, if it is desirable to cheapen the construction the sheathing and paper on the outside of the icehouse may be left off and the studding simply covered with siding or clapboards.



SPECIFICATION FOR PLAN No. 4

Farm Dairy with Insulated Icehouse and Refrigerator

All lumber must be thoroughly seasoned and dry and free from all knots, shakes or other defects, and must be odourless.

Spruce or hemlock in the order named are the best woods fr all inside wrk. Pine may be used for outside work where the walls are insulated on the inside.

Foundations.—Trench excavations to be made as indicated on the drawnigs. The foundations ma ybe constructed either of concrete or stone.

A good mixture of concrete is one part Portland cement, three parts of sand, and five parts of 1½-inch or 2-inch broken stone or clean gravel.

The area of the ice-chamber should be excavated to the desired depth. Grade the earth with a slope of 2 inches to one end, and lay one row of 3-inch field tile along the lower end and extending through the foundation to a drain. Four rows of the same sized tile should be laid across the floor and connected with the row draining to the outside. A trap should be provided just outside of the foundation to prevent warm air entering. Cover the floor area with 12 inches broken stone, coarse gravel or cinders, and on top of the filling place 12 inches of shavings or sawdust, covering same with 1-inch rough lumber.

Floors.—The floor of .dairy and tanks are constructed of 4 inches of concrete and the surface finished with 1-inch coat of cement mortar trowelled smooth. The mortar is composed of one part cement and two of coarse sand. The floor is graded 1-inch in 5 feet to slope to the channel drain former in the concrete floor. The platforms for the separator and pump are constructed in connection with the floor and built to any desired height.

The floor of refrigerator and ante-room has a concrete slab with 3 inches of cork board laid on top, and finished with a 1-inch coat of cement mortar.

All concrete floors should be laid on top of broken stone or large gravel ballast, as indicated on drawings.

The drain pipes inside the building, stand pipes and traps in tanks, and trap at outside of builing are of 4-inch cast-iron pipes. The grating to hand-hole of trap outside the building may be either wrought or cast-iron.

Walls.—The walls of dairy are constructed of 2-inch x 4-inch studding set about 16-inch centres, with 4-inch x 6-inch corner posts. The walls are sheathed inside and outside with ⅞-inch tongued and grooved sheathing, and then covered on the outside with two ply builing paper and finished with siding or clapboards. The walls of refrigerator, ice-chamber, and ante-room are constructed of 2-inch x 4-inch studding, staggered as shown on plan, and sheathed with double ⅞-inch tongued and grooved spruce sheathing insidefi with two ply of damp-proof paper between sheathing. The outside is constructed of single sheathing, two ply of building paper, and finished with clapboards or siding. The inside face of ice-chamber walls has two ply of damp-proof paper and then furred with 1-inch x 2-inch furring strips and sheathed with another course of ⅞-inch sheathing.

Partitions.—The partition between ice chamber, refrigerator, and ante-room is constructed the same as the walls, with double sheathing each side and two ply damp-proof paper between. The ice-chamber side has, in addition, two ply damp-proof paper, 1-inch x 2-inch furring strips, and sheathing.

The partition between the refrigerator and ante-room is constructed of 2-inch x 6-inch studding, with double sheathing on both sides and two ply damp-proof paper between sheathing.

Make 6-inch x 12-inch openings at the ceiling and the floor of partition between refrigerator and ice-chamber for air circulation; these openings to have sliding doo dampers.

Ceilings.—The ceilings are constructed of 2-inch x 8-inch joists set at 20-inch centres, with double ⅞-inch tongued and grooved sheathing on top and bottom, with two ply damp-proof paper between sheathing underneath, and two ply building paper above. The ice-chamber ceiling has, in addition, two ply of damp-proof paper, 1-inch x 2-inch furring strips, and sheathing similar to walls. The ceiling of the dairy has two ply building paper and one course of sheathing on underside of joists. The ceilings of refrigerator and ante-room are 7 feet high to underside of sheathing; ceiling of ice-chamber and dairy are 12 feet high.

The walls, ceilings, and partitions of ice-chamber, refrigerator, and ante-room are filled with sawdust or shavings, preferably shavings.

Roof.—The roof is constructed of 2-inch x 6-inch rafters set at 20-inch centres and covered on the outside with ⅞-inch dressed lumber, two ply building paper, and shingles laid 4½ inches to the weather, or other roofing materiali.

Platform.—The platform has 6-inch x 6-inch posts, 6-inch x 8-inch beam, 2-inch x 6-inch ceiling joists sheathed on the under side, and 2-inch x 4-inch rafters sheathed and shingled. (The platforms are convenient for loading and passing from the dairy to the stable, but are not a necessary part of the construction, and will add materially to the cost.)

Doors.—The exteriar doors to dairy are ⅞-inch battened doors with 1¾-inch ledged and braced frame. The doors to ante-room, refrigerator, and ice-chamber are to be fitted with bevelled frames, the edges of doors to be bevelled to fit frames, and double sheathed both sides with ⅞-inch tongued and grooved sheathing, with two ply damp-proof paper between. The doors to have a 6-inch space as shown on plan, filled with shavings. The bevelled face of doors to be covered with felt or canvas to make as nearly as possible an air-tight joint.

Windows.—The small window in the ante-room has a 1½-inch inside and outside sash. A wooden shutter hinged at the top or an awning should be provided to keep out the rays of the sun.

The windows in dairy to be fitted with 1½-inch double hung sash as shown, size of windows 2 feet 6 inches by 5 feet.

Finish.—The interior of the ice chamber should be given two coats of boiled linseed oil or shellac. The interior of the refrigerator, ante-room and dairy should have two coats of whitewash. The exterior may be painted two coats in any desired colour.

SPECIFICATION FOR PLAN No. 5

Insulated Icehouse and Small Refrigerator

All lumber must be thoroughly seasoned and dry and free from knots, shakes, and other defects, and must be odourless.

Spruce or hemlock, in the order named, are the best woods for all inside work. Pine may be used for outside work where the walls are insulated on the inside.

Foundations.—Trench excavations to be made as shown on the drawings. The foundations may be constructed either of concrete or stone.

A good mixture of concrete is one part of Portland cement, three parts of sand and five parts of 1½-inch or 2-inch broken stone or clean gravel.

The area of the ice-chamber floor should be excavated to the desired depth. Grade the earth with a slope of 2 inches to one end, and lay one row of 3-inch field tile along the lower end and extending through the foundation to a drain. Four rows of the same sized tile should be laid across the ground and connected with the row draining outside. A trap should be provided just outside of the foundation.

Cover the floor area with 12 inches of broken stone, coarse gravel, or cinders, and on top of this filling place 12 inches of shavings or sawdust, covering same with 1-inch rough boards.

Walls.—The walls are constructed of 2-inch x 4-inch studding, staggered as shown on plan. The walls are double sheathed inside with ⅞-inch tongued and grooved spruce, with two ply of damp-proof paper between. The outside face has a single course of ⅞-inch sheathing with two ply of building paper, and then covered with siding or clapboards. The ice-chamber, in addition to the above, has the inside sheathing covered with two ply of damp-proof paper and then furred with 1-inch x 2-inch furring strips and sheathed with ⅞-inch tongued and grooved sheathing.

Partitions.—The partition between the ice-chamber, refrigerator, and ante-room is constructed the same as the walls, with double sheathing each side and two ply damp-proof paper between. The ice-chamber side has, in addition, two ply damp-proof paper between. The ice-chamber side has, in addition, two ply damp-proof paper, 1-inch x 2-inch furring strips, and sheathing.

The partition between the ante-room and refrigerator is constructed of 2-inch x 6-inch studding with double sheathing on both sides, and two ply damp-proof paper between sheathing.

Make 6-inch x 12-inch openings at ceiling and floor in partition between ice-chamber and refrigerator for circulation of cold air; these openinfs to have sliding dampers.

Ceilings.—The height of ceiling in ante-room and refrigerator is 7 feet from floor in the clear, and that in ice-chamber is 12 feet. The ceilings are constructed of 2-inch x 8-inch joists set at 20 inches on centres and double sheathed top and bottom with two ply damp-proof paper between sheathing underneath and two ply building paper above. The ceiling of ice-chamber has, in addition, two ply of damp-proof paper 1-inch x 2-inch furring strips and another course of ⅞-inch sheathing similar to walls.

The walls, ceilings, and partitions are completely filled with sawdust or shavings preferably shavings.

Roof.—The roof is constructed of 2-inch by 4-inch rafters set at 24-inch centres and covered with ⅞-inch dressed lumber, two ply buildlng paper, and shingles laid 4½ inches to the weather, or other roofing material.

Floors.—The floor of ante-room and refrigerator is constructed by first laying a course of coal cinders or sand 8 inches thick and bedding 2-inch x 4-inch sleepers on top, then set 2-inch x 6-inch joists at 24-inch centres across sleepers, and finish by laying one course of ⅞-inch sheathing diagonally; cover with two ply of damp-proof paper and 1-inch tongued and grooved spruce flooring.

In plan No. 4, concrete an cork board are used in the construction of the refrigerator and ante-room floors. This construction is much the best, and as it is of permanent nature will be the cheapest in the end.

Doors.—The doors to ice-chamber, refrigerator, and ante-room to be fitted with bevelled jambs, and edges of doors bevelle to fit; the doors are double sheathed inside and outside with two ply of damp-proof paper between sheathing, the doors to have a 6-inch space, as shown, filled with shavings, the bevelled faces of doors to be covered with felt or canvas to make as nearly as possible an air-tight joint.

The exterior door opening into the ice-chamber is a batten door 6 feet by 3 feet, which is provided for stowing ice during the winter season. The frame is bevelled and the edges of the door bevelled to fit the frame. The door is made of two courses of ⅞-inch sheathing, with two ply of building paper between. Two sets of loose boards must be provided as shown on plan, one set to fit into the frame on the inside and the other set to fit as close to the door as possible. These boards are to be placed in position when the ice chamber is filled and the space between (about 10 inches) filled with planer-mill shavings or dry sawdust.

In cases where it is convenient to store the ice through the ante-room, this door may be dispensed with, as a direct opening outside is liable to cause waste of ice unless the filling of shavings or sawdust is carefully packed into place each time the door is used.

Window.—The small window in the ante-room has 1½-inch inside and outside sash. A wooden shutter hinged at the top, or an awning, should be provided to keep out the rays of the sun.

Ventilator.—Construct louvre windows in gable ends with 1½-inch frame and ¾-inch louvre boards.

Finish.—The interior of the ice-chamber should be given two coats of boiled linseed oil or shellac. The interior of the refrigerator and ante-room should have two coats of whitewish. The exterior may be painted two coats in any desired colour.

General Notes

Insulation.—Refrigerating engineers have during the last few years practically discarded the empty space—the so-called dead-air space—once extensively used for insulating purposes. Theoretically, a dead-air space is a poor conductor of heat, but the ordinary air space is not a dead-air space. As one side of the space becomes warmer than the other, the air immediately in contact with it becomes lighter on account of the increase in temperature, and at once ascends, while colder air from the oter side takes its place. Thus we have a circulation of air within the space, and heat is carried from one side to the other by convection.

Moreover, it is extremely difficult to get the work done properly when empty spaces are depended on for insulation. The slightest crack or opening, even a nail hole, tends to destroy the efficiency of this form of construction.

In the insulation of wooden walls, the best practice at the present time provides for an outer and inner shell, as nearly as practicable impervious to air and dampness, with a space between to be filled with some non-conducting material. The width of the space will depend on the filling to be used and the temperature to be maintained in the storage room.

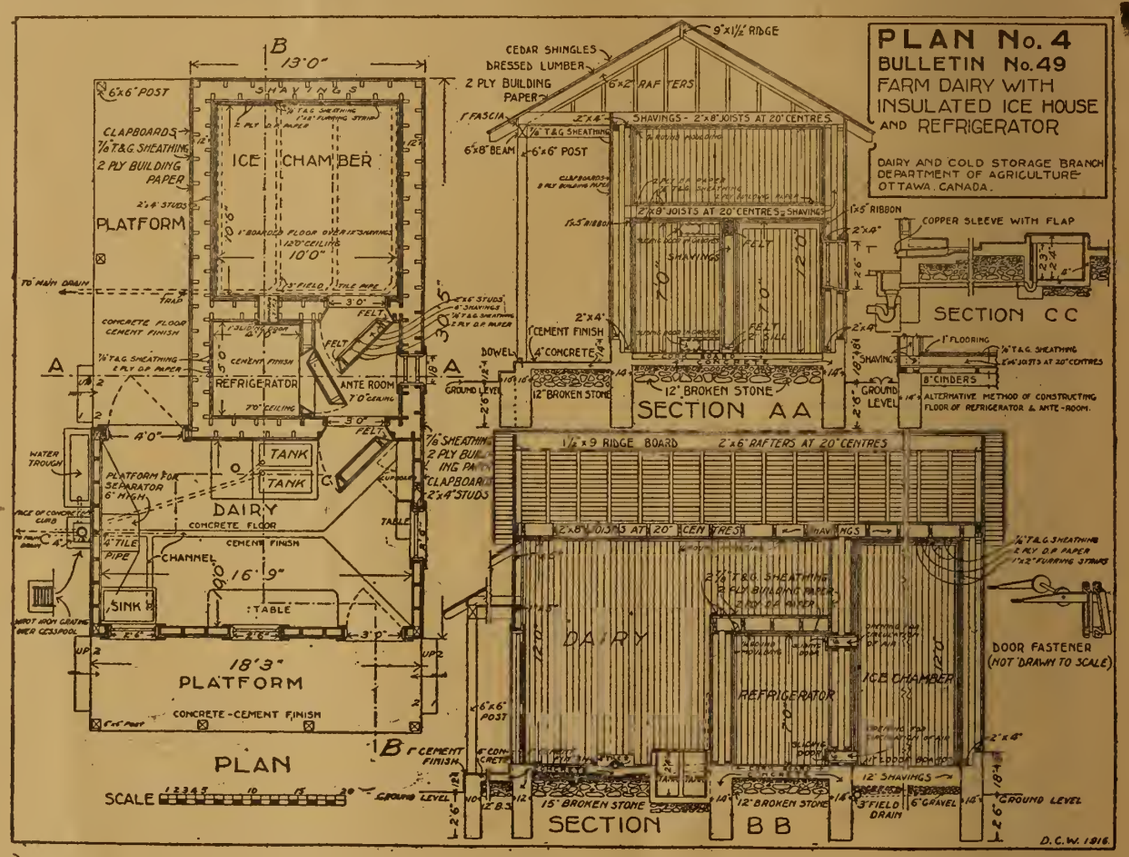
For a cold storage constructed of wood, there is no better material for filling spaces than planer-mill shavings. Where available at all, they are cheap; they are elastic and do not settle readily; but, most important of all, they can be obtained in a very dry condition, which is essential; and further, they do not absorb moisture readily arter being placed in position. There may be some difficulty in obtaining a sufficient supply of shavings in places remote from manufacturing centres, but many of the large sash and door factories now pack shavings in bales, weighing about 75 pounds each, for convenience in shipping. The weight of shavings required to fill a given space will depend somewhat on the kind of wood from which they are made, and also to some extent on how tightly they are packed, but a fair average is from 7 to 9 lbs. per cubic foot of space. They should be packed sufficiently to prevent subsequent settling.

Sawdust versus Shavings.—Because it costs little or nothing and is readily available in most country districts, there has been a tendency to use sawdust for filling spaces in walls in small cold-storage buildings. We would point out, however, that it is not as satisfactory a material for this purpose as shavings, owing to the fact that while shavings are cut from dry ulmber, sawdust is cut from green timber and is generally more or less damp. The dampness destroys its insulating value and encourages the growth of mould and rot, resulting in a musty odour in the storage room which would be injurious to the food stored therein. The growth of mold and heating would also cause settling of the sawdust and would leave open spaces which weakens the insulation. It is very important, therefore, that sawdust which is used for filling walsl must be as dry as possible or the storage will be very unsatisfactory, and will soon become unfit for storing perishable foods.

Insulation must be dry.—One of the problems in cold storage construction is to provide against moisture being absorbed by the materials composing the insulation. In the construction of small ice cold storages, moisture or dampness is more likely to come from the inside, and provision must be made to protect the insulation. It must be understood that dampness, as referred to in this connection, does not imply the presence of water in the ordinary sense, but simply the presence of moisture as we find it, say, in green lumber as compared with dry or well-seasoned lumber.

In a wooden wall filled with shavings, it is the shavings which must be protected from dampness. This can be done by using damp-proof paper between the sheathing, or boarding, on the inside of the walls.

Brick, stone or concrete walls.—If it is desired to erect a building of brick, stone, or concrete, such walls will only take the place of the outside finish of the wooden walls of the plans shown in this bulletin, and the same insulation must be used inside the brick, stone, or concrete. None of these materials have much insulating value, and as erected in an ordinary wall are just about equal, for that purpose, to two courses of lumber.



Brick or cement absorb moisture readily, and unless they are given some special water-proofing treatment, the insulating quality of such a wall is rather low. The outside surfaces of brick walls may be painted with some eect, but where shavings are to be used inside of brick or concrete, the inner surface may be coated with pitch, paraffin wax, or some of the patented coatings on the market. Coating walls with either pitch or paraffin in cold or even cool weather without special apparatus is a rather difficult operation, on account of the tendency of both substances to harden very quickly. In using pitch, care must be taken not to get tar, or any mixture of tar, whic hwould be ruinous on account of its odour. Pitch is odourless when it hardens. If the inside surfaces of brick or concrete walls cannot be properly waterproofed, the next best plan is to put 1-inch furring strips on the wall, then one course of matched lumber, which will form the inside surface of the space to be filled. It will be all the better if the sheathing is covered with damp-proof paper.

Size of ice-chamber.—It is impossible to lay down any general rule for the size of the ice-chambers, as so much depends on what the ice or the refrigerator is used for. In plans 1, 2 and 3, one ton of ice will occupy about 40 cubic feet of space, including covering material. In plans 4 and 5, where no covering material is used, it requires a somewhat less space for a ton of ice, depending on how closely it is packed.

Quantity of ice required for season's supply.—A cubic foot of ice weighs 57½ pounds. One ton of solid ice measures approximately, 35 cubic feet. A consumption of 2 cubic feet (115 pounds) per day for four months would amount to nearly seven tons.

Allowing for the waste when such a comparatively small body of ice is stored, a building 10 feet square and 10 feet high will afford ample space for that quantity of ice, if it is carefully packed.

Fifty pounds per day for four months would amount to three tons. Allowing for waste, a solid block of ice 6 feet square and 6 feet high should be sufficient if properly stored.

For the purpose of estimating the weight of ice roughly by the number of blocks, the following table will be found convenient:—

12	blocks	18	x	36	inches,	8	inches thick	= 1 ton.
10	"	18	x	36	"	1 0	" "	= 1 ton.
8	"	18	x	36	"	1 2	" "	= 1 ton.
7	"	18	x	36	"	1 4	" "	= 1 ton.
6	"	18	x	36	"	1 6	" "	= 1 ton.
5	"	18	x	36	"	2 0	" "	= 1 ton.

Plan for a larger cold storage.—Any person who desires to erect a larger and in some respect a more complete cold storage should apply for a copy of Bulletin No. 36, which gices particulars of a plan designed specially for creamery purposes.

Blue Prints Supplied Free.—Blue prints on a scale of 1 inch to 2 feet for any of the plans in this article will be supplied free on application to the Dairy and Cold Storage Commissioner, Ottawa, Ont.

How to Prepare Whitewash

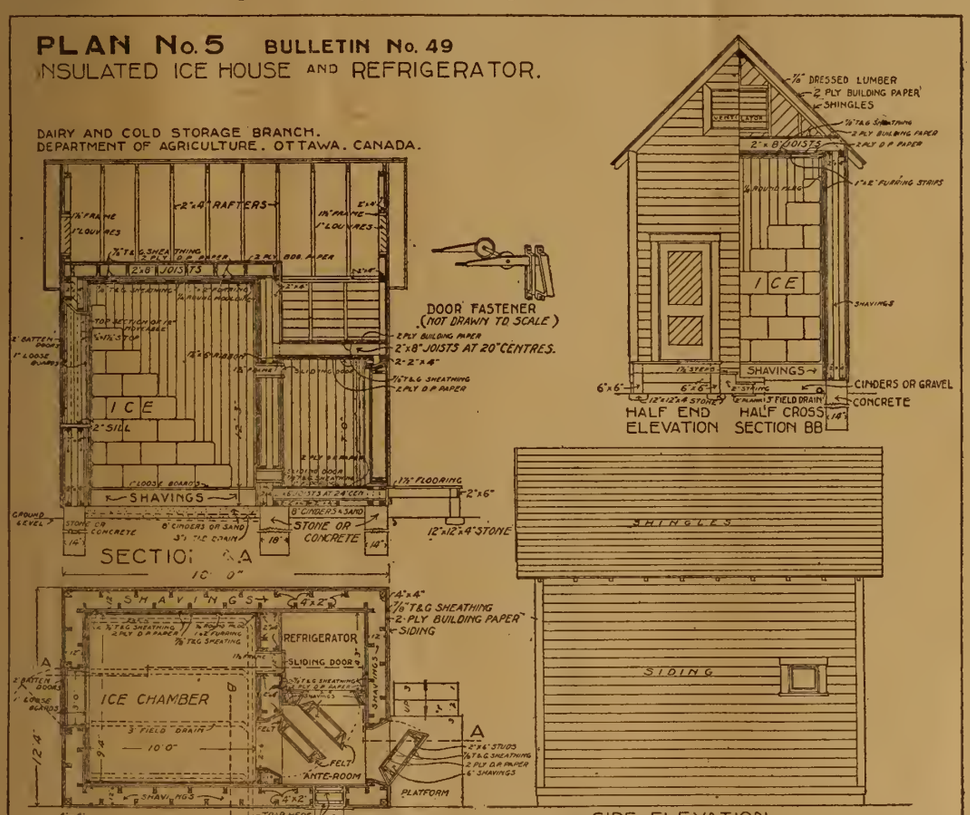
Slake half a bushel of lime with hot water, stirring continuously while slaking, strain it and add one peck of sale dissolved in warm water. The proper consistency for whitewish is a thin paste, and water will have to be added to secure this consistency after mixing the dissolved salt with the whitewash.

To each 12-quart pail of whitewash composed as above, add a good sized handful of Portland cement and a teaspoonful of ultra-marine blue. The cement and blue should be added only as the whitewash is being used, and should be thoroughly stirred into the whitewash; otherwise, when applied it will be streaked.

If there are any pipes or other equipment in the rooms to be whitewashed that will rust, do not use salt in the mixture around the piping.

Do not put on too thick a coat—just enough to cover the surface in good shape—then allow from one to three days for drying. If you dry the whitewash out too quickly it will flake or brush off very easily; on the other hand, a very slow drying will allow the water to soak into the wood and may cause unpleasant odours.

Whitewash containing Portland cement must be used without delay.



NEW BRUNSWICK CROPS FOR 1918

More consideration for the non-perishable crops.

The last month has been one of anxiety for every farmer. The weather has not been particularly good for haymaking and labor has been very scarce. Many have just finished the hay or expect to do so shortly and the general report is that the quality of the hay made late is very poor. Poor hay is of but doubtful value for any class of live stock, except for bedding in the stables, and it is a well-known fact that there is not sufficient stock in New Brunswick to eat the good hay, and the market for any class of hay is not very active. To the casual observer, then, it would appear that New Brunswick has too many acres under hay and the time now being spent upon making poor hay gives practically no return to the farmer for his outlay and would be, perhaps, much better spent looking after a crop of wheat, barley or oats. The conservation and the intelligent direction of available labor was never more important than at the present moment and that spent upon gathering in overripe hay can, no doubt, be used in other channels to the mutual advantage of the farmer and of the country.

We would urge every man who harvests a large quantity of hay to consider a few more acres of wheat, oats or barley, for 1918. The difference in labor would not be very great, except the ploughing this fall, and the crop would be of far greater value than the hay which would grow upon the same land and be of little value due to overripeness. If every farmer could find time this fall to plough a few extra acres of sol for one of the cereals, the increase throughout the province would be enormous. If there is a real food shortage, and we believe there is, we require an abundance of cereals. Every man who earns his living by the sweat of his brow wishes to sell his labor fo rthe highest possible figure, which can be done only when every day is spent at some activity which at least promises well.

The wisdom of depending altogether upon a one crop system can be seriously questioned and it is doubtful if such can be recommended for the average farmer throughout North America. The fatal results of such can be traced from the Gulf of Mexico to the wheat sections of western Canada and to-day prodigious efforts are being put forth to remedy the evil. New Brunswick must not become a crop country. At present too much hay and too little grain is grown and perhaps in some sections too many potatoes and too few cattle are considered. Not one ton of hay should be sold out of the province. The climate is ideal, the country is well watered and the necessary root and grain crops can be grown to make this province one of the great stock producing sections of Canada. Immediately such were to take place the soil problems would be remedied, the fertilizer question would be simpler and agriculture would be given a permanent status more quickly than in any other manner.

The selling of young stock to dealers, who take them out of the country, when hay is a drug on our market, cannot be too strongly condemned. Only mature cattle should pass out of the hands of breeders for the market. The demand for breeding sheep this year is one of the encouraging features of the situation, because never were sheep kept under more favorable conditions than this province offers. Production in 1918 may not be influenced much by giving added attention to cattle and sheep, but the food question will not cease even when war ends. The prospects for ready sales and good prices for livestock are all that could be desired for years in the future. Attention paid to pigs and the keeping of more brood sows in the spring of 1918 will assist in the food situation. Many are considering the killing of their poultry because of the high price of feeds. It is questionable if the profits from keeping poultry were any greater or as great in New Brunswick during pre-war conditions than to-day; the price of eggs is high and is soaring; the price of fowl is also high. Strenuous efforts are being put forth by the Livestock Division of Ottawa to cope with the feed situation and a car-load of chicken feed is to be forwarded shortly to this province. Before depleting any class of live-stock very serious consideration should be given, because it takes no more grain to produce a pound of pork or of chicken or to produce an egg to-day than previously, and the extra price offered for the product will offset the extra price for grain. Every farmer who raises poultry should consider raising the greater part of their food.

We as a people are apt to be stampeded to a degree, occasionally, and this is a time when careful thought and judgment should be applied to every problem. General Maurice stated that the battle in Flanders is at the same stage as Waterloo was at ten o'clock, which means that the man at home has a serious problem also.

Undoubtedly during 1918 the gardens will again be filled and the usual canning will be repeated. The extra acreage of beans will again be planted and if a good crop is had this year perhaps the acreage will be increased.

However, as the plans are now being matured, we would ask that consideration is given to the breaking up of some of the hay land this fall, if time will permit, in order that more cereals may be grown next season, and, in addition, in order that there will be less overripe hay to harvest, thus using labor upon crops that will give greater returns and be of greater value to the country.

The Provincial Department of Agriculture will give every assistance possible. Particular attention is being given just now to the purchasing of live-stock, emphasizing sheep.

ERADICATING THE COMMON WEEDS

The following notes on the eradication of a few of the commoner weeds art taken from a recent bulletin on weeds. Two points are generally emphacized in the work in question, viz., after harvest cultivation and the harrowing of grain in the spring when it is two or three inches high.

Mention should also be made of the far mimplements for weed destruction. Wherever the word "cultivation" is used in the following it may be taken to mean the use of a cultivator, not a disk harrow. The disk harrow is not an implement for destroying weeds, and except to germinate weed seed, say by following after the binder or for early spring work of the same kind it has no place in weed destruction. On the other hand, for weeds with running root stalks like couch, or sow thistle, the disk harrow by cutting up the roots merely aids these weeds in becoming more firmly estahlished.

Harrowing the grain crop from one to three times after it is up two or three inches high, has proved to be one of the best methods of keeping weeds in check, especially annuals, winter annuals and biennials. Usually these weeds come up a few days later than the grain. When the grain is about two inches high, the weeds are just in the two leaf stage, hence very tender, and very easily destroyed. Sometimes the heavy straight tooth harrow is too severe, and the tilting harrow will do the work of killing the seedling weeds just as well. This harrow can be regulated by the lever to go any depth desired.

Couch Grass

In bad places, plow shallow immediately after harvest. Work at intervals with a spring-tooth cultivator until winter sets in, gather any roots brought to the surface, place them in heaps and burn when dry. The following spring continue this cultivation and gathering until June 20th, then seed thickly to barley or rape. In working land to eradicate this plant do not use a disc, as this implement often cuts the running, underground root-stocks into short lengths, each of which will produce a new growth. In using the spring-tooth cultivator endeavor to keep the teeth perfectly clear of rubbish. Try to eradicate this weed when the sun is hottest.

Canada and Perennial Sow Thistle

(1) Plow shallow immediately after harvest. Work with the wide-share cultivator at intervals until late in the fall, then plow deep, turning as many of the roots up as possible. Leave in this state over winter. In the spring continue this cultivation with the same implement until June, then plow again deep, work well and seed thickly to barley. If this system of cultivation is carried out thoroughly for two years it will practically eliminate this pest.

(2) Cultivate early for summer-fallow with the wide-share, spring-tooth cultivator, and then plow shallow. Continue cultivation until July, then plow deeply. At this time of the year the sun is hottest, therefore roots brought to the surface will be killed by the heat. Cultivate the rest of the season or seed to winter rye. In using the cultivator see that the teeth are always kept clean, and do not attempt to work the land when wet. It is also well to work infested areas separately to avoid spreading the pest by distributing pieces of the rootstocks to clean parts of the field. It cannot be hoped to keep this weed in check if stray plants are allowed to go to seed These should be cut with a mower or scythe just previous to producing their seed, or when they first blossom.

Russian Thistle

Hand pull where only scattered plants occur. Where infestation is bad, summer fallowing is the only thorough system of eradication. If land can be worked early in the spring and seeded rather thick after good warm weather comes, the grain will smother the weed to some extent. Harrowing the spring grain is a good means of killing Russian thistle. It is very tender in the early stages of its growth. Growing fall rye is recommended where this weed is prevalent. Stock pasturing on the rye will eat the weed as readily as the rye, and any immediate plants left will be killed by the frost. Russian thistle is an annual.

Stinkweed

(1) Cultivate after the binder and in wet seasons. Cultivate again before winter sets in. Polw shallow the following spring and harrow immediately after the plow. When the seeds have germinated cultivate again and seed thickly to oats or barley. Harrow the grain about three times. Seed the land as soon as possible to timothy, brome or rye grass and leave in hay or pasture for several years.

(2) Cultivate after the binder; plow shallow late in the fall and work down. The following spring plow deeper, work down fine and allow the seeds to germinate. Then plow again still deeper, bringing up more seeds to be germinated and destroyed by surface cultivation. This work will be compelted by the latter part of July when the land should be seeded to fall rye, which can be pastured that fall and during the following spring and summer.

(3) Summer fallow. Plow at least twice; three plowings would give better results.

(4) Seed to timothy or other hay crop. The hay should be cut two or three times the first year; after that the grass will control the stink weed fairly well.

Sweet Grass

Mow and burn while the grass is in bloom in May to destroy the seeds. Then plow deeply to get below the rootstocks which may be brought to the surface by thorough cultivation continued throughout the summer. This will be made more effective by deep plowing as late in the fall as the frost will allow.

Wild Buckwheat

Cultivate immediately after harvesting, so as to encourage the germination of the seeds on the surface. The young plants will be killed by the frost. Harrowing the grain after it is up will kill the seedling plants. Thorough summer-fallowing, plowing before the plants go to seed, and cultivating with a duck-foot cultivator at intervals throughout the summer will rid a field of this pest.

Skunk Grass

In cases where it is growing in hay meadows or pastures, it should be cut before seeding, raked up and burned. It may be necessary to do this twice during the season, but if done at the proper time once it will practically eradicate this pest. Before breaking land infested with this weed it is advisable to burn it over the previous fall.

Wild Mustard

Hand pull and burn plants or small patches. When fields are overrun either of the following methods is recommended: (1) cultivate after harvest by using the disk or cultivator, or plowing shallow and harrowing. Winter will kill all the plants that grow. Cultivate again early in the spring and about June 1st seed to barley. After the barley is harvested cultivate immediately and follow the same procedure the next year. (2) Cultivate after the crop is harvested, then summer-fallow thoroughly the following year. The spring following, work well and sow oats reasonably thick and as early as possible. After the crop is up about two inches high, harrow once or twice and then seed to timothy, if possible, just before a shower and just before harrowing. Seeding with oats is preferable to seeding with barley, as it allows more air for the young timothy.

Tumbling Mustard

Harrow the grain when it is up a few inches. Summer fallow badly infested land and in the spring seed thickly to grain. Cultivate the stubblue after harvest.

Give attention to all old stack bottoms, edges of fields, roadsides, etc. Pasturing land badly infested with this weed with sheep, especially when the plant is young, has been found to be a sure remedy.

Wild Oats

(1) Plow shallow or cultivate immediately after the infested crop is harvested. In the spring as soon as a good growth has started plow again about four inches deep. This will bring a supply of seeds near the surface to germinate and to be destroyed as previously. Then about July 15th it should be plowed deep as possible, worked well and seeded to winter rye, which can be pastured the same fall and following spring.

(2) Start cultivation as stated in (1) but plow deep reasonably early the following spring. Work this well until June, then seed thickly to barley and oats. Cut for green feed. After green feed is harvested, cultivate or plow shallow. Leave in that state until spring. Work well until assured of good, warm growing weather, then seed reasonably thin to oats, also to timothy. Cut oats for green feed, and leave the land in timothy from two to five years.

MANAGEMENT OF DAIRY COW REQUIRES CAREFUL CONSIDERATION AT THIS SEASON OF THE YEAR

At this season of the year it will pay every dairyman to take an inventory of his home-grown feeds and the number of cows he expects to feed during the winter. He knows approximately the amount of home-grown feeds he will have, and whether his hay is good or indifferent. If it was cut early and properly cured it is good; but if it stood until too late it will not have nearly the feeding value of that cut at the proper time. He knows the amount of ensilage, fodder and straw he can properly use. He knows the number of cows in his herd that are worth keeping over for another year.

The profits from his farming for the coming year will depend in a large measure upon how he begins the year, or in other words, how he balances his feeds and the kind of cows he keeps on his farm. If he has nothing but corn fodder and timothy hay for roughage, it will pay him to sell the timothy and buy clover or alfalfa if he can; or, if not, he had better use his corn fodder to the best advantage possible and buy supplemental protein feed. Cows cannot do their best on timothy hay and corn fodder, as so many cows are fed. When these feeds make up the bulk of the roughage they should be fed with protein feeds that will make up the deficiency of milk-making elements. Protein is needed to build up the blood, bone and muscles. Every part of the body but the fat is made out of protein in combination with mineral matter and water. Corn fodder and timothy hay do not contain the needed amount of protein to enable the cow to give a heavy yield ofm milk. It is better to sell some of the cows than to try and keep the whole herd through the winter without plenty of corn silage and good clover hay. If we do not have clover, or alfalfa hay, we will have to buy some kind of supplementary feeds to furnish the necessary amount of protein. Young cattle will need practically the same kind of foods as milk cows. They are not laying on fat, hut growing. They need the kinds of feed that will keep them growing and hardy and enable them to make a good growth the next summer when turned out to pasture. It will be better to sell some of the timothy hay and buy a little bran, oats or oilmeal for the young stock and milk cows. Feed is high, but we must use it in proper combinations to maintain a suitable milk flow and keep young stock in a thrifty, growing condition.

In my experience producing milk for the city trade and buying new cows to replenish my herd, I have had an opportunity to study the methods of feeding and handling young cows in the farms where I go to buy cows. As a general rule I prefer to buy cows in the fall because I plan to make the bulk of my milk during the winter and because it is ushally possihle to buy good cows for less money in the cheese-producing sections, where I buy them from, than it is in the spring. Then again, we it is in the spring. Then again, we do not have enough pasture land to keep extra cows during the summer and autumn months.

It seems almost incredible in these days of advanced dairying that so many dairy farmers will neglect their cows during this critical time of the year. There is no possibility of any man making a success of the dairy husiness life if he allows his cows to fall away in milk yields and flesh condition during the autumn months. By keeping dairy cows in a drouth-stricken pasture, in a state of famine and starvation, so that you can see the full umber of ribs in their bodies, the very condition of the animal is changed before it goes into the barn for winter. Every time I have bought a bunch of these run-down cows late in the fall and tried to bring them to life I have lost money. Looked at from every side of the question the fall care of the dairy herd is one of the most important factors in determining the profits of the year. Any practical dairy farmer who has good natural pastures, can buy cows that are in comparatively low flesh during the spring and get something out of them during the summer, but the cow that goes into the barn at the beginning of the winter in a rundown, emaciated condition is about as bad a proposition as I have ever had to deal with on the dairy farm.

No cow is going to produce a satisfactory flow of milk when her system is rundown and her circulation and skin are out of condition. No matter how good feeds she has or how well they are proportioned, it requires four or five months to get her in good working condition and that means a loss of time and many dollars' worth of high-priced grain feeds before she can begin to yield any profit from them. We must have evenly-balanced cows as well as evenly-balanced rations to begin the winter with, if we realize a profit from our business.

The question of handling new cows that are brought onto the farm in the fall and fed heavily for milk production in the winter needs study and attention. As a rule I prefer to buy new cows from dairy farmers who keep their cows in good condition and do ot feed heavy rations of grain feeds. These new cows all have an individuality of their own and we should study them and get acquainted with it as soon as possible. By making inquiries as to their subsequent care and feed can we plan our management so as to get them settled down to the new conditions as quickly as possible. Then we can gradually change their rations until they can make a proper use of a full ration of grain and roughage without danger of upsetting their digestion.

The cow's habits and eccentricities depend a great deal upon how she has been treated and she should be watched at the start and given sensible treatment until she has settled down to the new order of things. It requires patience and common sense to buy new cows and get them settled down to their new surroundings and producing profitably, but the little extra care and thoughtfulness pays big returns.

Keeping the cows comfortable is another neglected point in the fall management of the herd. As soon as the cold nights come the cows should be kept inside, but I think it best to

allow them to run out whenever the weather is favorable in the daytime. The extreme cold winter weather and the comparatively short season of pasture life, make it desirable for the cows to be out and get all the good air and sunshine possible during the year. If we allow the cows, more particularly the young heifers, to become dry early in the fall, we are cultivating a habit that is very hard to overcome, for once a heifer or cow is allowed to go dry after being milked a few months it is very hard to make her continue the milking period for a longer time after the grain freshens. L. J. M.

HOW NEW BRUNSWICK FARMERS CAN HELP

Old sheep growers will find it to their advantage to hold what ewe lambs they have and breed them. Plan to double your wool and lamb crop next year. To those farmers who never carried any sheep, or who have gone out of the business, you will find it profitable to stock up with a bunch of ewes and a pure bred ram. To those people who have areas of uncultivated land, why not make it yield you something. You can make it do so by stocking it with sheep.

Why New Brunswick Farmers Should Grow Sheep

1. It is out duty to do so. We must help feed and clothe our Allies.
2. Progressive Agriculture depends on Livestock. We want our Province to come to the front as an Agricultural centre.
3. We have opportunities for sheep production, the rich valleys, the upland pastures, plenty of water, abundance of hay, and a great turnip country. Thus conditions are just right.
4. In these days of high priced labor, why not work along the line of least resistance. Sheep require less labor than any other class of livestock.
5. Money invested in sheep yields a fine dividend, the investment is small and the turnover quick.

Information Re Sheep Production

The Livestock Division of the Department of Agriculture stands ready to aid the farmer in any way. If he wants advice on any point, such as the best breed, where to locate foundation stock, probable cost, feeding, housing, flushing out, or any point that he is in doubt about, we will be glad to supply him with the information. Then we have some literature available for distribution which we will gladly forward upon request.

The new Dog Law offers protection from what has formerly been a serious drawback to the Sheep Industry. Men interested in this phase of it should study the new Dog Law and see that it is put into force in their parish.

For further information communicate with the Livestock Divison of the Department of Agriculture, Fredericton, N. B.

SHIPMENTS OF HORSES OVERSEAS

Since the Great War started in August 1914, the British Government have purchased in Canada and the United States, hundreds of thousands of Horses and Mules and shipped them overseas to France, Italy, Russia, and other Battle fronts, with practically no loss from sickness or disease,—the arrival of such a vast multitude of these noble animals in such excellent condition is largely attributed to the placing of a **Lump of Rock Salt** in the feed box of each horse on the Steamer.

Too little importance is given to the great health giving properties of this very inexpensive food, by our Maritime Farmers. Lump Rock Salt should be placed in a convenient place in the Manger of every horse and cow. Sheep, hogs, are equally benefitted by Rock Salt, and should always be provided wtih same. GANDY & ALLISON, North Wharf, St. John, N. B., have the best English Rock Salt always in stock and are in a position to make prompt shipments.

HOLD YOUR EWE LAMBS THIS FALL

A number of farmers complain that a spring lamb will not give a lamb crop the first year. They will if properly attended to. Just as soon as the lambs are weaned turn them into a field of after-grass. Keep them growing and thrifty and just before the breeding season flush them out with a little bit of grain. This will insure a lamb crop the next spring.

What an Amateur Has Done

Mr. W. C. Allison, of the firm of Manchester-Robertson-Allison, has a farm at Rothesay. Last fall he purchased six grade ewes and a pure bred Shropshire ram lamb. This spring he sheared an average of eight pounds of wool from his ewes and he had a lamb crop that averaged 1 5-6 lambs per ewe.

Wool sold for 60c, that is each ewe gave a wool crop valued at $4.80. Lambs are easily worth $10 a piece this fall, that is equivalent to $18.30 from each ewe for lambs, thus he received a total of $23.10 from each ewe for wool nad lambs. This is an exceptional case and the high net income could not have been secured if he had not given his stock careful attention. He flushed his ewes in the breeding season—hence the big lamb crop.

The Outlook for 1918

This year wool sold for 50c and 70c per pound. Next spring it will be just as high and very probably higher. Meat prices will hold strong for years to come. If you are dubious about wool prices next year just stop and think where the wool for two million American uniforms is coming from. If you still fear low prices, think of all the blankets and socks required for American and Canadian soldiers. If you fear low meat prices consider the huge standing armies that are, and will be training in the United States. It behooves us people who stay at home to provide these armies with food and clothing. We are face to face with a responsibility and an opportunity. Let us shoulder the responsibility and take advantage of the opportunity. We owe it to our Empire and we owe it to New Brunswick.

FINISHING HOGS ECONOMICALLY AT PRESENT FEED PRICES

In choosing feeds for fattening hogs choice is of necessity more limited than in the case of other classes of stock. With young pigs, where skim-milk and pasture are available, the use of the higher priced meals and concentrates may, in view of high price, be limited and full benefit derived from the former cheap, home-produced feeds. With a reasonable amount of wheat middlings, shorts or ground oats, good growthy pigs may thus be produced. For the finishing period, however, a more concentrated, more rapidly fattening ration is required. The swine-feeder at once asks, "How can I profitably finish hogs at present feed prices?"

Corn, barley, oats, middlings and shorts are possibly the five most desirable grains and meals for hogs in Eastern Canada.

With corn at from $88.00 to $90.00 per two,—barley, $60.00—oats at $65.00, approximately, and with the two former meals most difficult to procure,—some cheaper grain must be used in the finishing ration. Wheat middlings and shorts, even though high in price, ($45.00 approximately), must be relied upon for the major part of the meal ration. At the above prices middlings offers digestible nutrients at a lower net cost per ton than any one of the grains previously mentioned. By net cost is meant the total cost of the digestible nutrients, less their manurial value.

Oats or barley, one part, shorts and middlings, two parts, with some milk product or, lacking the latter, ten per cent oil meal, should supply as economical a growing ration as is generally available. With the likelihood of a material drop in the price of oats and the more problematical prospect of cheaper corn, when the new crop moves, the above ration could be improved. Corn, shorts, and oats, equal parts with skim-milk is an excellently balanced ration. The addition of corn, even as a small proportion, to the shorts, middlings, skim-milk ration would distinctly improve it as a finishing ration. Corn, must, however, reduce materally in price to be considered an economical hog-feed.

At the present time feed wheat, as procurable in Western Canada, forms an excellent hog-feed.

At the present time feed wheat, as procurable in Western Canada, forms an excellent hog-feed, as has already been well demonstrated. To the more central and Eastern sections this particular feed is not generally available. In many localities however, an elevator by-product known as buckwheat screenings, may now be purchased. Further information concerning the distribution of this material may be had from C. E. Austin, Mgr. Government Terminal Elevators, Fort William, Ont.

Analysis of this particular grade of screenings reveals the following constituents:—Wild buckwheat, 58 per cent.; broken wheat, oats and flax, 29 per cent.; weed seeds, 9 per cent.; chac, 4 per cent. In view of the weed seeds present it should be as finely ground as possible.

Experimental evidence, as acorded by swine feeding tests, at the Central Experimental Farm, would go to prove that this material is of considerable value. During the winter of 1914-15, in an experiment calculated to throw light on the value as a hog-feed of elevator by-products, as represented by the various grades of screenings, buckwheat screenings compared favourably with a standard meal and milk ration. Two of the rations compared were as follows:—No. 1. Shorts, three parts; oil meal, 1 part; plus skim milk. No. 2. Finely ground buckwheat screenings plus skim-milk. Without entering into the details of this test it may be stated that the pigs fed buckwheat screenings, while not so fat as those fed the regular meal ration and standing therefore slightly lower in total gains, stood first in economical production per 100 pounds gain. With the meal ration valued at $28.00 per ton (1915 prices) and the buckwheat screenings at $14.00 (nominal) the cost per pound gain was 4.7 cents in the case of the pigs fed the former and 2.7 cents for those fed the latter ration. On the actual prices paid or charged for meal, skim-milk and roots, and actual prices paid or charged for meal, skim-meal and roots, and figuring on the basis of total gains produced by the two lots, buckwheat screenings showed a comparative value of $27.60 per ton.

FOOD CONTROLLER'S ADVICE

Following are suggestions put forth by Hon. W. J. Hanna, Canadian Food Controller:—

1. Use perishable foods. Save garden truck that has been produced so abundantly this summer. Preserve, dry, can and store.
2. Eat more fish.
3. Substitute other cereals for wheat products—cornmeal, buckwheat flour, rice flour, and above all oatmeal.
4. Don't throw good food into the garbage can. $50,000,000 is wasted every year in this country by carelessness in the kitchens.
5. Preach once more the good old fashioned gospel of the clean plate. Do not let children food at their meals. Do not waste it yourself.
6. Organize. Various women's organizations are already active. Their leaders will tell you what to do. Get in touch with the workers in your own district.

DAIRYING.

VALUE OF MILK IN THE HIGH COST OF LIVING PROBLEM

Economy in the diet does not always depend upon limiting the use of certain foods, but sometimes it is a question of actually increasing the use of foods which furnish nutritive material at relatively low cost. Milk belongs to the latter class, and the housewife would do well to study its food value, and decide whether her family is using as much as it should. The average person in this country uses only a little more than a half pint of milk daily, nnd this quantity can very profitably be increased when safe milk is available.

Many people think of milk only as a beverage, but, if they understood that it is in reality a nourishing food, they would increase their daily allowance.

We eat foods for two main reasons: First, to renew body wastes and promote growth by forming new tissues and fluids, and, second, to supply energy for carrying on body functions. Milk contains the body-building materials (protein and mineral substances, such as lime and phosprorus).

The following table, compiled by specialists of the U. S. Department of Agriculture, shows the quantities of various foods needed to supply as much protein or energy as one quart of milk:

Protein

1 quart of milk.
7 ounces of sirloin steak.
6 ounces of round steak.
4.3 eggs.
S.6 ounces of fowl.

Energy

1 quart of milk.
11 ounces of sirloin steak.
12 ounces of round steak.
8½ eggs.
10.7 ounces of fowl.

Another method of comparison is shown by the table below, in which the relative value of certain foods, as economical sources of protein, is given:

	Is as cheap as	
Milk at	sirloin steak at	Or eggs at
7c a quart	16.3c a pound	17.6c a doz.
8c a quart	18.6c a pound	20.1c a doz.
9c a quart	21.0c a pound	22.6c a doz.
10c a quart	23.3c a pound	25.1c a doz.
12c a quart	27.9c a pound	30.2c a doz.
15c a quart	34.9c a pound	37.7c a doz.

According to this table, if milk is selling at 10c a quart, sirloin steak must sell as low as 23.3c a pound, and eggs at 25.1c a dozen, to supply protein at equal cost.

To Supply Energy at Equal Cost

When milk is	Sirloin steak must not be more than	Eggs not more than
7c a quart	9.9c a pound	9.3c a doz.
8c a quart	11.3c a pound	10.6c a doz.
9c a quart	12.8c a pound	11.9c a doz.
10c a quart	14.2c a pound	13.2c a doz.
12c a quart	17.0c a pound	15.9c a doz.
15c a quart	21.3c a pound	19.8c a doz.

It can be seen, therefore, that milk even at 15c a quart, is a cheap source of energy as compared with sirloin steak and eggs.

In comparing foods it is necessary to consider both the protein and the energy furnished. Neither one alone can properly be used as a basis of comparison, nor is there any correct way to reckon the value of a food by considering the total amount of nutritive elements.

It is very difficult to compare foods on the basis of the mineral matter they contain, but all physiologists agree that milk is extremely valuable from this standpoint. Indeed, it is the food prepared by nature especially for the growth and development of the young. A quart of milk a day is a good allowance for a young, growing child.

In addition to being an economical food, milk is usually easily digested, and requires no cooking or other preparation for the table. Specialists of the department have also found that it is digested better when taken with other foods.

There the innumerable ways to use milk in cookery, such as in puddings, blancmange, soups, chowder, "junket," and many others. In all these ways it is both appetizinz and nourishing.

NO FAULT OF FEED BILL

There seems to be an organized effort on the part of agricultural press and the farmers' organizations, to lay all the blame for high-priced milk on the feed bill, and very frequently an effort is made to blame the high-priced feed bill on the feed merchant.

Now, we think, in justice not only to the feed merchant, but the feed trade in general, that such statements should not be printed without proper investigation.

We deny that there ever was a time when the feed bill was larger than the milk check, unless the dairyman was giving feed to cows that should have gone to the butcher rather than be kept for dairying purposes. The truth of our statement can readily be figured.

It takes one pound of grain or feed to three or four pounds of milk. Rarely does a dairyman feed heavier than one to three, unless it is to very high testing cows that might get one pound of grain to 2½ pounds of rich milk.

Even with feed at $60 per ton, or 3c a pound (which we think is higher than has ever been charged), that would mean that the dairyman was not getting over $1 per 100 pounds for his milk. We have never heard of milk selling so cheap that the dairyman could not get even $1 per 100 for it.

The United States Department of Agriculture shows that for 100 pounds of milk, it requires on an average 33.4 pounds of grain, together with roughage, silage, etc. This grain, figured at $50 per ton, comes to 83½c, so that according to the United States Department of Agriculture the cost of the grain for 100 pounds of milk was 83½c. The total cost of 100 pounds of milk, including labor and overhead charges, such as interest and insurance, came to $3.33 per 100 pounds of milk, so that the cost of the grain was about one-quarter of the total.

It may interest you to read these figures, set forth in tabulated form, as furnished by the United States Department of Agriculture:

Cost of Producing 100 Lbs. of Milk	
33.4 lbs. grain at $50 ton	$ .835
44.6 lbs. of dry roughage at $17.50	.7805
145.3 lbs. silage at $10	.7265
Pasture	.087
3½ hrs. man labor at 15c	.525
½ hr. horse labor at 20c	.10
Total	$3.054
Insurance, interest, etc.	.276
Total	$3.33

The above figures are based on a cow giving 5902 lbs. of milk yearly. The amount of production is comparatively low, and the figures of cost should be materially reduced for a higher producing cow.

In view of all the agitation concerning the high prices of feed as bearing on the cost of milk, it is interesting to note from the above table that even if the cost of the grain were cut in two, down to $25 per ton (which is lower than feeds have sold at for a long time), it would only succeed in reducing the cost of milk 42c per 100 lbs., or a little over ¾c per quart. Therefore, it is apparent that the high price of feed can only be reasonably charged with ¾c per quart of the increased charge for milk, and that is the full extent of the benefit that can inure to consumers if the price of feed were reduced by one-half.

We might incidentally point out that it is probably hopeless to expect any reduction in the price of feed to such a basis as $25 per ton, unless our big corn crop can be marketed at from 50c to 60c per bushel. The controlling influence in the price of feeding stuffs is the value of corn, and with new corn quoted in Chicago at around $1.20 per bushel, or over $42 per ton, it is hardly reasonable to expect that other feeding stuffs will decline materially.

The Larrowe Milling Co.
Detroit, Mich.

MILK THE CHEAPEST ANIMAL PRODUCT

In the campaign being carried on in the United States to save food and reduce living expenses, some interesting facts are being brought out regarding the relative values of the different foods. For instance, the University of Missouri College of Agrichlture points out that 1 quart of milk is equivalent to ¾ of a pound of lean beef, 8 hen eggs, 2 pounds of chicken (including bones as bought), or ½ pound of white bread. In other words, a glass of milk will furnish as much food as two whole eggs; or a meal containing 2 pounds of chicken would have been fully as nutritious if a quart of milk had been substituted for the chicken. When milk is 10 cents a quart, chicken 25 cents a pound, and eggs are 40 cents a dozen, 10 cents worth of milk equals in food value, 50 cents worth of chicken or 26 cents worth of eggs.

A still more striking way of expressing the value of milk is to state what one could afford to pay for milk in order to get the same quantity of

ASSAM Teas for Economy

Assam teas are the strongest and richest grown. It is of these teas that Red Rose Tea chiefly consists. That is why it yields the very large number of 250 cups to the pound—at the cost of about a cent for five cups, and every cup rich, strong, delicious tea.

Children Had Eczema
Doctors Failed to Cure

Two Letters Which Prove the Efficiency of Dr. Chase's Ointment as a Cure for Eczema.

Fortunate are the mothers who know the virtues of Dr. Chase's Ointment, for there is no treatment so suitable for use after the bath to relieve irritation and chafing and to thereby prevent eczema and similar skin diseases.

Mrs. W. L. Barnes, Timmins, Ont., writes:—"I want to tell you about the case of my little boy, who had baby eczema when he was three months old. It started on the top of his head, on his forehead and around his ears. The doctors failed to do him any good, so I tried Dr. Chase's Ointment on the recommendation of a friend, and in a month's time the child was entirely free of this disagreeable skin disease. He is now four years old, and has never had any further trouble from ailments of this kind. I also have great faith in Dr. Chase's Nerve Food, and believe that it cannot be beaten as a restorative for pale, nervous women."

Mrs. George McNair, River Charles, N.B., writes:—"We use Dr. Chase's Ointment in our home, and would not wish for anything better for cuts, burns and bruises. A few years ago a friend of mine, whose baby was terribly afflicted with eczema had her child treated by their own family physician, but the little one got no better. They tried several remedies, but they all proved useless in this case. Upon the advice of a neighbor they got Dr. Chase's Ointment, and before the first box was used the child was completely cured. I can also recommend Dr Chase's Nerve Food to suffering friends who I know will be glad to learn of something to relieve their nervous trouble. You have my permission to use this letter for the benefit of others."

Dr. Chase's Ointment, 60 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

The St. John Business College

S. KERR Principal

food which is now received from beef at 20 cents and chicken at 25 cents a pound. If beef is worth 20 cents per pound, milk is worth 15 cents per quart. If chicken sells for 25 cents per pound, milk is worth 50 cents per quart. If one can afford eggs at 40 cents a dozen he can afford to pay 26 cents a quart for whole milk.

Cream cheese is just about six times as concentrated as milk, which means that one pound of cheese is equivalent to 2 dozen eggs or about 2 pounds of beef. Good cheese at 40 cents a pound is about 5 cents cheaper than beef at 20 cents and 80 cents cheaper than eggs at 40 cents a dozen.

This analysis is sufficient to show that milk at ordinary prices of 8 and 10 cents a quart is one of the cheapest foods available. Bread is cheaper and makes a very good meal with milk. Milk is not only cheap, but it contanis some substance, present in butter but lacking in lard and oleomargarine, which stimulates growth of childres. Every growing child should receive at least 1 quart of milk a day.

Minard's Liniment Co., Limited.

Gentlemen,—I have used MINARD'S LINIMENT on my vessel and in my family for years, and for the every day ills and accidents of life I consider it has no equal.

I would not start on a voyage without it if it cost a dollar a bottle.

CAPT. F. R.DESJARDIN,

Schr. "Storke," St. Andre, Kamouraska.

WHAT IS A STARTER?

The ripening of cream is simply the development of acid in it, in other words, ripening is just the souring of the cream. At a certain stage in the development of the acid cream will churn to best advantage, and in creamery work this rharacteristic is taken advantage of, the cream being tested during the ripening process by means of the acid test and churned when the proper percentage of acid is present. This, however, is not possible under farm conditions, the taste, smell and appearance of the cream being used as a guide in determining whether or not it is hipe enough to churn.

A starter is a quantity of milk in which the particular organism or germ that causes cream to sour or ripen has been allowed to develop. A starter is made either by taking some fresh, clean milk and permitting it ti sour under favorable temperature conditions, about 75 degrees F., or by using commercial starter which may be purchased from most creamerf supply houses. If cream has been pasteurized, as is the case where a high-grade, long keeping creamery butter is made, it will contain none of the ripening organisms or any other, so that the addition to it of the particular organism that causes the formation of lactic acid will cause it to develop that acid and nothing else. In this way it is possible to make a butter of very high quality that will geep good for a long time. The starter is added to the cream some hours before churning and the development of the acid watched and checked at the proper stage.

PREPARE DRY COW FOR HER LACTATION

Every dairy cow, in order to give the best results, requires a rest of six weeks or two months between lactations. During this time she should be prepared for her year's work, her tissues built up, and her digestive tract rested and cooled as much as possible. Of course, nourishment must be supplied for the growing fetus.

If the cow is dry during the summer or early fall she will need very little extra care if she is on good pasture. A pasture separate from the general herd is advisable as there is then less danger of injury. During this period no more grain than is necessary should be fed, as it allows the digestive system of the cow to rest, but a few pounds of oats and a little bran will often be found advisable. If the cow is in poor condition a little corn may be added, but it is not advisable to give much of such heating feeds. If it is necessary to flesh up the cow this should be done gradually.

If the dry period occurs in winter the ration should consist of 20 to 25 pounds of corn silage with a liberal allowance of legume hay and a grain ration consisting of a mixture of 3 parts ground oats, 2 parts wheat bran and 1 part oil meal; the amount of the grain ration being governed by individual requirements.

During this period the ration should be laxative in nature and should contain little of such heating feeds as corn, and feeds such as cottonseed meal and timothy hay should be avoided.

A few days before freshening, the grain ration should be considerably reduced and at this time a mixture of 2 parts bran and 1 of oil meal is excellent, as it keeps the bowels laxative. If this mixture does not give the desired effect a dose of 1 quart of raw linseed oil or 1 pound of epsom salts should be given. Freedom from milk fever and other post-parturient troubles is in large measure due to the care with which the cow is handled and fed just previous to freshening.—Iowa Circular 34.

Canada Needs Food Producers!

Never has the need for increased food production been so urgent as NOW. Poultry and Eggs form a large proportion of the nation's food supply.

You can "do your bit" towards helping Britain and the Allies win the war.

MILKING THE COW

As a discussion has occurred between some friends as to the proper way of milking a cow, I would be much obliged if you would explain whether it is right to milk the two fore teats together and then the back ones, or to milk the side teats together? Also which way makes the cow's udder look to contain equal quantities of milk in each of the four parts. B. E. M.

So far as we know, no scientific investigations or exhaustive experiments have been made regarding the best method of milking, and in the absence of this evidence every man can think and practice what he thinks best. Some milk first the two front teats, others the side teats, and again others the front and back on opposite sides. Some also think that only a small quantity should be drawn from each teat at a time, thus bringing all along toward completion nearly at the same time. There are those, too, who think that by milking the lightest quarters first they will improve and become equal to the others, but this has not been demonstrated to the satisfaction of the public. Every man that milks thinks his way the best—in fact there is probably little difference which way it is done so long as one gets all the milk.

Manipulation or kneeding of the udder is no doubt a good practice, especially a light quarter, and will likely give better results than particular attention to the order in which the milk is drawn.

PULVERIZED LIMESTONE

SWEETENS THE LAND AND PRODUCES HEAVY CROPS

The demand last season for our "Clairmont" Brand Pulverized Limestone was so heavy we were unable to fill a great many orders. We expect a very heavy business for 1918 and would advise all booking now and getting their supply early. Our Limestone is showing wonderful results.

FARM MEDICINE CHEST AND PROPER USE OF ITS CONTENTS AS FIRST AID

The breeding, feeding and maintenance of horses, cattle, sheep, swine and poultry on the farm necessitates the keeping of a supply of simple drugs for first aid treatment in time of sickness. While the trained veterinarian should and no doubt will be employed wherever possible for all serious attacks of disease, the farmer must be prepared, and know how to relieve sick and suffering animals when emergency requires. Often the veterinarian cannot come "right way" and at such times a dose or two of appropriate medicine may save life, or prevent an attack from going too far before the veterinarian can prescribe. For these reasons we shall present here a list of needed drugs and offer a few hints as to their proper use.

Storing the Drugs

The drugs to be mentioned should be kept out of the way of children and where they will not freeze or be exposed to direct sunlight. Each should be labeled, and if poisonous, that, as well as the name of the drug, should be plainly shown upon the label. Keep powdered drugs in tightly closed Mason jars, else they will soon lose their strength. Fluid medicines may be kept in the original bottles or in stoppered bottles, such as druggists use. Also keep on hand a few clean quart, pint, half-pint and smaller bottles with new corks for each, and some small tin boxes or wide-mouthed bottles for ointment. There will be needed, too, a glass graduate for the measuring of doses, scales for weighing, a galss funnel for filling bottles, a medicine dropper, and a small mortar with pestle for mixing and powdering drugs. A flour sifter also comes ni andy, as does a slab of plate glass and a spatula for the making of ointments. Experts also keep on hand some large and small gelatine capsules for the administration of drugs.

Doses of Medicine

In giving medicines the following measures will be found approximately correct:

1 teaspoon holds about 1 dram.
1 dessertspoonful halds about 2 drams.
1 tablespoon holds about ½ ounce.
1 wineglass holds about 2 ounces.
1 tea or coffee cup holds 5 to 8 ounces.
1 tumbler holds about 8 ounces (½ pint).

The drugs to be kept on hand may well be listed according to their special work or purposes as follows:

Blister

For a stock supply melt together three pounds of lard and one-fourth pound of yellow beeswax, then stir in one pound of powdered cantharides until cold. Keep in a tightly closed jar. To strengthen for use on bony growths mix at time of use one dram of biniodide of mercury with two ounces of this stock blister.

Colic

Every horse owner should keep on hand a few drenches for spasmodic (cramp) and flatulent (wind) colic. They may be purchased from the veterinarian or druggist. The farmer cannot, under the provisions of the Harrison Act, buy laudanum, morphine, cannabis Indica, or chloral hydrate, commonly used in such preparations. He can, however, give relief in many cases by use of the following simpler drugs:

Alcohol, brandy, gin and whisky, useful as stimulants in colic, chill and heat exhaustion. Dose ½ to 2 ounces of alcohol; 2 to 8 ounces of the other stimulants.

Aromaic spirits of ammonia. Dose 1 to 8 teaspoonfuls in water as a stimulant and to stop formation of gas. Very useful in colic and in heat exhaustion.

Sulphuric ether. For pain and as a quick diffusible stimulant. Dose 1 to 2 tablespoonfuls in a pint of water. Inflammable. Keep away from an open fire or light. Along with it give, in flatulent colic, 2 to 4 level teaspoonfuls of

Salicylic acid. Excellent when there is fermentation of gas, or give

Soda hyposulphite, 4 to 8 tablespoonfuls dissolved in water before adding ether. With these may be given with good advantage a teaspoonful each of fluid extracts of nux and ginger, and essence of peppermint, or 2 tablespoonfuls of the tinctures.

Turpentine, of which at least a quart should be kept on hand, is useful in colic, 2 to 4 tablespoonfuls being given in 1 to 1½ pints of raw linseed oil. It is most beneficial in wind colic.

Fever

Keep on hand powdered saltpeter to give for fever, founder, lymphangitis (milk leg), and garget. Dose, 1 to 4 teaspoonfuls in water or feed. In founder give 2 to 8 tablespoonfuls 2 or 3 times daily. Veterinarians also give small doses of tincture of aconite. This is a dangerous poison and should have a place only in the medicine chest of an expert.

Indigestion

In addition to destroying worms, having the teeth put in order by a veterinarian, and being more careful in feeding, the following drugs will be found useful:

Chalk. In the powdered or prepared form in 1 teaspoonful to 1 tablespoonful doses for young or old scouring animals. Give in boiled milk or gruel combined with ginger, soda, rhubarb, alum, magnesia, or bismuth in 1 teaspoonful doses. A lump of chalk placed in the calf pen is useful as a preventive of scours.

Charcoal. Powdered wood charcoal may be given freely to any animal that has indigestion. It helps hogs wonderfully, also is useful in wind colic.

Ginger and gentian roots, powdered, are valuable in condition powders and for indigestion, as tonic appetizers. The dose for horses and cattle is 1 to 2 teaspoonfuls. Sheep and hogs take 20 to 60 grains at a dose. The tincture or uid extract also is given in drenches or mixtures of liquid medicines. Dose of fluid extract, 1 teaspoonful; of tincture, 1 to 4 teaspoonfuls.

Lime. Allow hogs free access to slaked lime, wood ashes and charcoal. Give lime water freely in milk to calves or foals suffering from indigestion or scours. Slaked lime also is useful as a drying powder dusted upon the navel or a wound.

Nux vomica (poison). The powdered drug, tincture, or fluid extract may be given in weakness cases, chronic indigestion, constipation, or paralysis, under direction of the veterinarian who may personally prefer to give strychnine, the alkaloid of nux.

Physics

Castor oil. Used chiefly for young animals, especially calves and foals, when constipated, or attacked with scours. Shake up in milk. Dose, calf and foal, ½ to 4 ounces according to age and size. Give an adult horse or cow 12 to 16 ounces as a purgative.

Epsom salts. The most popular purgative for cattle. Does 1 to 2 pounds dissolved in 3 pints of warm water. Add ½ to 1 cupful each of salt and blackstrap molasses. Give very slowly and carefully from a long-necked bottle. Sheep take 2 to 4 ounces in water and hogs the same dose in slop.

Glauber salts (sulphate of soda). A saline purgative used in the same way as epsom salts, but especially valuable when the liver needs stimulating. Full dose for horse or cow 12 to 24 ounces dissolved in 2 or 3 pints of warm water. Alternative dose, for the liver, 2 to 4 ounces once daily.

Linseed oil (raw). Boiled oil is poisonous. Dose for horse and cow 1 to 2 pnits, sheep and swine 4 to 8 tablespoonfuls. The best physic in constipation or stoppage of the bowels. Better than an aloes purgative ball in colic of the horse. Small doses mixed in mash or slop are also useful for relaxing the bowels.

Keep on hand fresh lard, or lanolin, and ½ pint each of fluid extracts of poke root and belladonna. Mix 1 teaspoonful of each of these with 2 tablespoonfuls of lard or lanolin to rub on the udder in garget. In severe cases add 1 teaspoonful of turpentine. Iodine ointment also will be needed for swellings and obstinate sores, and glycerine in which a little tannic acid is mixed for chaps and cracks; or balsom of Peru or compound tincture of benzoin for sores.

Worms

For the destruction of worms in horses will be needed sulphate of iron (copperas), sulphur and salt. Give a level teaspoonful of copperas and 2 each of salt and sulphur night and morning for a week, then stop for ten days, then repeat the treatment. Omit iron for a pregnant mare. Keep gasoline for killing worms of sheep. Turpentine also is useful. It, or copperas, also is given to wormy hogs.

Wounds

The medicine chest should contain, for disinfecting (germ destroying) purposes, a bottle of bichloride of mercury tablets. Directions for use are given upon the label. One pint bottle of carbolic acid in addition to a one-gallon can of coal tar disinfectant, such as zenoleum, kreso, chloronaphtoleum, etc. The coal tar disinfectants have a hundred uses on the farm for wounds and disinfecting purposes. Directions for use are given on the label of the can.

White lotion for wounds is made by mixing 1 ounce of acetate (sugar) of lead, and 6 drams of sulphate of zinc in 1 pint of soft water. Label the bottle "poison," and shake well before use. Always keep lead and zinc on hand for this purpose.

Sulphate of copper (blue stone) also will be needed for dusting on proud flesh and for use in lotions for sores. foul in the foot, foot rot of sheep, and ring worm.

Tincture of iodine must be found in every medicine chest for use on wounds and swellings and for ringworm. The ointment, too, is much used for swellings, garget, and troublesome sores.—A. S. Alexander, M.D.C.

"DRYING OFF" HIGH PRODUCING DAIRY COWS

While some cows dry up too easily, there are others that have the habit of "hanging on" even after the dairymen would have them "let go." The quality of persistency is a fine thing in a dairy animal. Many a cow is unprofitable because she drys up too soon, therefore it is greatly to be prepared to have a cow so persistent in her milk flow that it is with difficulty one is able to dry her up.

In "drying off," one of these difficult cows plenty of time should be allowed for that purpose. It is not possible to manage this matter quickly, with some individuals without injury. Nature's processes are slow and she positively refuses to be hurried. She has her own methods, they are always workable and will succeed if intelligently followed.

The first thing to do in persuading a high producer to "let go" on her lactation period is to shorten up on the food supply. No cow can give milk long without a supply of suitable food hence a ration altogether opposed to milk production should be adopted. Instead of giving succulent food such as grass, ensilage alfalfa,

Dizzy and Faint Spells

Are Warnings of Heart Trouble That Should Be Heeded.

Those feelings of weakness, those dizzy spells and "all gone" sinking sensations, which come over some people from time to time are warnings that must not go unheeded. They indicate an extremely weakened condition of the heart and a disordered state of the nerves.

Those who are wise will start taking Milburn's Heart and Nerve Pills before their case ɔccomes hopeless. They have no equal for strengthening the heart and invigorating the nerves.

Mrs. Emil Brooks, Upper Gagetown, N.B., writes:—"All last summer and winter I had dizzy and weak spells, headaches and fainting and blind spells. A friend recommended Milburn's Heart and Nerve Pills to me. I had only taken two boxes when I found great relief. I highly recommend them to all who suffer from heart trouble."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

roots, etc., and concentrates with a high percentage of protein such as oil meal, cotton seed meal, gluten, bran, oats, etc., a change should be made to timothy hay, straw and food containing less succulence and protein to those with a higher analysis of curbo-hydrates, of course a limited quantity of fattening foods to keep up energy and prevent the cow from falling off in flesh should be given for it is bad policy to allow a cow at this time to get thin. This is her time for building up for the next lactation and if she gets thin now valuable time will be lost and unless a long term from being dry has been in one's mind she will just be able to regain the lost ground and still have time to get in proper condition for freshening.

Another thing that should be carefully guarded against is sudden changes passing from one class of foods to another should be done gradually. If this is not observed there is great danger of bringing on digestive complication or other troubles that can easily be avoided by the exercise of care and reasonable judgment.

Another important matter at this time is the milking, just what to do will depend upon the individuality of the cow under treatment, both as to the quantity and quality of the milk she is giving. If her milk is pretty rich she will have to be milked oftener than would be the case if it were poor, on account of the tendency of the former to get stringy or thick thus interfering with emptying the udder occasionally, as should be done to make sure there is no lump of curdled milk left there to decay and cause inflammation, thus subjecting the whole udder to danger. If a cow's milk is quite thin in butter fat at the time of drying off, quite a large quantity may be left in the udder without much danger of trouble, hence these things should be carefully noted as "drying off" progresses.

A good way is to drop one milking and at the next milk clean. If there are no lumps and the mess is not great enough to cause uneasiness two milkings may then be omitted and again the udder milked clean. If no inflammation occurs and the quantity is gradually growing less the time between milkings may be lengthened after each milking until the cow is fully dry. At each milking, however, the udder should be entirely emptied as it is the only way to be sure that there are no lumps of coagulated milk, stringy cream or inflammation in the udder. If at any time the udder suddenly is found to contain any lumps or other indications that inflammation is present, the cow should be milked twice a day, at least, until these entirely disappear, when the process of drying off may again be continued.

Even after a cow is apparently dry she should not be allowed to go long without a careful examination of her udder being made occasionally, to make sure that all is well. Neglect to observe this precaution has resulted in the loss of many quarters and valuable cows. The cow's udder is a very delicate mechanism and will not stand any considerable amount of abuse, hence great attention should be given it at all times to preserve it in its best form, for if one or two of the quarters are destroyed as the result of carelessness or other forms of abuse it practically means that the animal will have to be sacrificed. The loss of a good cow means a great deal in these days not only to the owner but also to the community in which he lives and the empire also.

Be careful about drying off the cows now, so that when the next freshening occurs all teats and quarters will be in good form for beginning a useful season's operations, not only for the benefit of your pocket but also for the protection of 'Home and Native Land."

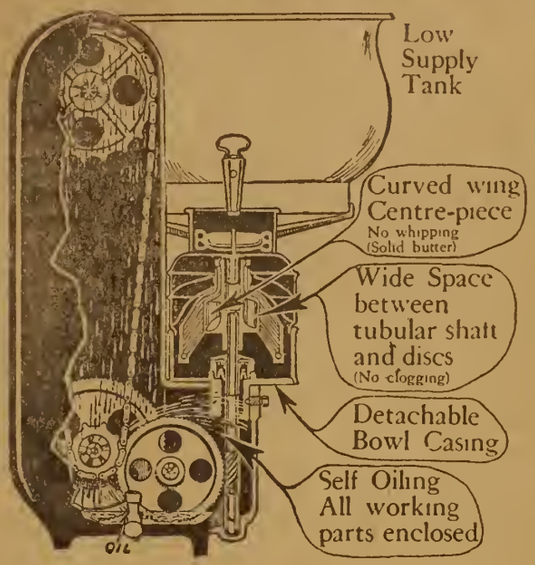
More Cream and Better Quality

The Standard not only skims closer than other machines but it gets the richest, highest quality cream. Ordinary machines will not do both. "During the past two years," writes one of the principal Creameries of Canada, "the **quality of our products has risen** in a surprising way, and we can obtain a **higher price for our butter.** The reason for this is undoubtedly due to the **increase in the number of**

Standard

Cream Separators in use among the dairymen supplying us with cream.

On page eleven of our latest catalogue you will find positive proofs, repeated over and over again, that the Standard skims down to one-tenth pound of butter-fat per 1000 pounds of milk skimmed.



Low Supply Tank
Curved wing Centre-piece
No whipping (Solid butter)
Wide Space between tubular shaft and discs
(No clogging)
Detachable Bowl Casing
Self Oiling All working parts enclosed

There are no milk or cream tubes to clog. The simple Standard bowl can be taken apart and quickly cleaned. The discs do not clog, because there is an extra wide space between the tubular shaft and the discs. The self-oiling system adds to the perfect cleanliness and to the sanitary features of the Standard.

Finally the curved wing bowl centre, an exclusive Standard feature, distributes the milk to the discs evenly and without whipping; the globules of butter-fat remain intact and the result is firmer, superior butter—more profits.

All these splendid advantages; besides many other exclusive features, are fully described in our literature. Write for it today.

THE HORSE

WEANING THE COLT WITHOUT LOSS TO ITS FOAL FLESH

To keep the colt growing without interruption during weaning time and afterward is a most important consideration in producing horses profitably. A good horseman aims to replace the milk that the colt has been accustomed to secure from its mother. He tries also to reduce the worrying and fretting of the colt to a minimum. To wean a colt appears to be a simple matter. It is simple as many do it; yet the very olw degree of success that is shown on many farms by their unthrifty colts is evidence that there is something wrong or that there is something lacking. Often in a few weeks during weaning time the youngster changes from the growing, sleek, milk-fat colt to a stiffhaired and unthrifty, stunted individual. The colt if properly cared for, need lose but little of his flesh, bloom and spirit.

Grain to be Fed

Grain must be used as the milk is taken away. It is necessary that the colt has been taught to eat grain before weaning is attempted. Oats have always been preferred by horsemen for young colts. They are undoubtedly superior to any other single grain. The colt likes a mixture or a variety of grains and will thrive best on such a ration.

Hay should be provided in plenty. Doubtless alfalfa or clover is the most desirable for young growing colts. Both grain and hay should be of the very best quality. If it is at all possible to furnish succulent grass for the colt, it should be done. This is a big factor in preventing any check in the growth of the youngster.

Company of other Colts

Naturally the colt will miss the company of his dam. If he has been accustomed to stay in the stable or yard while the mother is out at work there will be less fretting on that account. If the youngster has followed the dam constantly and has never been kept separated from her, he should be broken gradually to stay away from her if it is at all convenient to do so.

If there are several colts on the farm it is best to wean all of them at the same time. The youngsters love company and if there are two or more of them together they will fret and worry much less.

The stall or pen where the youngster is confined should be such that he cannot injure himself. The door and fence should be high enough so that he will not try to jump out. Nothing but a clean and comfortable place, with plenty of sunshine and proper ventilation, should be used for the colt during weaning time. It should be made possible for the colt to exercise freely every day.

Management of the Dam

Just before weaning it is best to change the dam from succulent pasture to dry feed. If she is being fed grain the amount should be reduced to a minimum. This will have a tendency to reduce the milk flow. The colt should then be allowed to suckle only two or three times per day instead of being with the mother all the time or at least over night. It may be necessary to milk out the mare occasionally for a few days, in the case of large milk produrers and where there is a tendency for the udder to swell. Having done these things it will be lomparatively simple and easy to keep the colt away from the mother entirely without injury or handihap to either the dam or her foal.

Having made the rhange slowly and gradually the youngster will not miss the milk greatly. He wil eat grain and hay, will take exerlise and will grow withoht any setback. If he is kept healthy, thrifty and growthy, the very best of results will follow.

H. E. McCARTNEY.

CARE AND SKILL IN FEEDING HORSES

Some persons feed much more to their horses than others, and get no more work done. Very often the horses fed the heaviest are not worked the hardest, and are not the fattest. One man told recently of changing his way of feeding, and he found that he got better results with a smaller amount of feed.

Feed is so high-priced now that this man found by cutting the amount of grain squarely in two that his horses have done as much field work as ever, and are in as good flesh as usual. His horses eat a little more hay than under the old plan of feeding.

There is such a thing as getting a horse accustoned to eating an exorbitant quantity of feed. The experienced horseman generally detects the symptoms of overfeeding, but a man who habitually feeds and handles only his own horses in his own way may go on for years with a method that is wasteful or even actually injurious to the horses.

Probably it is these differences of management that give some farmers the reputation for continually having bad luck, accidents, colic, and other trouble with their horses, while some of their neighbors never seem to have any unfortunate incidents about their horses. Many farms seldom have a horse sick, sore, or lame. It depends much on the management, and the most important single item is the sensible feeding.

STUNTED WEANLINGS—POOR YEARLINGS

It is a common thing to see yearling colts turned into spring pasture, their stunted condition showing clearly that they have done poorly through the winter, and the retaining of their long winter coats showing that they do not make much use of the pasture until the summer is almost gone. A search for the cause of this condition reveals that their growth is checked when the foal is weaned along about October. As a result of a setback at that time, they are poor eaters during the winter and are stunted when they go out to pasture in the spring.

A little care at weaning time will prevent this trouble and do away with the possibility of a weakened animal later on. If the colts have a small amount of grain to nibble during the summer while they are with their dams, a complete separation will not be likely to cause any serious setback, because they will not miss the milk so much. Most of the trobue, when trouble occurs, is due to the fact that the foal is not accustomed to eating grain.

When ouce separated, the dam and foal need to be kept apart; otherwise, the work will have to be done a second time, and the colt will fret more than at first. Weanlings should be placed in clean, dry well-ventilated quarters, where they cannot injure themselves. A box stall in the barn may be used, if the flies are not bad.

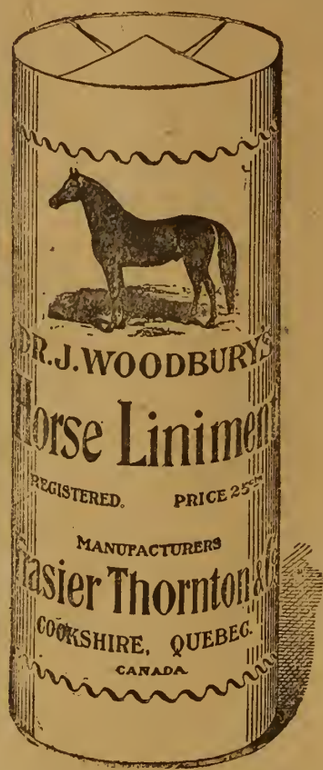
Feeding the weanlings is not a complex problem. Many times the colts do not eat well at first and have poor appetites all through the winter. This may be due to overfeeding at the start, or to using the same feed without any change. They may be started, if they have not been eating grain through the summer, with a few handfuls of crushed oats and bran.

A mixture of four parts of crushed corn, three of bran and one of linseed meal is equally good. Good clover or alfalfa hay, along with clean, pure water, fill out the feer requirements. The bran and alfalfa are valuable because they are ordinarily laxative enough to prevent constipation, a frequent cause of serious trouble at weaning time. Constipation can be relieved by a dose of castor oil or injections of warm water. At the same time reduce the feed; there is a tendency to overfeed, especially if the colts are not used to grain.

Not all the attention is to be given to the foal. The care of the mare is just as important as that of the foal, if her usefulness as a brood mare is to be retained. As soon as the colt is separated from the dam, the amount of grain given the mare is necessarily reduced to check the flow of milk. The udder will need to be partially milked out if it becomes so full that it causes uneasiness or pain. If all the milk is removed, the process of drying up the flow will be much longer. When the udder becomes caked, applications of lard will give relief.

Weaning time had just as well be called training time. "Breaking" is

Dr. J. Woodbury's Horse Liniment
THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.

Newton Lee, Owner "All Right" 5817.
Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

the wrong term, and an unnecessary oen, if the colt is handled before it becomes too old to learn proper stable manners. If the colts have not been haltered, it is time they are taught to lead at the halter and to stand tied in the stall.

DEAL HUMANELY WITH OLD HORSES

One of the vexatious problems that every farmer must solve is how to dispose of the farm horses which have outlived their period of usefulness. Some farmers make it a rule to sell their horses at the age of eight or ten years, and replace them with younger and more vigorous stock. Thus they secure the services of a horse during his best years, and then pass him on to someone who prefers an older and cheaper horse. Obviously, everyone cannot follow this plan, hence it does not solve the problem.

Some one of us may own a horse that was born and raised on the farm, and has been a faithful servant all its days. Perhaps it is the family driving horse, driven by old and young of two or three generations. Such an animal, when his worth is fully appreciated, is regarded almost as highly as a member of the fmily.

It is strange that some men will sell an old horse to some party who will probably overwork and abuse him as long as he is capable of work. If a man owns a horse that is no longer profitable to keep, it is certainly more humane to kill him than to sell hi mto an unkind master. We may be able in some cases, to place an old horse with some one whom we can trust to treat him kindly and feed him well in return for the moderate amount of light work that he can do. But we should be sure that the man is at least fit to associate with the horse!

Probably the best and most humane way to treat a very old horse is to kill him. Winter is coming on, and a horse that is too old to eat and digest his food perfectly must endure much discomfort and sugering before the return of warm weather. He may get down in his stall, and if unable to rise it may be necessary to kill him at last, so why not put him out of the way before he is compelled to endure suffering and pain? A bullet through the brain will kill a horse instantly and painlessly, and an hour or two of work will give him a decent burial. If we are too tender-hearted for this performance—and it is no bad fault if we are—some one can always be found in the neighborhood who is qualified to act in our place.

JOHN MARSH.

HORSESHOEING THAT PREVENTS LAMENESS

Unsoundness among horses can often be prevented by keeping the animal's feet level when shoes ar being put on. In shaping the foot for the shoe the hoof should be shortened to its natural length, and to do this the rasp and not the nippers or a knife should be used. The frog of the foot should not be touched except to trim off the ragged edges. The frog acts the lower surface of the shoe so that it will have a bearing surface. The blacksmith should be instructed not to trim away the bars of the foot as is often done. This results in a contracted hoof and reduces the years of usefulness of the horse.

The principal object of shoeing is to reduce the wear on the hoof, though faults of gait and conformation may be corrected by careful shoeing. The shape of the colt's foot can be greatly changed by proper shoeing. To increase the length of the step the toe should be trimmed rather long. The shoe should be square at the toe and weighed by increasing the thickness of the shoe. To make a horse 'go high' or lift the feet the toe of the shoe should be rounded on the lower outside edge and the heel of the shoe weighted.

"This is the Kind of Horse the Government wants"

No horse with a Spavin, Splint, Ringbone, Curb, Bony Growth, Capped Hock, Wind Puff, Strained Tendon or Sweeney can now pass the keen-eyed Inspectors of the Government Remount Stations.

Splendid-looking Horses—otherwise sound—are being turned down because of some blemish that could be quickly cured with

Gombault's Caustic Balsam

Here is your chance to make money for yourself and at the same time to help in the Government's great Thrift and Production movement.

Put your horse into condition with Gombault's Caustic Balsam. A safe and reliable remedy.

Gombault's Caustic Balsam if applied immediately after burns, bruises or cuts, is a perfect antiseptic—soothing and healing. An absolutely safe, external remedy for man or beast.

Every bottle of **Caustic Balsam** sold will surely give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by parcel post with full directions for its use. Send for descriptive circulars, testimonials, etc.

REMEDIES FOR SADDLE SORES

Four or five remedies are generally used on sore backs. Hydrogen peroxide is seldom necessary unless it is a running sore. Carbolized vaseline is good to soften a scab which is full of dirt or which for some other reason should be washed off. As a rule, once a good scab forms it should be left alone; a sore heals best under a scab. At first, when the sore is raw—and if the horse is being used it is generally raw every time the saddle is removed—healing oil or powder should be applied, either separately or together. The healing oil is composed largely of turpentine; the powder of burnt alum combined with various healing and antiseptic ingredients—carbolic acid, camphor, boric acid and talc. Burnt alum alone is healing and drying. Iodine is also used occasionally. For a sore that is nearly healed or is still tender collodion is often helpful. It toughens the skin and acts as an effectual buffer between the hide and the blanket. If it is necessary to ride the horse it should be applied each time before saddling.

OMAZON

The Canadian Food and Tonic for horses cows, hogs, sheep and fowl, is composed of nourishing ingredients made from medicinal powders and roots constituting the best food and tonic for animals.

Omazon causes the disappearance of all disgust for food, constipation and congestion of the bowels, colics and diarrhoea.

All farmers and breeders should have it at hand.

For sale by all progressive merchants.

POULTRY.

WINTER EGG PRODUCTION INCREASED BY LESSENING WASTE IN GRAIN RATION

If a farmer has a cow which goes dry five months in the year, he gets her off his hands as quickly as he can. If his hens go dry five months in the year he keeps right on throwing high-priced grain into them and waits patiently until they are ready to lay again. If he gave his hens as good winter care as he gave his cows he would get as good, if not better returns from them.

There are times during November, December and January when there are not enough eggs going into the village to supply the local demand, yet during April they come in at the rate of three hundred dozen or more a day. Probably nine out of ten farmers do not expect to get winter eggs, do not even try to get them in spite of the fact that here is the richest poultry harvest of the year. The average farm hen begins to lay about the first or March and keeps it up more or less regularly until the vrst of October. It is doubtful if she lays more than seven dozen eggs during this time, worth, at usual warm weather prices, about $1.40. With grain worth what it is now it costs that much to feed her a year and if she is to show a profit it must be during the other five months.

Where the Profit Comes in

Give her two months to get through the molt and with the right kind of care she should produce at least three dozen eggs during December, January and February, worth forty to sixty cents per dozen, if properly marketed, or thirty to forty cents per dozen if sold in the village. Under the same conditions early hatched pullets should begin to lay in October or November and keep it up all winter.

During the warmer months a hen has a variety of food, fresh air and exercise, which she does not have during the winter, hence the lack of eggs. Give her these and she will lay more profitably in cold weather than in the warm, probably not as many eggs but prices will be two or three times as high. To secure a profitable winter egg yield it does not necessarily follow that she must have more feed than she usually gets but that it must be of a greater variety, thereofer all we get out of her during the winter months is profit. Let us see what we must do to get this profit.

First the henhouse must be given a thorough cleaning, the roof made tight and all cracks in the wall covered. If the windows are filled with glass take out half of them and cover the openings with light muslin or a good grade of cheesecloth. Remember that hens do not require warmth so much as pure air. Cover the floor with at least six inches of clean straw or shredded cord fodder. The latter makes excellent scratching material as it is tough and the hens will eat nearly all the leaves. It is in scratching that they get their exercise so o not fail to give them something to scratch in, removing it as soon as it becomes worn or soiled and replacing with fresh litter.

On the farm it is not difficult to supply the variety of food required. The main ration for winter should be corn at night, all they will eat for it is a long time till morning, and if a little is left they will be scratching for it at daybreak. The breakfast, wheat, oats, buckwheat, or a mixture of these, should be a light meal, not over half as much as they have at night. If they get their fill early in the day they will loaf until they become hungry again, and loafers are not layers. Scatter the grain in the litter so they will have to dig for it, and the colder the weather the more they must scratch to keep warm.

Feeding for Results

Some time during the middle of the day give them all the sprouted oats they will eat up clean. This is the best green food obtainable, but cabbages are a close second, followed by beets, carrots, and alfalfa and clover hay. The wife of a neighboring farmer has one hundred cabbages put away for her hens this winter. She always gets a good winter egg yield and is one of a number of farmers' wives I know who make more off their hens than their husbands do from their hogs. Cabbages and roots should be given early in the day as it requires considerable time and labor to pick them to pieces.

Furnishing Egg-Producing Material.

There is not much egg-making material in the grain and green food, their functions being to sustain life and keep the body in healthy condition. To enable her to produce eggs we must give her something to make them of, food rich in protein and meat of some kind to take the place of the bugs and worms she gathers for herself during the warm weather. The following dry mash not only supplies protein but also adds to the variety of her ration:

Bran 100 lbs.; ground corn and oats 100 lbs.; middlings 50 lbs.; alfalfa meal 50 lbs.; beef scraps 50 lbs.; fine table salt 8 lbs.

Dry beef scraps will replace the insect food and she should have access to it at all times. This is the cheapest egg-making food on the market and if it is necessary to omit either the mash or the meat it is better to leave out the former, provided a variety can be supplied in some other form. Green cut bone is the best meat food to be had, but it is hard to get and if given a chance a hen will eat to much of it.

Other Essentials

We may do all of these things and still not get an egg. This will probably be the case unless we have put ourselves on a friendly footing with the hens. If on cold days they hump up in corners and on the perches and show no interest when we enter the house the nests will be eggless. If they are kept busy during the greater part of the day, if they come running when we open the door, expecting a scramble over a handful of breadcrumbs, a plate of table scraps or an ear of corn, or the delight of scratching in a basket of clover chaff fresh from the barn floor, it is a safe bet that there is something doing in eggs at three, four or five cents each.

Nests, mash hoppers, drinking vessels, etc., should be fifteen to eighteen inches above the floor to leave space clear for scratching purposes and to keep them free from litter. A low, wooden candy tub makes a good drinking vessel for winter. If filled with hot water in the morning it will not become cold until late in the day. Empty it at night and turn it over so it will be free from ice and clean in the morning, and two or three times a week add enough permanganate of potash to color the water red. This not only purifies the vessel but acts as a check toward colds and other sickness.

Provide a Dusting Place

If the house has a board or concrete floor provide a dusting box. Sifted coal ashes make good dusting material and the hen greatly enjoys the little particles of coal she finds in it. Also the coal carries impurities out of her system. Provide oyster shells, grit, too, if you wish it, but if she has plenty of shells she will not care much about grit.

An elaborate poultry house is not needed, though the more convenient the building the easier it is to secure the desired results. Dryness, light and ventilation are the principal requisites. There are many ways not mentioned here to add to the variety of food, hot mashes with cooked vegetables, milk, cottage cheese, stale bread, parings, etc., all of which increase egg production and cut down on the feed bill. But with all these we must keep on visiting terms with our hens so they will come a-running and not go a-running every time we open the door. C. N. WHITTAKER.

PUTTING THE HEN ON WAR RATION

We are warned by the government that there may be a shortage of food the coming winter, due to our pledge to help feed the nations allied with us in the present war. In particular we are urged to be economical in feeding our poultry, and one of the advisers has gone so far as to tell poultrymen to feed more corn and less wheat.

I do not believe I ever did so much thinking, studying and experimenting as I did to get this feeding proposition where I could have the same results at a less cost. Finally, I decided upon what I believe to be a ration that is not only well balanced, but which supplies the needed material to make eggs. My method of feeding follows:

In the morning I feed a mash made up of equal parts, by weight, of wheat bran, corn-meal and meat scrap. To this I add about fifteen per cent. of semi-solid buttermilk. I work this butter-milk thoroughly with dry-mash ingredients until it is evenly distributed, and then I add sufficient water to make the mess moist and crumbly. I never knew my fowls to be so greedy a sthey are when this mash is fed, and it works like a charm. I am getting twenty-five per cent. more eggs than I did at the same time in former years, with hens of the same breed and same age.

I also feed this mash to my growing stock, and the effect upon them is magical. I might add that semi-solid butter-milk is put up in the West, being a by-product of the large creameries in that section, and it is now sold commercially. Where this cannot be had, other milk will act as a substitute, but butter-milk or sour milk is preferred. Of this mash I feed an iron spoonful (equivalent to what could be held in one hand) for every two fowls in the pen. To the growing stock I give about a spoonful in every two or three in the flock.

In the evening I feed a grain mixture composed of whole oats, two parts; cracked corn, two parts; wheat, one part. (All by weight.) This I feed to the laying stock—a handful for each fowl in the pen. For the growing stock I feed a grain mixture composed of equal parts of cracked corn and wheat, allowing a handful for each of the largest (about half-matured) birds, a handful for every two chicks weighing about a pound and a half each, and a handful for every three chicks weighing less than that. The allowance of feed, however, is regulated from time to time according to the appetites of the fowls. What might be right today would not necessarily hold good tomorrow. Appetites change.

In addition to these feeds I give green stuff, such as lawn clippings, vegetable leaves, etc., and when these articles are scarce the stock is fed sprouted oats.

Sprouted oats make a good food in winter, and should be fed daily. Sprouting oats by using hotbeds, employing the same method as used when sprouting in trays, is very good for early spring, summer and fall growing. A very successful way, too, is to use a regular greenhouse. During the winter it is necessary to heat this house either by stove or hot-water pipes.

In sprouting, the oats are soaked overnight in a pailful of water, to which a teaspoonful of formalin has been added to prevent mold. They are then spread out an inch thick on a tray which is provided with drainage, and twice a day are sprinkled with warm water. Stir occasionally until the sprouts start. When three or four inches high they are ready for use. One square inch per hen per day is the amount of sprouted oats usually fed. The sprouting grain is relished by every bird in the flock. Sick gofwls which refuse to eat other feed often will eat the oats greedily.

SMALL VS. LARGE FLOCKS

For years the beginner has been advised to start in the business in a small way. In fact, he has been cautioned to do so that he might increase in knowledge as his plant enlarged. It is not necessary to go over all that again, but more important to take up the methods employed by so many beginners—and not a few others who have been in the business for several years.

It is false economy to have these large families, as has been proved time and again. The most successful poultrymen and poulterers of to-day are of the same opinion.

The arguments used by advocates of large families—50 or more in a flock—are:

1. It saves expense in building.
2. It saves labor in feeding and watering.
3. It saves time.

Grant that there will be less building required, and that time and labor will be saved, the argument in favor of small flocks—not more than 25 head in a pen—means:

1. There will be no crowding and fighting on the roost at night.
2. There will be more exercise taken when the fowls are compelled to remain indoors.
3. There will be less vices, like feather pulling, egg eating, bleeding the male bird's comb, etc.
4. There will be more eggs.
5. There will be better fertility.
6. There will be better health.

Are not such reasons worth more than the expense of extra lumber, extra labor, extra time?

If there is anything wrong with the hens—such like an ailment or droopiness, or an accident—it will be more readily noticed in a small.

In small flocks there is a better chance to see that all the fowls get a proper share of the feed. There

A MESSAGE TO WOMEN!!
LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.
If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:
Mrs. M. Summers, Box 309 Windsor, Ont.

are fewer "bullies" who drive away the more timid hens.

Overcrowded flocks are not the active, energetic hens that are so needed to make profitable egg production. Besides, there cannot be the proper fertility. On farms where there are these large, common flocks, two or more males are allowed with the hens at the same time. Even if these males do not quarrel, they are always interfering with the other's attention to the females. This not only cripples fertility, but is injurious to the hens.

But the greatest viewpoint is that from health. It is a noteworthy fact that the bulk of injuiries that come to the editor, asking for roup, cholera, and other ailment remedies, come from farms upón which it is the custom to have large flocks. At night these birds crowd on the roosts, get close together, and the animal heat make them "sweat." This condition causes an injury when the next morning the hens fly from their roosts and go out to face a temperature many degrees colder than what they had during the night.

For successful work, we repeat, never allow more than 25 fowls in one flock, and the nearer you keep the number to 15, the better will be the returns.

Corn firms the meat.

First grow bone and muscle, and then put on fat.

Close granied poultry are most desirable.

Pure food improves the flavor of the meat.

Pure food poultry are most desirable.

It takes about eight weeks to grow a squab broiler.

Dark pin feathers give a dirty appearance to a dressed carcass.

M. K. BOYER.

CHARCOAL FOR POULTRY

Charcoal seems to worry beginners as well as some experienced poultry raisers. I have heard any number of old breeders say that poutlry would do as well without charcoal as with it, while some write us, "What is it good for and of what benefit is it to fowls?" There is no question but what charcoal prevents noxious gases that form in the digestive organs of fowls.

I have found that charcoal puts new life into a lazy layer, as well as aids every organ which is very likely to be overcome through its contact with impurities. Charcoal cleanses the crop, prevents sour crop, cleanses the intestines, brings about sweetness, and assures purity to decayed and fermented food. It aids the fowl's digestion. I have given it to my fowls constantly for years, and seldom have a fowl die from indigestion; in fact, I cannot recall ever having lost a fowl from indigestion since we began the use of charcoal. When a fowl feeds freely on charcoal, it leaves its roosting room in the morning feeling fine and fresh, while those that are deprived of charcoal and are fed heavily on fat-producing foods, appear stupid, dull and listless, never laying an egg, an eventually dying from an enlarged liver. I never saw a fowl which was fed on charcoal suffer severely with bowel trouble. In fact, it's a wonderful health producer. No poultry keeper can afford to go through the winter without supplying charcoal liberally.—J. C. Clipp, in Exchange.

Pigeon eggs are usually fertile if the pigeons are healthy and properly fed, especially when they have free range. One squab (usually the male) frequently hatches first, and where there are several cases where the squab outgrows its nestmate it may be advisable to sort the squabs in the nests, making the pairs as uniform as possible in size and age. If the parent birds die the squabs may sometimes be removed to a nest where there is only one squab, or they may be fed artificially, although this process takes considerable time.

They all come out of the "BEAVER" FLOUR Barrel

Apple Pie and Hot Rolls for supper—Jelly Roll and Chocolate Cake and delicious homemade Bread for dinner—Puddings and Doughnuts, and Cookies and Raisin Bread—all at their daintiest and best when made of

BEAVER FLOUR

MILLED OF BLENDED WHEAT

"Beaver" Flour is just as good for Pastry as for Bread. It is the product of Ontario winter wheat, blended with western spring wheat to increase the strength. "Beaver" Flour has the best qualities of both kinds of wheat—the whiteness, lightness, delicate flavour and perfect Pastry making qualities of Ontario winter wheat—coupled with the extra strength of western spring wheat. Being scientifically blended in exact proportions, the blended wheats are always the same in strength and quality—and so is the flour.

If you have never tried a blended flour, you cannot imagine what a difference there is between "Beaver" Flour and the usual western spring wheat flours. Get a sack of "Beaver" Flour at your dealer's, and try it for yourself.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

ANNUAL CONVENTION OF THE NEW BRUNSWICK WOMEN'S INSTITUTES

At the fifth annual Convention of the N. B. W. I., 175 members were enrolled for the three days' sessions, with several members coming in for special sessions. This excellent attendance together with the ready willingness on the part of the members to make the Convention a success, resulted in the 1917 Convention being "the best yet."

The sessions were held in the Aberdeen School, Moncton, October 2nd, 3rd and 4th, with Miss Winter, the Supervisor, presiding at the opening session. Miss Winter took this opportunity to give her year's report and brought out the following facts: an increase of 10 new branches since November, 1916; 92 branches at the present time with a membership of 2600; 75 branches from their financial statements from July, 1916 to June, 1917, showed $14.505.61 raised and an expenditure of $11.361.48; an additional sum of $2641.03 recently raised by 71 Institutes and sent to Halifax as a gift from the N. B. Women's Institutes for the Y. M. C. A. War Fund; notwithstanding the demand for patriotic work the Institute continue their interesting monthly programme and devote part of their monies to local improvements, especially schools and public halls; medical inspection, through the efforts of the Institute has been established in two schools; 156 girls and women took advantage of the educational training yiven last winter at the short courses in home economics; the summer of 1917 saw 102 meetings held when special speakers visited the Institutes and delivered lectures on "Women's Responsibilities of Today" and demonstrated the "canning of fruits, vegetables and meat"; the total attendance at these meetings was 4913; at last winter's Apple Show held in St. John, 22 Institutes exhibited 535 jars of fruits and vegetables and the department awarded $50.00 in prizes; at this year's Convention 43 Institutes are exhibiting 469 jars of canned fruits, vegetables and meats, the department giving $101.00 in prizes; for the best aperage attendance of members at meetings and the most carefully planned and carried our programmes, to date from January, 1918 to June 30, 1918, 6 prizes amounting to $90.00 will be distributed to the Institute, also for best written essays on "War Time Thrift and Economy," "Systematic Housekeeping," and "Advantages to a Community of having a Women's Institute," the department will offer 3 prizes on each subject, the money amounting to $66.00, the essays not to exceed 1200 words and to be handed in not later than December 31st, 1917.

The formal opening took place the evening of October 2nd. Following the reading by all the members of a War Time Prayer, especially prepared for the Women's Institute Convention. Mrs. W. A. Ferguson, President of the Moncton branch of the Canadian Red Cross Society, welcomed the delegates to Moncton. Her welcome was brief but to the point and much appreciated by the Institute women. Mrs. C. J. Osman, of Hillsborough, who so ably replied to the Address of Welcome, demonstrated her capability as a public speaker and not a woman present but felt proud that such an intelligent woman as Mrs. Osman had been selected to take this part in the Convention.

Mrs. H. W. Parsons, of Cochrane, Ontario, a woman of much experience in Institute work in Ontario, and especially brought to Moncton to take a conspicuous share in the Convention proceedings, made herself invaluable to every women at the sessions, whether an Institute member or visitor. The addresses which held her audiences from beginning to end were "AWoman's Duty Towards the National Debt," "Child Conservation," "The Girls' Institutes" and "Parliamentary Usage."

The morning session of October 3rd was devoted to branch reports and Five Minute Papers. Possibly, so far as direct help to the Institutes is concerned, this session was the most helpful. An indication of this was the continual jotting down of notes. In the paper "Punctuality" by Miss Celia Peck, President of the Hopewell Hill Institute, Miss Peck said, "Perfection in all things should be the aim of every member of the Women's Institute, and the first step towards that goal is Punctuality. Punctuality represents a great many things, but among them, truthfulness, faith, orderliness and consideration of others." Her final word was. "Let us all, when we return to our home (or better still, now) be resolved never to be late anywhere, and impress it upon those over whom we have control, the necessity of consideration for others in this respect and so cultivate habits that represent the finest of the fine arts,—a beautiful behavior."

"Duties and Privileges of Institute Officers" was the title of the paper read by Mrs. Havelock Coy, Vice President of the Fredericton Institute, who said. "Much of the success of an Institute depends on the personality of the officers, particularly the president. A successful president must possess the quality of leadership and any woman with e desire to be of use may fit herself for the duties of leadership. "Be sure you are right, then go ahead" is an old saying, but one every Institute officer should remember. We need no greater incentive than our motto "For Home and Country" to inspire us to do our best. A good officer should possess a spirit of self-acrifice and be willing to forget pleasure and personal interests when they clash with the performance of duty. Officers should always attend the regular and special meetings of the society and serve whenever possible in any capacity desired by the Institute. They should be filled with a desire to serve the communities in which they live; successful in getting others to work; getting all the members working; giving them responsible places to fill and not trying to do it all themselves. The president should possess executive ability, self control in trying situations, the power to efface herself for the good of the work she represents, good judgment and to treat every member with courtesy and kindness. The president should always be on time, have her program arranged and start the meeting promptly. The business should not be allowed to drag along, but be put through with dispatch, thus leaving time for the presentation of some subject either in the form of a paper or address, or perhaps the conversational method, or reading selections from helpful books along the lines suggested in the hand book. It is the duty of the president to see that the constitution and by laws of the Institute be strictly conformed to and the regulations be observed. The secretary-treasurer and president are members ex officio of all committees and both should be present at all committee meetings if possible. The executive consists of the president, vice president and secretary-treasurer. It is the duty of this executive to carry into effect the business of the Institute as specified by the membership or by the board of directors, but sometimes it is necessary to act when the meeting is very small and the matter urgent, and then the officers are justified in deciding without waiting for further consultation with the directors and membership, particularly if the directors and membership have been notified and failed to come to the meeting."

Mrs. H. McClary, of the Lower Kingsclear Institute concluded her paper on "Letting Our Head Save Our Heels" with these remarks, "If you have a place for everything and insist on things being kept in their places, you can always find anything you want without having to hunt for it."

Miss Charlotte Scovil, secretary of the Queenstown Institute, in dealing with the subject, "The Institute in a Rut," made the following comparison: "It is not the fault of the willing horse that the wagon drops into a rut; it may not be the fault of the unwilling one, but it is the fault of both if they do not get the load out again provided the load is not too heavy. So with Institutes; there are always a willing few, but without the help of every member an Institute cannot help but get in a rut. If each member of the Institute is made to feel that she is positively necessary in the carrying on of the work, there will be no lack of interest."

Another excellent paper on Institute work, prepared by Mrs. A. G. Dickson, vice president of the Centre Nappan Institute, bore the title "Making Institute Work More Effective." Mrs. Dickson said, "I should like to see all members have a chance of presiding at a meeting; it is an education everyone should aim to acquire. For the roll call I might suggest a subject each month, asking all to express a few thoughts on same at next meeting. By this we will have gained two things, induced our members to think and to give expression to their thoughts, thereby gaining confidence and ease and paving the way for greater achievements. Let us have a number of working committees. Let us bring all our home problems to the Institute, such as planning our work, home management, the training of our children and talk them over and I am sure some will be helped. Sound bodies for our boys and girls are as essential as sound minds. In these days when our country is being drained of its population, the subject of caring for the health of our rising generation becomes a very important one. Our Institutes could do no more effective work than by bringing about medical inspection for our schools. To make this work successful we must have medical inspectors appointed and paid by the Government. Our Government appoints inspectors for seeds, for animals, for poultry; surely they can be brought to see the greater importance of safe-guarding the health of the youth of our country. Let us work for this object and not only this generation but those to come will bless the Women's Institutes".

Miss Bessie Fraser's paper on the subject, "When and How to Display the Canadian Flag" was well received. The introduction to her paper was "When we speak of the Canadian flag, we speak of a thing which has no existence. Other parts of the British Empire have adopted and made legal a distinctive flag, but Canada has never done so. By custom, we have come to call the flag of the British Merchant Marine, the red ensign with the Union Jack in the first quarter, the Canadian flag, and have placed our coat of arms in the fly, but no Act of Parliament has made this legal." Her concluding words were, "Let us realize that this flag stands for all that we can love, respect and admire, that wherever it flies, liberty and justice to all is the law and let us say and mean it when we say "We'll never let the old flag fall.' "

Many a society could have profited by the thoroughly businesslike way the session for the morning of October 4th was carried out, under the leadership of Mrs. Parsons.

The following resolutions were moved and carried by the Convention:

WHEREAS, milk is essential to the well-being of the young and growing child, Be it Resolved that the Food Controller so regulate the price and distribution of feed to the farmer to enable him to produce the supply of milk necessary; and further, to regulate the price of milk products to the consumer.

WHEREAS, moving picture shows are chiefly patronized by the young people of the land and that we consider many of the pictures shown most injurious to their moral well-being, it is resolved that a woman be placed on the Provincial Board of Censors.

RESOLVED, that in the opinion of

SUFFERED WITH HACKING COUGH

COULD NOT SLEEP AT NIGHT.

The constant hacking cough that sticks to you in spite of everything you have done to relieve it, is a source of danger. The longer the cough stays, the more serious menace it is to your health.

It is easy to check a cough at the outset with Dr. Wood's Norway Pine Syrup. If you have let it run though, it takes a while longer to cure, but Dr. Wood's Norway Pine Syrup will cure it even then after other remedies have failed.

Mr. J. Henry Landry, South River, Burgeois, N.S., writes:—"I received such great benefit from Dr. Wood's Norway Pine Syrup that I cannot help expressing my thanks. I suffered with a hacking cough for over a month, and could not sleep at night. I used many kinds of remedies, but they didn't do me any good, until I used 'Dr. Wood's,' and found great relief right from the start. I only used two bottles, and was completely cured. I will never be without it as long as I live."

There are a number of substitutes on the market for Dr. Wood's Norway Pine Syrup, so when you ask for it see that it is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c., and that it bears the name, The T. Milburn Co., Limited, Toronto, Ont.

this Convention, medical inspection of schools would be beneficial to the youth of our country, and urge the mothers of our Institute to confer with their local boards to bring about this measure.

RESOLVED, that this Convention recommend to the Provincial Legislature the advisability of making it possible for women, other than rate payers, to become members of our Rural School Boards.

WHEREAS, the members of the Women's Institutes have noted the steps already taken with regard to wheat, be it resolved that other grains for food and feed purposes shall not be used in the making of spirituous liquors during the period of the war.

THAT, WHEREAS, the Women's Institute of New Brunswick are keenly appreciative of the endeavors of Hon. W. J. Hanna in his capacity of Food Controller;

AND WHEREAS, the Women's Institute are the best organized company of women in New Brunswick;

BE It Resolved that the Women's Institute of New Brunswick through its Secretary express to the Controller their sympathy and pledge their hearty support.

RESOLVED, that the Department of Agriculture be asked to co-operate with the University at Fredericton and see if they could issue lending libraries as McGill University does.

RESOLVED, that it is the opinion of this Women's Institute that Women should be appointed on Hospital Boards and Municipal Homes of all cities, towns and municipalities of this Province.

WHEREAS, the nature ofwomen's home life requires them to understand all branches of sanitation, as upon them falls more heavily the evils resulting from public uncleanliness; therefore resolved, that it is the opinion of this Women's Institute that women should be appointed on the various governing bodies of Boards of Health of the Province of New Brunswick.

Mrs. Jean Muldrew, Director of Domestic Economy, office of the Food Controller, Ottawa, delivered an address on "Good Conservation." Not a woman present but felt her responsibility, so effectively did Mrs. Muldrew's message strike home. Mrs. Muldrew, in the absence of Miss McIsaac, Superintendent of the Alberta Women's Institutes, also spoke on the work of the Alberta Women's Institutes, of which she is Assistant Supervisor. Dr. Keirstead of the University of New Brunswick was another speaker on food conservation. He explained the method to be used in the distribution of pledge cards when the Women's Institutes will be asked to cooperate.

One of the most helpful papers of the entire Convention was that read by Mrs. Herbert Reid, President of the Stonehaven W. I. Her subject "Literature for Young People" was so practical, it will be published in full in this journal at a later date.

"The Connecting Links between the Home and the School" brought forth many splendid suggestions. Mrs. James Porter of Andover, the writer of this educational paper, was requested to read it at the Teachers' Institute at Grand Falls, following the Convention.

Rev. G. M. Young, of Fredericton, pointed out in his eloquent address "Reconstruction after the War" that the men in the trenches are enduring hardships for the fragrant home to be. In the days to come we must learn to do better and see that every humble worker gets his fair share. We will need to take knowledge of the labor party in the days to come. The great public utilities must be used for public purposes in the days that will follow the war. Children should be trained so as to render efficient service to the state.

It was regrettable that for the two important subjects included in our programme, "Cheering Our Soldiers," and "Rural and Urban Sanitation" Mrs. E. Atherton Smith, and Dr. W. F. Roberts, M.L.A., both of St. John, found it impossible to attend.

The Institute women will cherish fond memories of the hospitality of Moncton citizens. The afternoon of October 3rd they were entertained to a delightful auto ride around the city and suburbs, followed by a supper served in the basement of the Central Baptist Church.

Totally taken by surprise, Miss Winter, the Supervisor, was made the recipient of a handsome club bag, Mrs. Rainsford Keith of Havelock, making the presentation. Mrs. J. W. V. Lawlor, of St. John, on behalf of the Institute women, presented Mrs. Parsons, who had done so much to contribute to the beneficial side of the Convention, with a beautiful bouquet of roses. Both Miss Winter and Mrs. Parsons made suitable replies.

The branch reports and question box livened up the meetings considerably, and many problems were solved by the question box committee. The branch reports echoed with activity and so numerous were the splendid accounts for home and country, not a woman at the meetings, a member of a Women's Institute, but felt proud of it.

Preceding the auto rides Wednesday afternoon, all assembled in the city hall to hear the judges' verdict as to those Institutes winning prizes in the Canning Competition. Two large stands, running across the centre of the hall, with trimmings of red, white and blue, were well filled with every variety of fruit, vegetable and meat. Many of the jars were sold and the money forwarded to the Institutes, while some branches asked that their exhibits be sent to a Convalescent Home or Hospital to cheer the sick.

Clean Tools Work Better and Last Longer
You bet — it pays in time, money and results to keep all tools clean, bright, free from rust. And Old Dutch does it right.
Old Dutch Cleanser
Chases Dirt

No Advance in 3 Years

With war-time prices so terribly high for nearly every article of food, it must be a particular satisfaction to those who love good coffee to know that there has been no advance in the price of Red Rose Coffee for three years—and the great increase in the sale of Red Rose Coffee this year shows that the price is appreciated.

People everywhere seem to be using much more coffee than they did before.

Red Rose Tea is economical on account of its superior quality—but Red Rose Coffee is economical both on account of its quality and price, a combination hard to maintain in war-time.

WASTE OF MONEY IN BUYING FOODS

By buying more than is necessary of perishable food.

Buying poor materials because they are cheap.

Buying foods out of season, they are very expensive and have not the same flavor or food value and home production is not appreciated when in season, and it teaches people to acquire a craving for foods hard to obtain.

By buying staple things in small amounts when it is cheaper to buy in larger.

Carelessness in keeping supplies after obtained.

Poor cooking meas a loss of food value, the food is less digestible and less attractive.

By carelessly leaving large amounts adhering to dishes.

Serving people more than they can eat.

The need of right buying and right cooking is evident since the body must be kept in repair, making it less susceptible to disease. It is necessary to know the value and understand the composition of our most common foods anyway. The cheapest diet is the one into which cereal grain foods enter most largely, also the cost is greatly increased when shell fish and chicken broilers take the place of dairy products and our ordinary meats.

PUTTING AWAY SUMMER CLOTHES

Since of late years our climate has become so variable, a great many do not pack away summer clothes until about the end of November. Then a time comes when there is little leisure. Fruit and vegetables are all in place, fall housecleaning is done, and there is time to "fuss" over the packing as long as one chooses.

And, right here, it pays to take time over the work. It is necessary to have things come out looking well next spring, and how can they, if tumbled into boxes anyway and jammed away anywhere during four or five months of winter.

Of course cedar chests are the ideal for packing things in, especially for summer when moths run riot. But in winter it does not so much matter. Plenty of boxes and trunks, and a cold attic or other room for storage will supply all necessaries. If each person in the family can have a box for themselves, why all the better; just so much confusion can be saved when this or that garment is needed in the spring. It will be better still if each person can have two boxes, one for fine articles, the other for coarser articles, shoes, slippers etc. And really boxes do not cost very much. Good stout ones with lids can be bought from store keepers for a trifle.

So now the packing itself; in the first place it is absolutely advisable to have everything clean that is put away; and be sure not to lay away anything that has been starched. Wash all the starch out and dry thoroughly ootherwise the garment will turn yellow.

It is also advisable to mend any rips and patch any holes that may have appeared. There is time to do that now, and if there is one thing that is exasperating it is to take out garments in the spring, needed at once for wearing, and find them quite unfit to put on,—a button off here, a hole there, a hem frayed, and so on.

If there are any shirt waists that are too much worn to do duty as shirt waists next summer, keep them out and make them into corset covers. If they are just a little worn about the neck, from wearing stiff collars, cut off the neck band, mark scallops on the edge, buttonhole with floss, and work any little dot or pattern you choose in the scallops. Make the sleeves to match—and presto! a new shirt waist!

If there are any children's dresses that will need lengthening in the spring, do this also before packing the dress away. You can make a very good guess at the length, and so save time in April and May, when housecleaning and gardening are both on with a **rush.**

Fold all garments, do not roll them —and place them flat in the boxes. It is surprising to see how much even a small box will hold. Summer suits and coats should not be packed away; they should be hung up in an out-of-the-way place, on coat and skirt hangers, the coat hangers should be padded to prevent wrinkling of the coat. Brush out every bit of dust from the suit and remove the spots, slipp the coat on the hanger, stuff the sleeves with tissue paper, and put a packing of paper in the front of the coat, buttoning the latter in place. If the place where the suit is to be hung is at all dusty, slip a large bag made of five-cent factory cotton over the whole.

Fancy summer dresses should also be hung up in the same way.

If it is absolutely necessary to pack suits or dresses use plenty of tissue paper for sleeves and soft rolls of it for the folds of the skirt, etc. This will prevent sharp creases. Lay the coat with the fronts on top and button it up over the padding of paper.

Never pack white or light colored materials with white tissue paper, as owing to some chemical used in bleaching it, it is likely to turn them yellow. Use blue tissue paper if possible.

Shoes never should be put away just as they are, if one has not shoe trees for them, one can at least stuff them with paper packed in so tightly that there is no possibility of them getting out of shape and creasing.

Hats too may be kept much more presentable if placed in their boxes on a pad of some sort that will keep the crown from sagging. An invert-

ed strawberry bok padded with paper is good.

Perhaps these little precautions do not seem important, but it is only necessary to try them once to be convinced of their advisability.

LETTING OUR HEAD SAVE OUR HEELS

Written by Mrs. H. McClary of Spring Hill, N. B. Read at the Fifth Annual Convention, N. B. W. I.

Probably most of the women present do their housework, or the best part of it. And, if so, you will know the countless number of steps that have to be taken before that housework is done.

Now, I am going to tell you a few of the things which I have found save me a good many steps and make my work easier.

One of the first things a woman requires in her home, is a bright, cozy kitchen. And one thing which will go far towards brightening that kitchen is a clean stove. Now that is very easy to have. I have found that the stove is far more easily kept clean by doing all my cooking on top of the covers. By this means, the bottoms of pots and pans are never black, and consequently do not require a lot of cleaning. The only utensil I ever put on the flame is the tea kettle and that I never set on top of a cover. You can imagine how much time and labor are saved.

An idea, which I have found very helpful, especially on baking days, is to keep my dishes washed up as I go along. Then, when my cooking is done, I have no table full of dishes to clear away.

Most of the modern kitchens have kitchen cabinets; but a pantry can be made just as convenient. A place can be built in for your flour barrel and sugar, and your bread board and rolling pin can always be kept there. On a shelf just above this should be kept all your spices and flavoring extracts. Although most spices now-a-days come in paper packages or tins, I like labelled glass bottles. You do not need to buy bottles on purpose; I have a number of my spices in Mellin's Food bottles. Sometimes a fruit jar will become cracked. Of course it is no good to hold liquid, but it makes an excellent spice jar. Rice, barley, corn starch, etc., can also be kept in glass jars, conveniently handy.

One, two or maybe three drawers in the pantry are very useful. In one can be kept the knives, forks and spoons, in daily (or almost hourly) use in the kitchen. In another the smaller utensils, such as egg-beater, potato-masher, cake and biscuit cutters, etc. This is much cleaner than having them hanging around on nails collecting dust. In the third drawer can be kept the dish cloths, cup towels, kitchen towels, and bread cloths, and a small roll of clean linen or cotton in case of a cut or burn. Another thing I think worthy of mention, is always to keep adding to your stock of towels, if it is only one at a time.

To return to the kitchen. A long shelf will be found very convenient. In the centre of it place a good, reliable clock. This will save many a trip to another room. Then keep the lamps in daily (or rather nightly) use, at one end of the shelf, and see that they are cleaned, filled and put in place as soon as possible in the morning. Thread, thimble, and clothes brush can have their own places.

Below this shelf can be hung a match-scratcher, pincushion, scissors, buttonhook, almanac and a memorandum pad and pencil, so that you can jot down anything you need from your grocer and other things you might need when you go shopping.

Old newspapers can be used in a dozen different ways; for brushing off the stove, for saving the table when cleaning vegetables, and for setting hot dishes on. Have them in a rack just above the kitchen table, so they can be reached easily. Also, keep a can of Old Dutch or some other good cleanser handy. I find Babbitt's Cleanser an excellent thing for cleaning steel knives and forks, and always keep a can over my sink.

You can save many a hard day's work in Spring and Fall, by always keeping your cellar and shed clear. Don't let rubbish collect. You can always have a barrel or packing box when it is full, have it hauled away.

The same thing can be said of the rest of the house. If you have a place for everything and insist on things being kept in their places, you can always find anything you want without having to hunt for it.

LOST HIS HEAD ALSO

"What happened when you encountered the burglar?"

"He took my breath away."

"Anything else—anything of value?" asked the officer mechanically.

Whipping a Tired Horse Does Not Give Him Strength

YOU may whip a tired horse so that he will win a race or get his load over a bad spot in the road, but that does not add to his strength. In reality it further depletes his reserve of strength and leaves him exhausted.

And so it is with the nerves of the human body. You may by use of stimulants accomplish the work in hand or by deadening the nerves with narcotics you may stop the headaches.

Any temporary relief obtained is won at an enormous expense to the nervous system and you are left more exhausted than ever.

The introduction of Dr. Chase's Nerve Food was revolutionary in the treatment of nervous diseases, because it replaced the old idea of obtaining temporary relief with the new method of reconstructing the starved and depleted nerve cells.

Neither Do Stimulants Restore the Tired, Worn-out Nerves

The Food Cure

Mrs. A. North, Grand Street North, Brantford, Ont., writes: "Both my husband and I can speak very highly of Dr. Chase's Nerve Food, having used it with splendid results. My husband suffered from weakness and a run-down system, and became so bad he finally had to give up work. He also had spells of melancholia. He commenced using Dr. Chase's Nerve Food, and after a treatment of this medicine I never saw such a change in anybody. He is now able to attend to his work, and is enjoying splendid health.

"Before I started taking Dr. Chase's Nerve Food I was troubled with nervousness, sleeplessness and a pain around the heart. The Nerve Food built up my system, made me feel stronger in every way, and relieved me of the annoying symptoms from which I had suffered. We always keep Dr. Chase's Nerve Food in the house ready for use in case it is needed."

A little patience is required to follow out this building-up process, but this is the only way in which disease of the nerves can be really cured. The nerves are starved for proper nourishment. You supply the nutrition in Dr. Chase's Nerve Food. The results are certain, because you are working hand in hand with Nature.

As strength is restored the appetite is sharpened, digestion improves, you get the good of the food you eat, headaches disappear, you find yourself gaining in confidence, in vigor and in energy. You begin to have new ambitions, to enjoy your work and to feel again that life is really worth living.

Dr. Chase's Nerve Food

50 cents a box, a full treatment of 6 boxes for $2.75, at all dealers, or Edmanson, Bates & Co., Limited, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

Butter Parchment at Farmer Office

DO NOT NEGLECT THE EDUCATION OF THE CHILD

The education of the child is one of the most important events in connection with his and her life. Other things being equal the trained mind will succeed over the untrained every time. Every child is justly entitled to a good start in life. It is the duty of the state to see that any boy or girl born under its bag and of whom it expects loyalty should not be handicapped in the race, for want of proper training.

In these days when labor is not equal to the demand and many people are striving to increase their output in production, ac occount of those prices of farm products the tendency is to keep the boy or girl out of school in order to lll the breach. This is usually intended, of course, to be only a temporary expedient; but unfortunately it often becomes a habit and when the least cause presents itself and a little extra help or even a permanent hand is needed, the boy or girl at once becomes the one upon whom the burden falls with the result that too often their education is cut short just at a time when they are taking the greatest interest in their work and when the best use of their time could have been made.

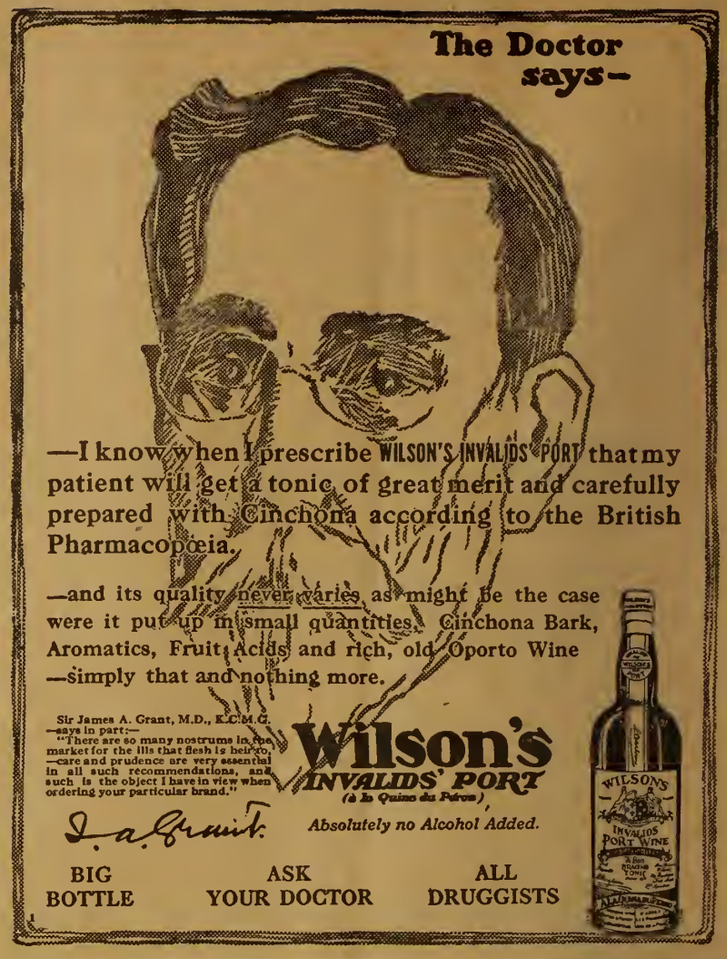
It is important that the work of the farm be done and well done at any time, and particularly important just now in these days when our National as well as our personal safety seems to be hanging in the balance but even with these conditions hovering over us the question of curtailing or cutting off altogether the balance of our children's education and thus putting a handicap upon their chances in life afterward should be a matter of serious consideration before any step is taken in that direction and then only when every other alternotive has proven eneffectual to overcome the difficulties before us.

One of the strongest arguments against beginning a course of restriction on a child's education is the ease with which the practice grows: Having found out from experience that the boy or girl can fill an important place that has become vacant ti seems but a little thing that a day off from school now and then will amount to anything serious, and even if it should, it is likely to be held that an extra month or so, or a year, if necessary, will easily atone for the time that has been lost. The difficulty, however, is that the, month or so, or the extra year never materialies and in many cases the school days of the boy or girl is ended.

Again, once the boy or girl gets behind his class and has to take a lower grade than his former classmates, he or she is likely to become discouraged and lose their taste for an education and even though the parents are willing and anxious that the studies of the boy or girl should be resumed the difficulties in the way are frequently insurmountable and the child's education and mind training so far as his school advantages are concerned practically collapse altogether and the first step in curtailment proves to be the beginning of the end.

It is a well known fact that the "big boy" is usually a failure in the common school and that where other duties so interfere with his early studies that he becomes a "back number," unless possessed of more grit and determination than the average boy, he will go through life with the handicap of his early days resting upon him and from the grip of which he is never able to free himself.

These things are not fancies, nor are they theories; but rather the actual facts as they have been known to work out in the lives of countless number of boys and girls all over the land; hence the great responsibility that rests upon parents and guardians of children should be fully realized and they should squarely face the issue and allow nothing so far as is reasonably within their power to side-track them in giving their children a fair chance to make good in the matter of obtaining a good education.



The Doctor says—
—I know when I prescribe WILSON'S INVALIDS' PORT that my patient will get a tonic of great merit and carefully prepared with Cinchona according to the British Pharmacopœia.
—and its quality never varies as might be the case were it put up in small quantities. Cinchona Bark, Aromatics, Fruit Acids and rich, old Oporto Wine —simply that and nothing more.
Sir James A. Grant, M.D., K.C.M.G. says in part:—
"There are so many nostrums in the market for the ills that flesh is heir to, —care and prudence are very essential in all such recommendations, and such is the object I have in view when ordering your particular brand."

JOHNNYCAKE, A WHEAT SAVER

If we want to do our bit till "Johnny Comes Marching Home" we must eat all the Johnnycake we can and leave the wheat to go over the water. At the same time we must remember that while corn is rich in oil it contains not quite so many mineral salts as wheat.

Therefore, if we confine ourselves exclusively to a corn diet, we must drink plenty of milk with it, and eat a little more heartily of peas and beans.

The Southern army in the American Civil War fought for five years on a corn diet, and it is as good to golf on or hike on as it is to fight on. Here is a good old time recipe for Johnnycake, which, as the old lady who made it said, "tastes like more":

One pint of buttermilk.
One pint of meal (white).
One teaspoonful salt.
Three eggs.
Two tablespoonfuls melted butter.
One light teaspoonful soda.

Beat the eggs together till light, add the buttermilk, and then the meal sifted. Beat well together. Dissolve the soda in two tablespoonfuls of boiling water and add this and the butter and salt to the batter, stirring well together.

Pour into a greased, shallow baking pan and bake in a moderately quick oven for half an hour.

MAKING LAUNDRY SOAP AT HOME

A good grade of laundry soap can be made in the home from drippings, rancid oils, and fats that ordinarily are wasted. Home made laundry soap may be made by using seven pounds of solid fat and one pound of lye dissolved in 11 cups of water.

Clarify and strain the fat and allow to harden. The fat is warmed enough to melt it and the lye solution stirred in until the mixture becomes a creamy mass. It is then poured into moulds to harden. This makes a firm soap for general kitchen use at a small cost.

All small pieces of soap should be saved and kept free from dirt and dust. When a sufficient number has accumulated, it can be made into soap jelly or solution. This can be used for dishwashing, woodwork, soaking clothes, washing flannels—if made from neutral soap—and scrubbing.

One bar of soap or its equivalent in small pieces may be added to two or three quarts of water in the preparation of soap solution. Shave the soap and put into a sauce pan with cold water. Heat vradually for one hour until the soap is dissolved. A tablespoon of ammonia, turpentine, or kerosene may be added, if desired. One bar of soap or the equivalent in small pieces and one quart of water is recommended in the preparation of soap jelly.

A good liquid cleaning and bleaching agent can be made in the home easily by the use of one pound sal soda dissolved in one quart of boiling water and one-fourth pound of chloride of lime added to one quart of cold water. Mix thoroughly. Let stand for several hours. Pour off the clear liquid. Boil and keep in cool place.

SUGGESTIONS ON SUBSTITUTES

No matter what methods of food conservation are employed in any country, it has been proven during wars of far less magnitude than the present conflict that the vast problem of feeding armies and civilians was only solved by an intelligent, individual effort on the part of every man, woman and child.

The Canadian-wide plea at present being sounded from coast to coast is not necessarily an inference that the individual has been wasteful, but it is a clear clarion call for the co-operation of every citizen to conserve food.

The armies and civilian populations of the allied nations overseas need all the wheat, flour, beef and bacon that Canada can supply. And the

plea is that Canada produce all it can, waste nothing, and also shift the consumption as much as it is practicable from wheat, beef and bacon to other foods. These other foods will be just as wholesome, but are not suitable for shipment.

Body-Building Foods

Foods which furnish material to build the body and keep it in repair. Use in each meal at least one of the following:

Lean meat, poultry or fish.

Eggs—in any form.

Milk—whole, sweet, sour, skim or buttermilk.

Cheese—in any form.

Cereals—flours and meals from oats, wheat, corn, rye, and barley in bread and breakfast foods.

Legumes—dried peas and beans.

Nuts.

Well-Balanced Meals

A well-balanced dietary supplies body-building, heat-and-energy-supplying and regulating substances in the right proportion and in sufficient quantity. Simple meals can fulfill all requirements. It is wiser to spread the variety of food over many days than to provide many kinds of food at each meal every day. Here are examples of simple but well-balanced meals:

1. Fruit, oatmeal, and whole milk.
2. Egg, bread and butter, fruit or vegetable.
3. Bread, cheese, tart, fruit.
4. Baked beans, brown bread, apple sauce.
5. Mutton, potatoes, second vegetable, fruit, batter pudding.
6. Milk soup, corn bread and syrup.
7. Whole wheat bread, whole milk, prunes.

These seven meals are not ideal for all ages and conditions, but they meet the needs of healthy, active adults.

SCHOOL LUNCHEONS FOR THE CHILDREN

The task of putting up an appetizing and nourishing lunch is not an easy one unless an interest is taken in it and the value of dicerent foods has been studied.

The most important factor is neatness. No one can relish a dinner which has been hastily thrown into the box and is made up of odds and ends or left-overs. Children envy the child with a neat and attractive-looking lunch box. It stimulates the appetite and makes the cold lunches more desirable.

The large dinner pails or boxes are generally objectionable. Children prefer to carry small ones, therefore it is necessary to economize space. Dishes should be bought which will fit the box so as to take up the least space. Folding drinking cups should be used unless paper cups are found more satisfactory as they taken up less room. Waxed paper is indispensable in a well-made lunch. Rolls of this paper may be found on five or ten cent counters, or still cheaper, it may be saved from breakfast food and cracker boxes. All foods, such as sandwiches, cake, crackers, cookies and cheese, should be wrapped in waxed paper.

Let there be lots of variety in the sandwiches and desserts and always have plenty of fruit. Following are suggestions for a number of lunches which are inexpensive and need but little time to prepare: Salmon sandwiches, cheese, cup custard, fruit, cake and dates. Lettuce sandwiches, boiled eggs, chocolate pudding, oranges, cookies. Graham jelly sandwiches, pressed beef, celery, stewed fruit, pie. Peanut butter sandwiches, ham, bean salad, fruit, cake and figs. Ham sandwiches, pickles, rice custard, fruit, cake and graham crackers.

SUGGESTIONS FOR MOTHER

We are exhorted to use corn-meal in these war times. Here is a good johnnycake, made without eggs: Mix and sift together a cupful each of corn-meal and flour, a third of a cupful of sugar, a teaspoonful of salt and a half teaspoonful each of soda and baking powder. Add gradually a cupful and a half of sour milk. Beat well and bake in a well-lreased, shallow pan in a moderate oven.

Hallowe'en festivities are incomplete without pop-corn. Before popping, put the corn in a colander and plunge it into a pan of water, then drain. The corn will be whiter and better when popped, if this plan is followed. When making pop-corn into balls, have a pan of dry corn and add it to the corn balls as they are being formed. They will look better and form much more easily, as they are not so sticky to work.

Folks think there is nothing quite so good as spiced apple jelly. To make, pare, core and wash the apples, cook until soft and strain. Put into a muslin bag ten sticks of cinnamon bark, eight cloves and six allspice. Drop this into two quarts of the apple-juice and bring slowly to boiling point. Taste this frequently and when the desired spicy flavor has been obtained remove the bag add sugar and proceed as in making other jelly.

A subscriber claims that she is able to make excellent apple butter without long, tiresome stirring. She has a big fifty-pound lard can which, however, has never been used for lard. Into this she puts alternate layers of pared, sliced apples and sugar, about eight pounds of sugar to the canful of apples. Then she puts the lid on tight, stands the can on the stove and listens for it to begin to cook. When she hears the first faint boiling she pushes it back where it will cook very gently and leaves it undisturbed for six or seven hours. The apples will be found a well-cooked mass that keeps well.

Potato omelet is a good supper dish. To make it, cut bacon in slices, then cut in cubes; there should be two-thirds of a cupful. Fry in an omelet pan until crisp and add two cupfuls of cold boiled potatoes cut in dish, one teaspoonful of salt and one-fourth of a teaspoonful of pepper; cook slowly until thoroughly heated. Beat three eggs slightly, add three tablespoonfuls of milk, one-fourth of a teaspoonful of salt and a few grains of pepper. Pour over the potatoes and cook until set. Fold on a hot platter the same as any omelet and garnish with parsley. A good corn-cake is just right to serve with the omelet.

7 Piece Bureau Set 20c.

An Elegant Bureau Set of 7 Pieces in Eyelet Embroidery, consisting of 6 Doilies and a large 18 inch Traycloth to match, all on Fine Quality. Round. Thread Natural Bleached Art Linen, only 20c. Book of latest embroidery designs, containing other Bargains free with order

Why Gold Dust so quickly loosens dirt

DIRT sticks because it is held by grease. But cheer up! "Gold Dust dissolves the grease."

If you want to prove this why don't you try Gold Dust the next time you wash the dishes?

See if you aren't really surprised at the way Gold Dust fairly *slips* the grease off. See if the time saving doesn't gratify you.

Keep right on using Gold Dust wherever you find troublesome dirt. For example in scrubbing the kitchen floor, particularly around the range where some grease may have spilled.

In fact this is a good housekeeping rule: "Use Gold Dust for all dirt that you can't brush up or dust off." And Gold Dust is for sale everywhere in large and small packages.

GOLD DUST

The Busy Cleaner

THE N.K. FAIRBANK COMPANY
LIMITED, MONTREAL

Quality Counts

Quality alone is responsible for the tremendous increase in the quantities of Purity Flour used year by year. This tribute to the supremacy of

PURITY FLOUR

will, we hope, influence you to place a trial order, if you are not already using it.

More Bread and Better Bread---and Better Pastry, too.

3

POULTRY FEED

The question of feed for poultry is becoming serious. Corn is practically off the market, oats high in price, barley and buckwheat very scarce as well as high. Wheat, the most popular poultry feed in Canada at any price, should not, under present conditions, be used for poultry if it is fit for milling purposes, for the prospects are that this year's crop will leave the world's supply of wheat still short and it will be necessary to save all suitable wheat for human consumption. Poultrymen will therefore have to look for a substitute.

Before looking for other grain feeds, it might be advisable to suggest that more mash feeds be used in the ration. During the summer both the chicks and the layers could be fed a larger proportion of dry or moist mash and less grain than is usually advised. Mill feeds such as shorts and bran are easier to get and cheaper than the grain feeds, and when the birds are on range could be eaten in larger proportions.

For the grain part of the ration it might be ecessary to use oats, barley, buckwheat, etc., when these are procurable at reasonable prices. In many places these cannot be obtained; here the screenings from flour mills and elevators should be used.

There are considerable buckwheat screenings procurable at a reasonable price at the prairie and Port Arthur elevators, which make good feed. At the middle eastern flour mills there are quantities of screenings taken from milling wheat that would form almost an ideal grain mixture and could be purchased at about the price of shorts. In fact, most of this class of feed is ground and mixed with the mill feeds and as a consequence is lost as a grain feed for poultry.

Such feeds make very suitable rations especially for growing chicks or for the summer feeding of laying stock and they are much more economical than wheat. In an experiment conducted at the Cap Rouge Experimental station screenings at two-thirds the cost of good wheat produced eggs at less cost than did the wheat. Some of this feed may be fed whole and some ground for a mash.

Samples of feeds and prices in car lots have been submitted which, even with a reasonable commission could be retailed at a comparatively low price. Some of these samples are—Buckwheat screenings, $25.00 per ton at Saskatoon, this is a cracked feed, 96% wild buckwheat and cracked wheat, 4% weed seeds of various kinds. It is a good rearing feed and may be fed whole or ground. Another sample, was quoted at $1.90 per cwt. f. o. b. Toronto; a sample of small wheat with a few oats and a trace of wild buck wheat, price $2.00 per cwt.; two samples somewhat better at $2.10, a good sample of burnt wheat at $2.50 and a better sample at $2.90.

These are all satisfactory feeds and the prices quoted show that compared with wheat they are cheaper. They could be used as whole grain or as a mash feed. In some of them weed seeds will be found, and care must be taken to feed so these will not spread. Local flour mills in Ontario and Quebec submitted all the samples but the wild buckwheat screenings. No doubt, feed of this nature could be secured at any mill making flour, and if poultrymen would ask for it, more of it would be available.

For British Columbia and the Maritime Provinces, the buckwheat screenings seem the best available and a little co-operation might be the means of securing this feed in car lots.

Poultry that has been eating good wheat and corn may not at first take to the screenings, but with a little time ad patience they will eat it readily. A car load of it was received at the Experimental Farm, Ottawa, at a cost of $33.00 a ton. It has proven very satisfactory for growing chicks and for summer feeding of hens. It may not be ideal for litter feeding in the winter, but for fattening and mashed feeds is most satisfactory.

APPLE SYRUP

A cheap and palatable syrup for the table or cooking use may be made in the home with comparatively little trouble, from apple cider.

Directions for making this are given in the Year Book of the Department of Agriculture for 1914, page 230, the essentials of which follow:

Select fresh cider of good quality and to every 7 gallons of cider add 5 ounces of powdered calcium carbonate which can be obtained from any druggist at slight cost. After adding the carbonate stir the mixture well and heat to boiling in porcelain lined kettles not more than two-thirds full. Boil for about 5 minutes, then pour into two-quart jars, galss pitchers, or other glass containers. Set these in pans of hot water to allow slow cooling. As soon as sediment has settled out—this will take 24 hours or more—turn off clear liquid and again heat to boiling in porcelain lined kettles, this time but one-third full. Boil rapidly until liquid has reached about one-seventh of its original volume, and is of the consistency of thin syrup, then cool slowly as before. In a day or so, syrup should be perfectly clear and can then be botteld for future use.—Evelyn G. Halliday, Colorado Agricultural College, Fort Collins, Colo.

"C. V. B." THE CANADIAN ESPERANTO.

By Augustus Bridle

Canada speaks about forty languages. Newspapers are printed in at least twelve of these. No living man in Canada, however great a scholar he may be, can read equally well even, if he can read at all, every one of these newspapers without translation. There are thousands of people in Canada who are unable to communicate with the great mapority of Canadian people by means of any document they can read. With all our melting-pot machinery of commerce and railways and newspapers and colleges and schools and banks and elections, we have never yet designed a document that all people in Canada could be made to understand equally well for all necessary purposes.

But there is a Canadian Esperanto. There never has been one before it. The document conveying this universal language may be signed with all manner of names representing any of the races living in Canada.

The name of this Esperanto document is,

Canadian Victory Bond.

It is quite likely that this document will be signed with names from most of the languages spoken in Canada. What it contains will be understood in all the currencies of all the races we have. The $50 written on the face of it wil lbe translated into £. s. d., into francs, into francs-tireurs, into pfennigs, into whatever stands for the commonest unit of value in languages whose currency would be a puzzle to an average banker.

Once it is explained and signed and delivered, that Canadian Victory Bond becomes a plain passport to any manner of man into financial citizenship. With this document in his hand he knows, whatever language he naturally speaks, that the Government of Canada representing the nation and the resources and the credit of Canada among the peoples of the world, stands ready to pay him $50 plus whatever interest may have been earned on the bond between the time it is sold to him and the date at which he wishes to transform it into cash, if that time should happen to come before the date written on the bond has expired.

No other document has ever done this. Even the Bible is limited in translation to a majority of the languages spoken in this country. The act by which any man or woman gets one of these documents is one which may be impressed on the imagination even more vividly than the voters' list or the lien note on a self-binder or the mortgage on a chattel. Properly understood it means to the man of whatever race-origin possessing it that he has lent as a citizen, $50 to the country whose laws he obeys, whose flag he respects, and whose institutions enable him to live.

One of Robert J. C. Stead's recent poems called The Mixer, variously describing the peoples whom Canada is assimilating says in one stanza:

"They are coming from the valley,
from the prairie, from the hill,
They are coming from the 'May I' to
the country of 'I WILL'!
And for some the smart of failure,
and for some achievement's
crown;
As I roll 'em out Canadians—all but
the yellow and the brown."

In this case even the poet with his universal ideas is outdone by the Esperanto of the war bond. The Canadian Victory Bond invites even the yellow man and the brown man to put down their names.

STARCH CONTENT NOT ONLY REQUIREMENT OF POTATO SUBSTITUTE

Rice and other cereals, and cereal preparations such as macaroni, have come to be referred to as "potato substitutes." In so far as we are concerned with the starch content, the foods named may be so regarded. Their inadequacy in other respects should be as well understood.

In the digestion of foods there are set free alkaline salts known as base-producing elements, and acid-producing elements. The perfect combination of foods is that in which there is at least enough of the base-forming elements to neutralize the amount of acid-producing elements set free, thus changing them to harmless compounds which the body them thorws off. A familiar illustration of such an ideal combination is the serving of potatoes with meat. In an average serving of meat the excess of acid-producing elements is neutralized by the excess of base-producing elements in an average serving of potatoes. It is an interesting fact that an excess of foods of the base-producing type is not in any sense objectionable. Such an excess of acid production is harmful because the natural reaction of the blood and other body fluids is alkaline. Among the plant foods conspicuous for the extent of their use and which contain an excess of acid-producing elements are rice and other cereals and cereal preparations such as macaroni and hominy. Acid producers include meats, fish and eggs from among animal foods.

Base-producers are fruits, vegetables and milk. That fruits have an acid taste but are regarded as base-producing foods may seem paradoxical. It is, then, obvious that while among fruits and vegetables there may be quite free substitution, yet rice which contains an excess of acid-producing elements cannot take the place of the potato which gives rise to base-producing elements. The substitution of rice, because of its starch content, must be accompanied by the addition of succulent vegetables.—Inga M. K. Allison, State Agricultural College, Fort Collins, Colorado.

KEEPING APPLES

The keeping of apples in good condition is entirely a matter of environment, and if the querist had given particulars as to how the fruit has been stored in the past, it might have been possible to definitely point out wherein the surroundings were unsuitable. Both Tolmans and Russets should keep well into April and May, and I find no difficulty in so doing. I have even kept Wealthy, a variety whose season ends in January, into May, though of course the flavor was somewhat off. The fact that the querist's apples shrink shows that his cellar is too warm and dry, thus causing the natural moisture to evaporate from the fruit. Thus, a cellar with a furnace therein would be a very unsuitable place for fruit storage. Apples keep best when placed in barrels as soon as picked and cooled off; the barrels heads may then be laid on, or, better, two or three thicknesses of newspaper, which will keep more or less air from the fruit and prevent evaporation. Apples in bins will also keep longer if covered with newspaper, old bags or carpet. The cellar should be kept as cool as possible, and with this object I do not close the windows until very cold weather is due, while those on the south side are left open a week or so longer. If, about the time the snow melts in spring, you search under the apple trees, you will probably find a few fruits safely tucked away under leaves, grass, etc., as firm as when they were upon the tree. They have been cool and moist all winter, and this fact give us a hint as to what conditions are requisite for their good keeping.—F. R. R.

WORMS IN HORSES

There are numerous useful vermifuges and blood tonics. The most convenient and effectual is the following: 1 drachm sulphate of iron, 1 drachm tartar emetic, 2 drachms linseed meal, mix together and give as one dose, repeating night and morning for a week. Give it in grain feed. After the powders are finished give a purgative of oil and turpentine as follows: 1 ounce spirits of turpentine and 1 pint raw linseed oil, mixed together. After three weeks, repeat the entire treatment, to catch the young worms previously left in the bowels in the form of nits or eggs, and which have hatched since.

THE EFFICIENT HEN

Then hen is an economical transformer of food into a finished product. A hen laying 200 eggs in a year is not at all unusual. A four pound hen laying this number will produce six times her weight in eggs. To do this she will require from seventy to eighty pounds of food. To acquire success it is necessary:—

1. That the food be properly selected.
2. Tat it be fed in correct proportion and in a judicious manner in order that her digestive organs may be kept in good condition.
3. That she be fed enough so that she bas plenty of surplus for egg production.

Feeds are scarce and high in price. If your live stock are properly housed and their comforts properly attended to, they will not require so much food to keep them in good condition. A few hours spent in attending to necessary repairs to buildings, in the way of banking to keep cold drafts from getting under the floors, dusting and washing the windows and replacing broken panes and closing openings that admit too much cold, will be time and money well spent. The merciful man is merciful to bis beast. No merciful man should rest comfortably until he knows that the dumb brutes of which he has the oversight, are comfortably housed, bedded, watered and fed.

Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 23. SUSSEX, NEW BRUNSWICK, DECEMBER 4, 1917. Number 5.

An Imminent War Time Condition

The Maritime Provinces Must Bread Themselves and Produce Surplus if Possible

Men, munitions and money, we are told, are the three main factors that will ultimately decide whether Great Britain and her Allies come out of the present gigantic struggle in which they are engaged with victory perched on their banners or crest fallen with defeat. In other words the nation that can best uniformly maintain these three factors the longest, is bound to be the nation that will triumph in the end.

When the worst comes to the worst, a nation may say to a man "Go fight" and he must go. The nation may also say "Give" and men must give. Many lines of munition can be speeded up at short notice and an adequate supply may be thus maintained.

But want of "food" the main and most essential of all munitions. To increase the food supply, preparation must be made many months before the harvested product is needed for consumption. The land must be plowed, cultivated, fertilized and seeded. Then comes first the blade and after many days the full corn in the ear, and the proverbial bread cast upon the waters returns a manifold yield.

In the line of food supplies, grains, fats and sugar are the essential and most urgently needed for the sustenance of our armies in training, and in the field, as well as the masses of munition workers and others who are not producers of food.

Of the food supplies mentioned in the foregoing paragraph, the farmers of the Maritime Provinces can lend a hand in conserving and production of grains and fats, and of these two, grain is the most urgently needed and it in turn is the one that requires the longest time to prepare for an increase. The first grain commodity for consideration must be wheat, the predominant bread grain. From a European bread-stuff point of view the other cereals are substitutes to be used in mixing with wheat, and a certain amount of wheat is essential. Herbert Hoover, the United States Food Administrator has compiled statistics which show the wheat situation in France, Italy, the United Kingdom and Belgium to be as follows:—

Total yearly pre-war importations	380,804,000 Bus.
Total average production	590,685,000 Bus.
Total estimated production for 1917	393,770,000 Bus.
1917 deficiency	196,905,000 Bus.
Total imports required to maintain normal consumption	577,709,000 Bus.

The total export surplus of wheat from the 1917 sowing in Canada and the United States is only 230,000,000 bushels.

In order that England and her Allies may be adequately supplied with wheat, they must necessarily import and shipping must be available to transport it. The world's shipping is, however, already too short to afford sufficient tonnage to traverse the longer routes to India, Australia and Argentina, which routes require three times the time of the one to North America, and thus three times as many ships to transport the same quantity. Furthermore, the American route is the best protected.

While our ship building may in time overcome the destruction, in the meantime ships must be diverted from the longer to shorter routes to fill the gaps made by submarines.

The Mother Country and her Allies, therefore, look to Canada and the United States for the major portion of their wheat supply, but Canada and the United States supplies, upon a normal export basis, approximately 330,000,000 bushels short of the Allied needs. This shortage may however, be lessened by economy on the part of our citizens through the use of wheat substitute and an honest effort on the part of the farmers to increase wheat production.

Mr. Hanna said at a recent conference with the Ontario Department of Agriculture in Toronto, "I want to tell you gentlemen today, that food is being sent across the Atlantic regardless of the fact that in eight months from now the people of the United States and Canada, should the war go on—and there is nothing to indicate that it will not—the people of the United States and Canada will be on rations, whether they like it or not, and no one will object if rations will save the situation the suffering that is today indicated by the conditions across the sea."

This is a true state of affairs. What will our New Brunswick farmers do to relieve the situation? Concerted action is immediately needed.

The Maritime Provinces are flour importing provinces despite the fact that wheat can be grown successfully in every one of their counties. Many of our farmers have found it more profitable to grow other crops and purchase their flour requirements. The time has now come when the question of profit must take a secondary position to that of necessity. We have no assurance that in order to supply more urgent needs, an embargo may not be placed on the shipping of wheat or flour to provinces that can to a certain extent "bread themselves", if they do not put forth an honest effort regardless of cost.

The word "cost" must never figure in the prosecution of the present crisis to a successful outcome for England and her Allies. It has already cost many of our homes the blood of their manhood. Shall the farmers of the province not rally to the call by producing more wheat and thus help to diminish the quantity we must purchase from the great wheat fields of the west. Every bushel of wheat that the West can thus save for export across the Atlantic will be an extra bomb thrown into the camps of our enemies. The 1917 season was not favorable to the best results in wheat growing in the Province of New Brunswick and consequently many farmers who gave wheat growing a trial did not realize the results they anticipated. Our failure does not by any means spell defeat, and it is an incumbent duty on every farmer in the Province, to grow as big an average of wheat as he possibly can in 1918. The farmers can only do a part and if they do that part well, Providence will do the rest. Farmers who wish to win the war will do their utmost along the lines suggested, and consequently there will be a demand for large quantities of seed wheat for use next spring.

N. B. Municipal Councillors Confer With Their Dept. of Agriculture

Anticipating this demand, Hon. J. F. Tweeddale, New Brunswick's Minister of Agriculture, called a meeting of the municipal county councillors of the Province in the Government Building, Fredericton, on November 20th, to place the matter fairly before them and invite their assistance by using their efficient organization in ascertaining the quantities of home grown wheat seed that is available, the quantities that must be imported to supply the demand and in the distribution of the supply in such a way that every honest effort put forth by our farmers will be helped.

There is no organization in the Province that so thoroughly covers every district as does the Municipal Council.

The response to the call was very encouraging. Councillors representing many districts of the Province received an insight into the seriousness of the situation. Many of them did not realize before coming to the meeting that the demand was so urgent, and openly expressed themselves as being heartily in accord with the steps the Department of Agriculture has taken, not from the political standpoint, but purely and simply as a pressing need that must be attended to without delay.

Mr. Carter, Chief Superintendent for Education for the province was present and offered the Department of Agriculture and the Municipal Councils every possible assistance through the agency of the various teachers, pupils and officers of the schools in the province, a propostion which was readily accepted. The plan of campaign will necessarily require publicity in order to bring the seriousness and urgency of the situation to the attention of every farmer. The press will be asked to co-operate in this work. Circulars explaining the situation will be placed in every home, and the clergy of all denominations have already expressed their willingness to give the matter all the publicity they can.

A blank form will be placed in the hands of every farmer, who will be expected to fill it in and return it to the Secretary of School Trustees, school teachers, or councillors for his district. This blank form will contain questions to the home supply of seed wheat and the quantity that must be purchased to supply the demand.

Premier Foster attended the meeting and took an active part in the discussions; the following resolution was carried unanimously:—

WHEREAS the supporting of the soldiers fighting in the trenches is paramount

AND WHEREAS the necessary support must be forwarded to the wives and families of the soldiers drafted in the Allied Nations,

AND WHEREAS wheat and fats must be supplied by Canada, and in view of the fact that a great shortage of wheat is likely to ensue.

Therefore, be it resolved, that we, the representative of the Municipal Councils, do hereby pledge ourselves to urge our respective Municipal Councils to take immediate action in ascertaining the acreage and the amount of seed wheat needed, for such acreage to be sown during the spring of 1918.

And further resolved, that we will recommend to our respective Municipal Councils the favorable consideration of financing the purchase and distribution of said seed grain.

And further resolved, that we will, within fifteen days from date, ascertain and furnish the Provincial Department of Agriculture an estimated quantity of seed required for said acreage in the respective parishes.

Moved by P. S. Melanson. Seconded by J. W. Smith.

Carried.

The N. B. Legislature at the last session, anticipating such need placed upon the statute books, an act whereby municipalities were empowered through temporary loans, to provide food, fuel, seed or other necessities. The City of St. John has already availed themselves of this and coal was purchased, and delivered in small quantities where required. The Department of Agriculture will locate and secure the necessary supply of seed grain and then it can be delivered to the municipalities in car load lots at cost, and be distributed according to regulations arranged.

Farmers who have a supply of good

(Continued on page 156)

Finishing Lambs for the Block

By E. S. Archibald, Dominion Animal Husbandman

No branch of farming offers better inducements than that of sheep raising, and no other class of live stock will make greater profits. Markets for lambs, mutton, and wool are high, and will remain so for many years. With lambs selling at $9 to $11 per cwt. live weight in the fall and from $12 to $15 in the late winter, a large profit is assured. Add to this wool (unwashed) seeling at 58 cents to 68 cents per pound, and sheep raising becomes the most profitable farm industry. There is every possibility for the intelligent farmer to establish a flock even at present prices and make 50 to 75 per cent net profit per annum on his investment. There are, however, many possible means of losses, such as light lamb crops, heavy mortality in lambs and ewes, feed waste, lamb stunting, intestinal parasites, and many similar troubles which, in the case of the careless or indifferent shepherd, will convert these large profits into an even greater loss. One of the most common losses to the farmer is due to improper marketing. Only well-finished lambs can top the markets and bring the maximum profit.

On the Dominion Experimental Farms some interesting results have been obtained from a number of experiments in lamb feeding conducted during the last few years.

The large percentage of Canadian lambs are marketed in the fall direct from the pastures, which is undoubtedly the most profitable practice, providing the lambs are well finished on grass alone or on an added grain ration. All the lambs from the farmer's flock are usually lifted at the same time, which means that the well-finished lambs of good weight must help to sell the light, thin lambs, which may be as well bred but, being late lambs or twin lambs, have not done as well as their flock mates. Well finished lambs of uniform weight invariably command a higher price than mixed lambs varying in size, weight and finish; hence it is always more profitable to hold the lighter lambs and sell only those of uniform weight and finish. Again, the selling of the most of our Canadian lambs during the fall months practically always causes a slump in price. Lambs not required for immediate consumption are held in cold storage to the profit of the wholesaler in view of the usual increase in price of from $1 to $3 per hundred pounds between the months of November and April.

When the farmer appreciates these two conditions, the lamb trade will be revolutionized and the farmer will finish his work and reap full profits for foodstuffs consumed by, and labour expended on, his sheep. Many farmers, with abundance of roughage, can well afford to finish from one to three carloads of lambs during the winter months, thereby making top market prices on the farm produce and a good margin of profit in addition. Realizing the existense of such conditions all over the Dominion, a large amount of investigational work along these lines has been conducted on the Dominion Experimental Farms throughout Canada. Details of this work may be seen in the annual reports; however, a brief summary of the work to date may be timely.

. Profits in Winter Feeding Lambs .

Profits in Winter Feeding Lambs

In the seven years' work conducted on the Experimental Farms system, the profits on the winter finishing of lambs have ranged from 25 cents per head to $3.82 per head over the cost of feed. In other words, the Experimental Farms and Stations have purchased unfinished lambs on the open market or from drovers and, after charging good prices for marketable farm feeds and cost prices for other roughages, have made from 3 to 33 per cent on the investment in the lambs, labour not included. Even allowing a fair margin for labour, this is as profitable a line of feeding work as can be carried on, and shows a return on investment greater than is usual in the finishing of steers or shoats.

The sex of lambs to finish for the block is at this stage of the sheep industry in Canada a most important consideration. Owing to the great scarcity of breeding ewes and the immediate needs of enlarging the output of the sheep industry, **all ewe lambs fit for breeding purposes should be saved** and held over for breeding when shearlings. Aside from being a national duty, this is also an excellent investment, and is appreciated as such by the farmer.

All good pure-bred ram lambs are in great demand, and should be used as breeders. All inferior pure-bred rams and all grade ram lambs shou'd be castrated early and finished for the block. The high-class market always discriminates against unaltered ram lambs and against undocked lambs. The wise feeder also realizes that greater and cheaper gains follow these two necessary simple operations.

The class of lamb to buy depends largely on the lambs available, and market requirements. Usually, the well-bred lamb showing plenty of constitution and thrift and weighing from 60 to 80 pounds is the best stocker lamb to put into winter quarters.

Lambs weighing from 80 to 100 pounds, if thin, may be profitably put in the feed lot for a short finish, and if good fall pastures are available this may be as profitable a line of work as any. The finished, heavy lamb weighing from 80 to 110 pounds should never be purchased for feeding purposes. The time when greatest profits can be made in purchasing lambs is usually between the months of August and November. However, the condition of the pastures and of the lambs themselves, as well as the markets, will regulate the time for purchase. **The proper time to sell the lambs is when they are finished,** whether this be November or April or any intervenin gmonth. This applies also to the selling of lambs off grass. Finished lambs will make small gains at a very high cost per pound, which cost will usually be far in excess of the market price at that season. In addition to this, the markets are demanding a well-finished lamb, not overdone, and ranging from 85 to 105 pounds live weight, depending upon the breed and season of the year. This, of course, does not apply to the young-lamb trade of the spring and early summer.

The following table shows the average profits over the cost of feed in the feeding of lambs on the Experimental Farms throughout Canada during the past seven years:—

AVERAGE PROFITS IN WINTER LAMB FEEDING

Experimental Farm at	Number of years	Weight of lambs when put in feed lot	Buying price per cwt.	Selling price per cwt.	Spread between buying and selling prices	Profit over feed per lamb
		Lb.	$ cts.	$ cts.	$ cts.	$ cts.
Ottawa, Ont.....	5	99	6 65	8 25	1 60	1 38
Charlottetown, P.E.I...	5	63	5 57	7 85	2 28	1 22
Nappan, N. S.....	3	84	5 80	7 83	2 03	0 90
*Lennoxville, Que.....	1	90	6 00	9 00	3 00	1 65
Indian Head, Sask.....	1	70	6 00	6 00	....	0 34
Lethbridge, Alta.....	5	69	5 65	7 67	2 01	1 35
Average	3	79	5 79	7 50	1 71	1 05

* Most of the lambs at this Stati on finished on pasture.

This table shows an average profit over feed—on Experimental Farms and Stations throughout Canada, in the feeding of many carloads of lambs—of $1.15 per lamb when the spread between buying and selling prices is approximately $2.10. Since the spread between buying and selling prires has exceeded this amount during the past two years, and promises a still further rise during the next two years, one is safe in anticipating a reasonable profit in lamb finishing, in spite of the very high price of lamb at the present time. If this applies to the purchasing of stocker lambs for winter feeding, it would apply doubly to the farmer or shepherd having lambs in an unfinished condition. It is always profitable to finish lambs before putting them on the market.

Feeds for Winter Lamb Finishing

The selection of feeds for winter use should be to replace good pasture grass in every way possible. Grass is the ideal ration for sheep, not only in cheapness but also in nutrition, palatability, and succulence.

A large number of feeds have been tried in this work, and these may be briefly treated under the four headings: dry roughages, succulent roughages, grains, and mill feeds.

Of the dry roughages, alfalfa hay is an easy leader, closely followed, however, by fine clover hays and fine mixed hays. At the Experimental Station, Lethbridge, Alta., it has been found that alfalfa hay, when properly fed with succulent roughages and grain, is worth $21 per ton for the finishing of lambs. It has also been found that alfalfa hay alone or with meal is less profitable than when succulent roughages, such as roots (turnips and mangels) or green oat sheaves, are also fed. What applies to the rich alfalfa hay also holds true with clover hays. Good quality clover hay is worth from 10 to 50 per cent more in lamb feeding than timothy or similar grass hays. Proving the value of succulent roughages, it was found also that good quality timothy hay plus mangels gave from 15 to 20 per cent more profitable gains than clover hay alone. A hay made from peas and oats, well cured, will produce satisfactory gains, but at least 10 per cent less profitable than alfalfa or clover or a mixture of these with oat sheaves.

Fine corn stover will also make profitable gains, but there is a large percentage of waste. However, a small amount may be fed satisfactorily as a supplement to good quality leguminous or grass hay. Coarse hays commonly found in marsh lands are approximately 50 per cent less valuable in lamb finishing than good quality timothy hay, and approximately 60 to 75 per cent less efficient than clover or alfalfa hay. A limited amount of straw may be fed satisfactorily in finishing lambs, but this should only be as a supplement to rlover hay and roots. Generally speaking, the richer the hay and the better it is cured, the more profits will be made in feeding it to lambs. Coarse, dry roughages of any sort are less palatable, more wasteful and less profitable than are the finer feeds of the same varieties.

Succulent roughages play a very large part in profits from lamb finishing. Generally speaking, good succulent roughages, such as turnips, mangels, sugar beets, corn ensilage, pea and oat ensilage, or the like, make the dry roughages and grains more palatable and more digestible. Again, these succulent roughages are cheaply grown and are rich, nutritious foods in themselves. Where corn ensilage may be raised for $2 per ton it is the cheapest and best succulent roughage for lamb finishing. When fed with clover hay and grain it will produce 5 per cent greater profits than a mixture of turnips, clover hay, and grain. However, a mixture of turnips and ensilage with hay and grain will usually give greatest profits. The turnip is the safest root to feed in finishing lambs, particularly where wethers or even ram lambs may be found in the pens. Mangels, particularly, may have a dangerous influence on the kidneys of wethers and rams.

The grains which may be most profitably fed vary considerably from year to year with the market values of those grains commonly found in Canada. Oats, barley, and feed wheat are all excellent grains for lamb finishing, nd may be fed whole or crushed, but never fine-ground. A mixture of these three will usually give much better results than any one grain singly. Corn is another grain which excels in the fattening of lambs, particularly those requiring only a short finish. Corn-fed lambs on the Central Experimental Farm have reached a profit of $2 per head, making great gains at a reasonable cost. However, at the present market prices corn would not be profitable for this purpose. Elevator screenings also are very valuable in lamb finishing, varying in value, however. In direct proportion to the variation in the quality o fthe screenings. Where there is a high percentage of broken kernels of wheat and barley and oats, screenings may have a good value almost equal to a mixture of barley, oats, and wheat. Elevator screenings containing a high percentage of black-seeds and foreign matter have less feeding value. Screenings with dirt and black seeds screened out give the greatest gains and profits. A mixture of whole screenings with barley and oats has given from 10 to 40 per cent greater profits than the screenings alone, the variation being due to the varying quality of the screenings. Black-seeds alone are most unpalatable and are dangerous to feed, in that a large proportion of the feed will pass through the lambs in an undigested condition and will again germinate on the land. Black-seeds fed alone are unprofitable, and the lambs will make small gains if compelled to depend on this feed for their sustenance.

It is doubtful if, under average conditions any high percentage of mill feeds can be fed profitably in lamb finishing. However, where grains are very expensive the following meals may be profitably used: Bran is an excellent addition to a grain mixture, especially in the absence, or partial absence, of succulent feed: linseed oil cake might often be profitably added to the grain ration to put a final finish on the lambs; gluten meal is even superior to the linseed oil cake; cottonseed, when not exceeding 10 per cent of the ration, may often be a profitable addition to the grain ration; middlings, shorts, and fine-ground grains are of a pasty nature when moist, and should not be fed.

Briefly to summarize the feeds, one might say that the character and quantities of feeds depend largely upon market conditions and feeds available. A ration including some good succulent roughage and properly balanced as to nutritive contents will almost invariably give greatest profits. Generally speaking, it will not pay to

exceed 1¼ pounds of grain per lamb at the finish, nor will it be profitable to feed more than 5 pounds of succulent roughage and 3 to 5 pounds of dry roughage per head per day at any time during the finishing period.

Cost of Equipment

The cost of equipment for the finishing of lambs is very light. Warm quarters are not necessary for sheep of any class. Sheltered sleeping quarters, free from draughts and having a dry floor, are usually all that is required. A good, tight, single-board shed with doors opening to the south or, for the Prairie Provinces, a straw shelter or even the protection of the winter feeding. No other class of bush or the straw stacks, would, under average conditions, be ample for this purpose. Cheap, convenient racks and troughs, or a combination rack and trough, will cost little per carload of lambs fed and, if made portable, may be used for both summer and stock requires so little in cost of equipment, in buildings, utensils, preparation of feeds, or in any other way as do sheep. In these days when labour is extremely scarce, this phase of animal husbandry should appeal strongly to the farmer who has not sufficient labour to go into dairy husbandry, swine, or even beef cattle.

N.B. Agricultural Societies United in Annual Session

The 1917 annual meeting of the New Brunswick Agricultural Societies United was held in the Provincial Government rooms, St. John, on Thursday, November 22nd at 2.30 p.m.

B. M. Shaw, the president of the Association, occupied the chair.

The various officers of the Association were present, excepting Secretary Stanley Wilson, who was unable to attend owing to serious illness in his home. K. M. Fiske, B. S. A., Florenceville, was appointed secretary pro tem.

H. B. Durost, who was appointed manager for the receiving of orders, purchasing and distribution of chemicals, at a special meeting of the Board of Directors several months ago, read the minutes and the financial and auditors statements.

The attendance was not very large and did not by any means represent the number of agricultural societies that purchase fertilizing chemicals through the Association. This is a matter that the rank and file of farmers who profit by the co-operative purchasing of their fertilizer requirements should see to it, that their respective Agricultural Societies are represented at the annual meetings of the Association.

The Association is saving thousands of dollars each year for the fertilizer users of the province, and consequently the burden and heat of the day should not be left on the shoulders of a few men who have taken a keen interest in the organization and upbuilding of this worthy Association.

Societies that have not yet followed the practice of purchasing the fertilizer requirements of their members co-operatively, are missing one of the greatest opportunities to be of a real live benefit to their respective communities.

The home mixing of chemicals for fertilizing purposes is no new fangled idea—the system has been tried, proved and found equal to every claim made for it.

Any Agricultural Society interested in the question of fertilizers may procure all the information they require by writing the Superintendent of Agricultural Societies, Department of Agriculture, Fredericton; J. D. McKenna, Sussex, the Secretary-Treasurer of the Association, or H. B. Durost, Woodstock, N. B.

Orders for large quantities of chemicals have already been placed, and in some instances the goods have already been delivered.

The finances of the Association are in good shape, a balance of $757.16 being reported.

The election of officers resulted as follows:—

President—W. H. Moore, Scotch Lake; Vice-President—C. M. Shaw, Hartland; Secretary-Treasurer—J. D. McKenna, Sussex. The other members of the Board of Directors are Stanley Wilson, Rolling Dam; Boy K. Merritt, Moores' Mills; R. J. Huggard, Norton and Roy McCain, Florenceville.

The By-Laws of the Association were read section by sectino.

It was agreed to hold the annual meetings in future in Fredericton, instead of St. John, and that the Directors be paid their transportation, hotel expenses and an allowance of $3.00 per day while attending meetings of the Association.

Home-Grown vs Commercial Seed of Field Roots

One of the reasons why root seed growing has not been practised to any extent in Canada before, is the rather widely spread idea that Canadian climatic conditions are not as favourable to the production of high class seed as are the conditions in in those European countries upon which Canada has relied in the past for her seed supply. In other words, the European countries have been supposed by virtue of more suitable soil and climatic conditions to be capable of raising seed producing larger root crops of higher quality than Canada ever could be expected to do. A similar conception is also very common in the United States. Such a conception has no foundation an dis entirely wrong.

Experiments, conducted the last few years by the Experimental Farms System all over the Dominion, most conclusively prove that Canadian grown seed in no respect is inferior to imported seed. On the contrary, it produces better crops than does imported seed. In support of tihs statement the results obtained in 1916 with home-grown seed of varieties of mangels and swede turnips in comparison with imported seed of the same varieties may briefly be summarized.

Mammoth Long Red Mangel seed, raised at the Central Experimental Farm, Ottawa, in 1915 produced a root crop in 1916 which averaged, when tested at nine of the Dominion Experimental Stations, over two and four-fifths tons more to the acre than imported seed of the same variety. Mammoth Long Red Mangel seed grown at Charlottetown, P. E. I., was tested at Charlottetown and Ottawa and produced about half a ton of roots more to the acre than imported seed of the same variety, and this in spite of the fact that the Charlottetown seed was harvested under most unfavourable conditions. Seed of the same variety, raised at Kentville, N. S., gave a root crop at that Station which exceeded the crop realized from the imported seed by close to three and a half tons to the acre.

Yellow Intermediate mangel seed, originated at Ottawa, was tested at seven Experimental Stations and produced, on the average, 3 tons 750 pounds more roots to the acre than imported seed; seed of the same variety raised at Charlottetown, P. E. I. tested at six Stations yielded an average of one ton and three quarters to the acre in excess of imported seed.

Daniel Sludstrup Mangel seed, raised at Agassiz, B. C.; Kentville, N. S.; and Charlottetown, P. E. I. respectively was leading on the average, about half a ton to the acre in comparative tests with imported seed of the same variety, conducted on a number of Stations.

Kangaroo Swede Turnip seed, raised at Fredericton, N. B. and tested at five Experimental Stations in Eastern Canada, gave an average yield of two tons nd three quarters in excess of the imported seed, grown in comparison with it.

It is rather obvious, from these figures, that there is no foundation whatsoever for the conception that European-grown seed of field roots is superior to Canadian grown. On the contrary, the figures furnish a strong argument in favour of Canadian-grown seed being used in preference to imported seed. It is true that in some instances the imported seed produced yields only slightly behind those of Canadian seed, but what is of real importance is this: In so single case did the Canadian grown seed fall behind in yielding capacity, the same variety of European seed. This is the more encouraging as in most cases the Canadian seed was raised from roots, a great percentage of which would, under no circumstances, have been accepted by European growers as fit for secd production.

Under the circumstances there seems no reason why Canada should, in the future, rely on foreign countries for her root seed supply. There is an opening, now, for a new agricultural industry and, indeed, it is believed that the development and firm establishment of that industry will bring unthought of advantages to Canadian farming in general.

The Food Service Pledge is in the first instance a call upon the people of Canada to assist in curtailing the consumption of beef, bacon and wheat products for the sake of our own soldiers and our Allies overseas.

The Agricultural Valae of Ground Limestone

The favourable influence of available lime on soil fertility is a well established fact and one that is now widely recognized by farmers. This conclusion is the result of practical experience in many parts of the world and is fully supported by scientific testimony. Many soils are naturally well supplied with lime—present as carbonate of lime—and such soils rationally treated in respect to manuring, cultivation, drainage and rotation of crops, are among the most productive known to agriculture. On the other hand, there are other soils deficient in lime, owing to the poverty in lime of the rocks from which they were originally derived or to depletion through long continued cropping and drainage. It is those soils that profitably respond to liming or application of ground limestone.

Soils in need of liming are usually acid or sour and will turn blue litmus paper red (Methods for testing soils are given in Bulletin No. 80, "Lime in Agriculture," Experimental Farm Series). Soils containing a sufficiency of available lime turn red litmus paper blue and usually give a more or less strong effervescence on the addition of a few drops of any strong acid. Soils of all types may be benefited by liming—heavy clays, silty and slaty soils, mucks and light loams and, especially, poorly draine dsoils.

Though quicklime or slaked lime are forms particularly valuable for heavy clays, chiefly from their beneficial effect on the texture or tilth of these soils, improving their drainage and rendering them mellower and more easily worked, ground or crushed limestone has proven a most suitable and profitable form of lime for application to soils of many types and is to be generally recommended. Excessive applications can do no harm as may be the case with quicklime. Dressings may be from two to five tons per acre, broadcasted on the prepared soil and harrowed in.

Experiments conducted by the Division of Chemistry of the Experimental Farms in Eastern Canada during the past five years have shown that at many points an application of ground limestone has been followed by increased yields, and particularly has been valuable for the clover crop—the establishment of which may be considered as the basis of profitable farming. The following two instances illustrate the benefit that may be derived from ground limestone applied to soils deficient in lime.

In Experiment III at Kentville, N. S. on a sandy loam soil, a plot was treated to 215 pounds of fish scrap, 233 pounds of acid phosphate and 100 pounds of muriate of potash per acre in preparation for an oat crop in the year 1914 and yielded 57.3 bushels of grain. Another plot, similarly fertilized, received ground limestone at the rate of 2000 pounds per acre, and yielded 66.2 bushels of grain per acre—an increase of 8.9 bushels of grain due to the liming. In the second year (1915) of the rotation the fertilized but unlimed plot produced 2 tons, 467½ pounds of clover and timothy hay per acre, while the fertilized and limed plot yielded 3 tons, 760 pounds of hay per acre, an increase of 1 ton, 192½ pounds due to the liming. In the fall of 1915 the strong growth of clover aftermath on the limited plot made it stand out in striking contrast to the others in the series.

At Cap Rouge, P. Q., on a sandy soil, areas in barley, oats, wheat and peas were treated in 1915, to an application of two tons of ground limestone per acre. The following results were obtained, the prduce being expressed in pounds of grain harvested per acre. Barley: average of 3 varieties, limed 3900, unlimed 945. Oats: average of 5 varieties, limed 4200, unlimed 3315. Peas: average of 4 varieties, limed 7080, unlimed 3495.

In New Brunswick sections where there are limestone deposits, the farmers would be well advised to ascertain the calcium carborate content, and if the percentage warrants, they may procure the services of the Government Lime Stone Pulverized and thus be able to procure their supply of ground limestone at a nominal cost.

"Waste not, want not," is an old maxim, never truer than it is today.

"Hanna's at the window binding vouse," chirped the facetious chap when he spotted the food controller's pledge card hanging on the front curtain.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

WHEAT PRODUCTION IN THE MARITIME PROVINCES

Probably in no other instance has the increased cost of foodstuffs been more generally felt than in the cost of flour, a commodity which must be used to a very large extent in every household. In fact, with the exception of potatoes, it is the principal staple food of the whole community. In years gone by the farmers of this province grew all the wheat which was necessary to supply its inhabitants, and had a surplus for export; but the opening up of the western prairies, with their vast stores of virgin soil wealth, and the other facilities which were available for the growing of wheat, resulted in the prodution of such immense quantities of that grain that eastern farmers found it cheaper to buy their flour than to grow it, with the result that planting was discontinued and wheat became almost a forgotten crop in the Maritime Provinces.

The war has, however, brought about such a change in conditions as to demand a radical change in practice. Canada now has not only to provide the flour to feed her own people, but she has to do the lion's share in providing for the needs of the British and Allied armies at the front. The output of the western wheat fields is insufficient for both these purposes, and, unless some of the people of these provinces are to go short on breadstuffs, our farmers will have to take hold of the situation, and go back to their wheat growing. There is no reason why they should not; it is a paying crop.

That, however, is not the big end of the question, which is, that unless more wheat is grown here there is going to oe a famine in the near future. The first consideration must necessarily oe the constant provision of an ample supply of food for the boys at the front. We at home can put up with other and bulkier foods, which cannot be transported overseas with the readiness that flour can; besides, there are not the facilities at the front for dealing with these bulkier foods. By the time the needs of the army are provided for, there will only remain less than three-fourths of the quantity normally required for consumption in Canada, and the Maritime Provinces, being furthest away from the producing points, stand less chance of getting their requirements supplied than toose nearer. The only remedy is to produce what wheat we want right here at home. We can do it quite readily if we want to.

We feel sure that the urgency of the matter needs only to be brought to the attention of the farmers of these provinces for them to get to work to remedy it. There is no more patriotic body in the whole Dominion than the farmers of the Maritime Provinces, and when the true state of affairs is laid before them, and it is pointed out to them what they can do to relieve the situation, they will surely do it. Every farmer must grow some wheat; if those who have not been growing wheat at all will sow only two or three acres, if the man who has grown two acres will grow five, and the man who has grown five acres will grow ten, the combined result will be astonishing, and there will be no fear of any shortage. If every one makes up his mind to "do his bit" towards an increased wheat crop, there will be plenty for all.

It may be urged that wheat is a plant that requires a very careful preparation of the soil, and many farmers have not got their cultivation sufficiently forward this fall for it. There is no farmer in the province who did not grow potatoes and roots this year, and there is no finer seed bed for wheat than land which has just produced these crops. A thorough discing and harrowing as soon as the land can be worked in the spring, with some slag or other phosphatic fertilizer broadcasted, will provide as suitable a seed bed as can be asked for. The Agricultural Departments are arranging for a supply of seed grain, both wheat and oats, so there should be no difficulty on that score. All that is needed is a desire on the part of the farmers to relieve the situation; the rest is easy.

It must be admitted that it is not particularly to the credit of a great agricultural community like the Maritime Provinces that their people should be dependent upon outside sources for the supply of such a necessary of life as flour. If it was something we could do without there would be a very substantial reason for our farmers refusing to grow it; but as long as we have to have bread we ought at least to be self-supporting in the matter of providing the wheat out of which to make it. Scores of farmers in Eastern Canade "bread" themselves, and many more could do likewise.

REGULATIONS WILL PRESS HEAVILY ON OLEOMARGARINE

Further regulations regarding oleomargarine are worthy of nothing short of praise. By making the change, the Government gives ground for the hope that the laws regulating this imitation butter may yet prove adequate to protect the dairy industry from undue hardship.

It has been announced that licenses will be issued to be effective on December 10.

One complaint of dairymen has been that while white oleomargarine is sold, it is accompanied by a capsule of coloring matter, and then the colored stuff is palmed off in boarding honses and sheap hotels as genuine—if rather unpalatable—butter. But a change in the regulations reads that "no substance intended for the coloring of oleomargarine shall be imported into Canada in packages containing oleomargarine, and no manufacturer, wholesale dealer or retailer dealing in oleomargarine shall deal in, sell or give away any substance intended for coloring oleomargarine."

It appears as though the substitute were to be almost "regulated" out of existence before it starts—and this is as it should be. Oleoamrgarine may be sold only in original packages. Small packages must be wrapped separately, and on each label or wrapper "oleomargarine" must be printed or marked as the most conspicuous ford. The name and address of the manufacturer, together with the official inspection mark of the country of origin, must appear on all labels, wrappers and packages.

And a minimum fine has been set, as well as the maximum of $500. The penalty for violation of any of the regulations is a fine of not less than $50, nor more than $500, or imprisonment for a term not exceeding six months, or both fine and imprisonment.

Details of enforcement of the regulations appear to have been shifted from the Food Controller to the Health of Animals Branch of the Department of Agriculture—which will also go far to create confidence.

If the reguations are lived up to, we will be disposed to congratulate whoever is responsible for making the best of a bad job—a very bad job.

SIGNING THE FOOD PLEDGE

Ninety per cent of the food consumed in Canada passes through the hands of our women. There is, then a great responsibility resting upon them to conserve supplies needed overseas and to utilize perishable foods. Waste in all its many forms should be regarded not only as a sin, but as actual disloyalty in war time. It is important that sufficient and nourishing food should be provided, suited to the needs of the idfferent members of the family.

Arbitrary rules in this case are of little value, but the principle is of general application—that the women in the homes can do no more important patriotic service than by guarding against waste. The question of substitution is very largely in their hands. A little saving in every home, when multiplied by all the homes in the Dominion, would mean a very large amount of food product saved for the soldiers.

You may feel that you do not need to sign the Food pledge—that you will save all you can without it. But how about your neighbor? The actual pledge may help her to remember the duty of food service. The housewives of Canada, pledged to food service, an dliving up to their pledges, will be a powerful factor in the struggle against Germany and against starvation.

FEED THE SOIL

As we all know, it is from the soil that the tree gets most of its strength and nourishment. It is the soil that supplies the three principal elements of plant food, namely, nitrogen, phosphoric acid and potash. There are three parts to the tree—root, stem and leaves. The root takes food and drink from the soil, the stem or trunk carries what the roots have absorbed from the soil up to the leaves, which act for the trees much as the stomach and lungs do for the animal; that is, the leaves digest the food and take carbon from the air. This should make it clear why the orchardist should cultivate and fertilize the soil for his trees.

FARM WORKSHOP CAN UTILIZE MANY WINTER SPARE HOURS

The farmer who has a workshop even though it be only an old building, perhaps 9 by 10, or less, in size, in which he has placed the old heater, no longer useful in the home, and wherein is an improvised bench and vise, a forge and anvil and some small tools has an advantage, the worth of which can not easily be estimated. The equipment for the shop consists of tools the farmer needs. They are hammers, saws, files, planes, chisels, bits, drills, pliers, pinchers, wrenches, bolts, nails, staples, straps, etc.

The tools may be placed in a rack against the wall over the bench. In boxes under the bench may be found old bolts nd nuts, rods, broken parts of machinery, old iron of various sorts and description, pieces of broken chains, straps and many things so often seen hanging on fences or in trees o farms—a real junk pile. But many of these things come in good play, if one cares to take care of them. While the wintry blasts are howling 'round and the blizzard is wrecking vengeance, the farmer can fire up the old heater, set the forge aglowing, and after the "clinkity, clinkity" of the anvil has told of his whereabouts for a few hours, he may surprise himself with the articles he has made. He can become blacksmith, wagon-maker, harness-maker, carpenter for the time and save some money. He can make open links, rings, clevises and hooks. He has not had time to take the old wagon, which he uses about the farm, to the shop in town, but now he can try his skill on sand board, hound or bolster.

He broke a singletree last fall. He needs a plough doubletree and a jockey stick. Let him try his hand. One of his check lines is partly broken, the stitches are broken, leaving only the rivets holding. It has worried him not a little while driving his spirited, prancing young team. He can become harness maker for a time. Then again, his harness is rusty and dusty; a coat of grease won't hurt them. Now while he cannot use them is a good time to make some neighbors think he has a new set of harness.

When he put his implements in the shed there were some nuts missing. Hunt out of the box of old bolts and nuts some that will fit and replace the lost ones. Now is a good time and the shop is a good place to make ready these things.

Again be his work shop ever so small he can find room for many of his small tools, such as loose singletrees, chains, hoes, spud, sheep shears, clippers, corn knives, etc. It is so much better should he have to leave his team standing in the field and hurry for a hammer, wrench, bolt or nut, to go direct to the shop, pick up what he wants and hurry back to his work than to go to the barn, then to the corn crib, and then remember than he left the wrench on a corner of the fence over on the far side of the south field and have to go over there searching for it. A place for everything and everything in its place is a splendid rule.

Much time may be saved by having a shop and keeping it in order, time saved by not having to hunt for things, time saved by not having to drive two or three miles to town, money saved by having a shop. Every farmer may not be a mechanic but he can make almost anything the farmer needs, in a rough way at least, that will be as strong and durable as though made by a professional.

It is a pleasure to have a shop. It is a pleasure to be able to send the little boy to the shop for a clevis, to be able to tell him just where it is, or for a bolt and be able to tell him just where to find it. In short, it is a pleasure to have a place in the shop for everything and know that everything is in its place. It is a pleasure to be able to make and mend necessary pieces of machinery or tools on the farm.

For mending shoes, there is needed a good cobbler's outfit of such tools as the stand and lasts, shoe knife, shoe hammer, pinchers, thread, needles and clinch nails. To mend harness there is needed a sewing clamp, leather, rivets, etc. As time passes and one becomes quite expert in mending things and making many farm necessities, he can add new tools as he finds use for them.

For shop work one finds use for many little things he can get at the hardware store. There should be many bolts, different in lengths and sizes, an assortment of screws, all sized nails, braces, rivets and tacks, assorted lengths of clinch nails, shoewax, thread, andpaper and so forth and so on.

It will pay any farmer, no difference how rich and well fixed, if he has boys, to look into this proposition of putting up a farm work shop. Then, too, he can while away many hurs himself very pleasantly when he finds time dragging.

ANTHRACNOSE, A DESTRUCTIVE DISEASE OF BEANS AND PEAS

Maritime Province farmers put forth a special effort in 1917 to increase bean production. Their efforts were generally satisfactory. Farmers and others who only grew small quantities in previous years, have, during the past season, grown sufficient for the needs of their immediate families, and some will have a handsome surplus fgor sale.

Anthracnose, or pod spot, was the most destructive disease they had to contend and consequently they will be interested in the following advice from the Experimental Farmer of Canada.

Among the diseases of the garden bean and pea, anthracnose or pod spot is the most destructive.

The disease disfigures the pods by dark brown spots, but also occurs on the leaves and stems of these plants, where, however, the symptoms of disease are less conspicuous.

The disease is caused by the fungus **Colletotrichum** in the bean and by **Ascochyta** and **Septoria** in the pea.

Once the disease becomes noticed in the crop, there is no practical methof of preventing its spread.

These anthracnose diseases are conveyed to a crop by the use of infected seed. Infected bean and pea seeds are found among practically all seed merchants' stock. On the seeds, the seeds, the disease manifests itself by more or less prominent, brownish discolorations, very noticeable on the white-seeded varieties. When very prominent the affected seeds may easily be separated from sound ones by hand picking; this will reduce the disease to some extent, but will not control it completely, since it is very difficult to detect those infected seeds which show very little discoloration, and some seeds which are sufficiently infected to propagate the disease, will always find their way into the soil.

It is best to grow one's own seed supply. When the crop is entirely free from the disease it is an easy matter to gather disease free seed, but when the disease is present, care must be taken to collect for seed only such pods as are perfectly ound. These pods should be picked off and stored in cotton (flour) bags away from any infected material. The disease, notwithstanding these precautions, may become prevalent again in the succeeding crop and it is, therefore, necessary to watch the crop from the day the first seedlings appear above ground. The diseased plants generally show seed leaves either brownish-streaked, or of a very distinct pale yellow colour; when the latter is the case, the disease generally is present on the stem. When these signs are noticed prompt action is necessary. Each diseased or sickly-looking plant hould be pulled up, root and all, and be deposited in a paper bag, not thrown on the ground among the other plants. The hand which has pulled up the diseased plant should then be dipped into a pail containing a 2% solution of formalin to cleanse it from adhering spores. This will prevent the infection from spreading to any sound plant touched after pulling up a diseased one. When all plants have been collected in the paper bag, burn it, contents and all.

In this manner, a small plot may be kept quite free from disease and will produce a fine stock of sound seed. It is preferable to have such seed plot some good distance away from one's ordinary bean or pea plot.

SAVE THE LEAVES—DON'T BURN THEM

The annual job of raking up and burning the leaves on the lawn is being performed at the present time, and thereby much vegetable matter that might be of value later is being destroyed. While the amount of plant food materials contained in leaves is small, yet the vegetable matter of which they are composed is valuable when incorporated with soil in that it improves the physical condition and increases the water holding capacity of such soils.

If the leaves can be piled in a pen in the back yard, mixed with other rubbish and kept moist, in the course of a few months, they mill have rotted sufficiently to be mixed in the soils in the vegetable garden, and flower beds or to be used in mixing soils for potted plants, etc. During the process of rotting they should be turned occasionally as this causes them to rot somewhat faster. Such material is valuable for mixing (not in too large proportions) with heavy clay soils in order to make them lighter and more easily worked.

MORE BACON PRODUCTION NEEDED

We appeal to Maritime formers, as a patriotic duty, to raise as many pigs as possible during the next twelve months. The food situation in France and Great Britain is exceedingly urgent, and there is on espcial call for bacon supplies.

Figures carefully prepared some months ago showed that the European swine population had decreased since the war began by over 32 million head, or 13 times as many pigs as there are in all of Canada. This is in addition to an equally striking decrease in cattle and sheep. And the figures are mounting every week. A few days ago bacon was selling in London, England, for 60 cents per pound.

While no formal pledge as to future prices of live hogs has been made by the Dominion Government, there is a practical certainty of high figures for a long time to come. In the United States the Food Controller has pledged the Government's moral support of a price at Chicago not lower than about $15.50. It is, indeed, almost certain that this figure will on the average be exceeded. These figures will permit of profitable hog feeding even at considerably higher prices for feeds than prevail at present. But even though grains and feeds should go yet higher than they are now, and even though the feeding of grain to hogs should, in itself, entail no profit but rather an actual monetary loss, any farmer growing his own feed could still very well afford to accept the profits that his hogs would yield him.

But, quite aside from profits, I wish to make my appeal on Patriotic grounds. The shortage of bacon supplies in France is now, and will be, very severe. The question of food is a question of life or death.

The Manitoba Government is setting the example by breeding a largely increased number of sows on each of the farms in connection with the various provincial institutions. It would seem to us, too, to be a safe and patriotic act for every Maritime farmer to follow the example.

Every Maritime farmer will know just at what time of year he wishes his litter to arrive. It may be pointed out that sows bred during the first week in January would farrow shortly after the middle of April, the period of pregnancy being about 112 days. Let every farmer breed his sows to suit his own requirements.

The main points are as follows:—

1. The meat shortage of the Allies is acute.
2. No other class of animal so lends itself to a rapid increase as the hog.
3. The price of pork is certain to be very high.
4. By immediate decision and action enough sows can be bred to double, treble, or even quadruple the Maritime Provinces pork production in 1918.
5. By sowing the proper kinds of forage next spring, summer feeding need not be all on dry grains.

USE OF STRAW FOR MANURE

Both wheat straw and bean straw are capable of supplying considerable manurial value. If either are used for manure without first feeding them, or without first rotting them, it is necessary to apply them to the land with care in order not to get too heavy a dressing. Too large a dressing of dry, unrotted straw, whether of wheat or beans, will likely cause firing in the following crop.

Bean straw, coming fro ma leguminous crop, is more valuable pound for pound than wheat straw. Either of these straws used for manure should be applied to the land rather thinly and then pulverized as much as is possible by farm methods, which can best be done by double disking. The disking will chop either straw into small pieces an mix it fairly well with the ooil. This method will get the greatest manurial value of the straw.

U. S. POTATO GRADES

Two standard grades for potatoes have just been recommended by the United States Food Administration and the United States Department of Agriculture. Results of field tests in grading and packing and of experiments in marketing graded and ungraded potatoes, show that marketing potatoes by graes is desirable, practical and economical.

Further, it has been ruled by the Federal Reserve Board that "potatoes, properly graded and packed and stored in a weatherproof and responsible warehouse, as evidenced by its receipt, would undoubtedly constitute a readily marketable, nonperishable staple."

The present prospect of a very large crop of potatoes, the food supply situation, the overtaxed transportation facilities, and the ruling that federal reserve banks may make loans against potatoes properly stored in approved warehouses, emphasize, says the Department, the importance of adopting uniform grades.

Grades Recommended

The No. 1 grade shall consist of sound potatoes of similar varietal characteristics, which are practically free from dirt or other foreign matter, cuts, scab, blight, dry rot, and damage caused by disease, insects, or mechanical means. The minimum diameter of potatoes of the round varieties shall be one and seven-eighths inches, an dof potatoes of the long varieties, one and three-fourths inches.

The No. 2 grade shall consist of potatoes of similar varietal characteristics, which are practically free from frost injury and decay, and which are free from serious damage caused by dirt or other foreign matter, sunburn, second growth, cuts, scab, blight, dry rot, or other disease, insects, or mechanical means. The minimum diameter shall be one and one-half inches.

CLIMATE OF THE SOIL

Land drainage is too often looked upon merely as a means of getting rid of a lot of stanidng water. Everybody knows that as soon as we begin to cut ditches through the swamps and lay tile the swamps disappear, the bullrushes die, the frogs move to other quarters, and we begin plowing the land.

The first object of land drainage is to drain, but this is only a part of what drainage does. To get the whole story we have to compare an acre of tile-drained land with an acre of undrained land throughout a whole season. Consider first the undrained acre in the early spring. The air is already warm enough to promote good growing, but the soil is still filled with frost or very cold moisture. As the top layer dries out the farmer hastens to work it and sow it, so as to get as long a season as possihle. In due time the crops sprout up and send down roots, but the roots cannot go far without being stopped by the cold, water-filled earth beneath. So the roots continue to feed the growing plant from the thin layer of warm soil on top. This is all very well in early summer, but a sthe summer grows hot and dry these shallow roots are no longer equal to the occasion. They have sucked all the moisture and all the nourishment out of the thin top layer. Meanwhile the water level in the soil has dropped lower and lower. Below these shallow roots is a fine rich layer of soil not too moist, but it is too late for them to reach it. Under the August sun the plant stops growing and either shrivels up or ripens at about one-third its maximum size.

Why Drained Land Warms Up Early

Next consider the acre properly underlaid with lines of pipe about four feet deep and a hundred feet apart. No water has lain on this land, nor in the spaces between the grains of the soil. It has been drained empty. The chill of winter has entered it deeply, frozen it and heaved it, and broken it till the soil is no longer caked hard, but is "light" and friable. When the spring comes the warm rains flow easily down through it, and as the water runs out below through the tile drains the war mair of spring follows it. This is the reason why the drained land is always warmer than undrained land in the planting season and why a farmer can sow it earlier. His crops sprout earlier ad send down roo's. The roots grow deep. There is moisture to attract them, but not standing water to drown them. No matter how deep hey go, here is always air for them to breathe. Accordingly, roots are always much deeper and more vigorous on land drained with the little clay tile. Finally comes August with its heat and drought, but here it finds vigorous plants with deep roots. The soil near the surface is dry as a bone, but far below is a great supply of moisture for the roots. So, despite the heat, the crops continue to grow and ripen until the chill of autumn put an end to the season.

Even a hasty comparison like this of land with and land without drain tile shows thta land drainage does not one thing for the land, but at least twelve:

1. Drains staning water from surface.
2. Lowers the water level under ground.
3. Breaks up the soil by air and frost in winter.
4. Allows warm air and water to enter it in spring.
5. Allows seed to be planted earlier.
6. Prevents frost heaving after crops are planted.
7. Allows roots to grow deeper in summer.
8. Gives roots more soil to feed on.
9. Keeps more water stored between soil particles during drought.
10. Produces larger and better crops.
11. Destroys malaria and the mosquito.
12. Improves the health of animals and people on the farm.

But the land drainage, like everything else, must be well done to accomplish its results. One cannot go to he first cross roads and bu the first soft porus article offered and expect permanent results. Many chemicals exist in bogs and drainage waters that can and have destroyed drain tile. Drain tile should be made of the best and hardest kind of clay. It should be like a stone jug, not like a flower pot. Such tile cannot be destroyed by drainage waters charged with carbonic acid. It should be tested for strength to see that it will carry its load of earth.

WINTERING BEES OUTSIDE GIVES BEST RESULTS

Experiments in wintering bees outside, placing four colonies together in a case, were started at the Central Experimental Farm, Ottawa, in the winter of 1912-13, and have been continued every year since. Compared with bees wintered in the cellar, the outdoor-wintered bees have on the average, come out in spring in better condition, judged by the proportion of colonies found to be living in the spring and the number of combs in each hive found to be covered by bees at the first examination, made towards the end of April.

The wintering cases employed were large enough to take four 10-frame Langstroth hives with a space for three inches of planer shavings at the sides between the hives and the walls of the case, and also three inches underneath the hives, and ten or twelve inches on top. The top packing was placed in bran sacks for easy removal.

The outside entrances to the hives, cut in the case as far apart as practicable, measured about 8 inches long by 1⅛ inches high. A piece of wood revolving on a screw reduced each entrance to ⅜ of an inch wide by 1½ inches high during the cold weather.

Sheltering the apiary during winter rom wind was ound to be very important. At Ottawa the wintering apiary is thus proected by a close board fence 6 feet high—8 feet high would be better for an apiary of fifty or one hundred colonies—and Norway spruce trees have been planted close to the fence to take its place in years to come.

An important advantage of outside wintering over cellar wintering was found in the protection afforded by the wintering case and packing during th spring. The colonies thus protected always built pu much faster in the spring than those that were brought out of the cellar and given little or no protection. The hives were left in the wintering cases until June, the casese being deep enough to take one super.

There was a somewhat greater consumption of stores during the winter in the colonies left outside than in those wintered in the cellar, and breeding commenced earlier in the outside wintered colonies. Young bees were usually emerging at the date (average, April 11th,) that the cellared wintered colonies were brought out these latter colonies having eggs only at that time.

The bees got their firs good cleansing flight about the middle of March, three or four weeks earlier than the date the cellar wintered bees were brought out. From the date of this flight onwards they did exceedingly well.

The arangement o ffour colonies together in each case is a particularly good one, because they keep one another warm. They are placed back to back with the entrances on the two opposite sides.

Don't be afraid of the food service pledge. It means Conservation—not Starvation.

BEE ENEMIES

King birds and bee martins and a few other insectivorous birds prey upon bees for the honey that is in their tiny sacks, mainly but are not of much damage unless in yards where queen rearing is carried on. In that case, they prove an expensive luxury, for they will catch the young queens when they go out to mate, in such numbers as to prevent its profitable continuance. They probably take the largest bees that they see, and kill many drones. Their crops have been found full of parts of them partly digested. A shotgun is the proper remedy in the hands of a skilled marksman.

Mice

Mice do not eat bees, but will destroy combs with honey in them and sometimes winter in a hive and keep the bees in such a turmoil that they die in consequence. A good cat, a trap or a storage place for surplus combs, where they can be excluded, is the best remedy.

In wintering out-of-doors or in, they may be excluded from a hive by tacking on wire netting with meshes coarse enough to allow the bees to go through it, but small enough to exclude mice. This will do, but I do not like to confine bees with wire netting in this way if it can be avoided, as they are inclined to fret themselves to death or reduce their numbers greatly, and often it becomes closed with dead bees and the colony suffocates.

Skunks

Skunks often call the bees out on the alighting boards after dark by scratching on it, and then gobble up every bees that comes out. They seem to know how to get hold of a bee without being stung, and swallow the sweet morsel in its honey sack. You may discover it by the scratches in the earth in front of the hives, and a trap is the remedy.

Ants

Ants seem to seek the bee hives for the warmth over the cluster, more than for any other purpose. A strong colony will usually drive them out, but a weak one may swarm out, discouraged by their irritation. Destroy their nests by sprnikling with gasoline or kerosene in early spring, before they get powerful enough to do much damake. Holes may be made in their nests with a crowbar, and a tablespoon of bisulphide of carbon turned in. Stop the hole with a plug of earth. In a day or so they will be found dead, but be very careful of the solution, as it is very inflammable, and its fumes should not be allowed in a room where there is a lamp or fire. Ants are much more troublesome in the south, where they have larger varieties, and whole apiaries are often almost ruined by them.

Spiders

Spiders seem to have a rare appreciation of a heavily laden bee. It is said that spiders may be a valuable help to the apiarist in fightinig the wax moth worm in stored combs, and that there never need be fear of damage from them if spiders have free access to them, for they will destroy them.

Wasps and Hornets

These sometimes capture and carry off bees, but unless they are seen to do this in large numbers, we would

not regard them as serious enemies.

Mosquito Hawks

Called devil's darning needles, are very destructive of bees in the southern states, but do no serious damage here.

The Wax Moth

Is probably the cause of more real damage than all the other enemies combined, and they do no damage to a strong, healthy colony. It is only when they become weakened by disease or some other cause, that they are enabled to get a foothold in a colony. If they do, they very speedily destroy it by tunneling their webs through and through the combs until they become a filthy mass. In the old box hive days and the early days of the movable frame, they were destructive, and moth traps and moth-proof hive patents were numerous, many were driven out of business by their depredations.

In these days, the modern beekeeper regards the bee moth more of a joke than a pest. In fact, it is considered almost a disgrace to allow them to get a start among colonies or combs. I do not remember of ever having any serious trouble with them. Italian blood in an apiary is a sure preventive in the colony, and sheets of tarred paper placed between hives of combs stored will prevent their entrance. Winter's cold in combs stops their ravages, also.

There are two species of wax moth, the larger one (Galleria mellonella) and the lesser wax moth (Achroia grisella). The former is much more general, and, because of that, more destructive. In the south, where cold weather does not check them, they are both much more destructive than here in the cold north. Combs like the Hoffmann self-spacing, if stored, are less subject to damage than the unspaced kind, on account of being placed further apart. Combs, if taken from a colony of Italian bees and kept in a tight compartment, are usually free from pests. However, stocks of hives containing moth-infested combs can be fumigated with sulphur or carbon bisulphide and freed from them entirely.

The Worst Enemy

By all odds is the careless and ignorant beekeeper, who leaves hives and combs where bees have died or hav become infested with diseases lying about, open to the bees of his neighbor to infect his bees and perhaps those of the whole vicinity or countryside. This, in fact, is the way disease and insect enemies are allowed to propagate. To prevent this state of affairs there should be in each state bee inspection laws and competent inspectors to see that such things are not allowed, as the spread of infectious diseases or the propagation of insect enemies. Not until this happens can we be protected in our rights as beekeepers and honey producers to gather the sweets of Maine.

THINGS TO REMEMBER IN STORING SPUDS

Each year there is a considerable waste of the potato crop due to unsatisfactory storage conditions. The losses in storage are in a large measure the result of fungus diseases such, for instance, as dry rot and bacterial rots. In fact, the severe losses from dry rot alone have done much to discourage potato storage in a few potato districts of the west.

It will pay every man who contemplates storing potatoes this winter to apply a few practical considerations to the storage problem. Losses can be greatly minimized by observing precautions such as the following:

1. Nothing but sound tubers should be stored. Discard all that show even the beginning of any form of rotting.

2. Avoid storing bruised or frosted potatoes, as they will soon start rotting and endanger the crop in storage.

3. Diseases can be kept down by maintaining a temperature of about 35 degrees Fahrenheit, which is also best for potato storage.

4. Through ventilation of the pit or cellar. No potatoes should be more than three feet from fresh air.

5. Avoid placing wet potatoes in storage as they stimulate disease development.

TURN WINDFALLS INTO A PROFIT

Windfalls and waste apples can be used profitably by feeding to pigs or dairy cattle. The apples may be harvested in the orchard by swine, or may be gathered and stored in a cool, dry place for fall an early winter use.

Apples, like silage or roots, are fine conditioners and keep the appetite good, thus enabling the animals to handle heavier rations. More value lies in this perhaps, than in the feed value of the apples, although when fed in connection with a protein-rich feed, good returns can be realized. Apples are low in protein content, hence other feed that has a high protein content should be fed in connection.

In different experiments, apples have been found to be equal to 40 per cent of corn silage for feeding dairy cows, and that apple pommance is practically equal to it.

Pigs, when fed apples with shorts and skim milk, used from nine to fifteen pounds less of concentrates for every one hundred pounds of apples fed. At present prices for grain, this gives a value for apples of from twenty to forty-five cents per hundred, which is so much saved.

Get a pig and turn it into the orchard.—R. H. Tucker, State Agricultural College, Fort Collins, Colorado.

Many people misunderstand the food problem. They think they are asked to do with less food. This is not so. They are asked to substitute other foods for wheat and meat.

FEEDING FOR MILK AND ECONOMY IN USE OF SPECIAL FOODS ON SCOTTISH FARMS

An interesting article by Jas. Henry on feeding for milk and economy in use of special foods on Scottish farms, appeared in a recent issue of the Ottawa Valley Journal. We believe the ideas set forth will be of interest to our farmers in the Maritime Provinces and consequently we are taking the liberty of re producing it in the Maritime Farmer.

Economy in the use of foodstuffs always exercises the watchful care of the Scottish farmer. Though liberal feeding to animals of large capacity is undertaken, the Scottish farmer has found out that there is a limit beyond which it may become unprofitable. The point which concerns the feeder is not the amount consumed, but rather the use that is made of it. While experiments to determine the influence of quantity upon digestibility have not been entirely decisive, they clearly indicate that with dairy cows, when the amount of food is fairly within the normal capacity of the animals, it is as well digested as smaller amounts. The experienced feeder in Scotland pins his faith on palatability of food for his cows, and knows that foods which are relished are likely to be consumed in abundance. Palatability is therefore an important factor in feeding; he finds that it stimulates digestion, and therefore economy of returns.

Palatableness usually accompanies a good mechanical condition of the roots, straw, etc., grown on the farm, and on the winter storage of these largely depend the success. This item of the feeding problem always exercises the care of the farmer and is one of the chief reasons of his success with live stock. It is for this very reason that on every farm there is a fixed threshing outfit, driven either by water power, steam or gasoline. An hour or so daily is spent in the winter months in threshing the oat or barley crop, and the fresh straw is relished and readily eaten by cattle that get as many roots as the average cattle stock in Scotland consume. All threshing machines are fitted with a winnowing arrangement that cleanses the straw from all dust and weed seeds. There is very little hay eaten by cattle in Scotland, and straw that has been properly harvested has a high feeding value.

Preparation of Food

Various means of preparing foods have been largely experimented on, and experience tells that cooked foods are no more digestible than the same food uncooked. In fact, some are rendered less digestible through heating. While there are slight individual differences in digestive efficiency among cows, extensive experiments have shown that these are insufficient to account for the widely variable returns made by similar cows from the quantities of the same kind of food.

"Handsome is that handsome does" is especially true of the dairy cow, and the naive Scotsman in his cow testing, safeguards himself at all times by keeping at least an approximate record of foods consumed as well as the product yielded by each individual. Testing for the most part is carried out for the purpose of eliminating the boarder, the high yielder does not figure on his cares, but the well fed low yielder gets short shift when found out. The high average yield in dairy herds and the high average price obtained at Scottish sales is ue to the manner in which the Scottish farmer does his weeding in the cow barn.

Influence of Food on Milk

On the influence of food on milk yield extensive experiments were carried out on a large number of farms, continuously for several years. The work was undertaken and supervised by the Agricultural College, and the results are reliable and are valuable as a guide to the economical uses of expensive concentrated foods for milk production. Fro mthe results obtained the following general conclusions may be drawn:

Although a heavy ration of concentrated food will produce more milk at first than a moderate ration, there is a limit beyond which the ration cannot be increased with profit. An allowance of as much as 12 lbs. per 1,000 lbs. of live weight per day of concentrated food, such as cotton seed meal, gluten grains, etc., was found to be excessive, both from a point of health and also having regard to profit.

When cows begin to fall off in their yield as the lactation period advances, an increase in the concentrated food does not check this falling-off except temporarily; and, conversely, a decrease in the concentrated food under similar conditions does not cause a more rapid falling-off in the yield. The character of the cows has much more to do with determining the quantity and quality of the milk than the actual amount of concentrated food in the daily ration so long as the cows receive enough to keep them in a thriving condition, and it is a mistake to suppose that once this limit is reached an increase in the concentrated food results in a corresponding permanent increase and improvement in the milk. It may indeed have the opposite effect. Finally, as the results obtained in these experiments indicate that a heavier ration of concentrated food may be employed with profit early in the lactation period than can be done as the period advance it seems probable that the most economical method of feeding dairy cows, having regard only to the milk produced, would be to make the ration largely dependent upon the amount of milk the cows yield. In other words, the full ration should be given when the cows are in full milk, and as they fall off in yield the allowance should be gradually curtailed until, at the end of the lactation period, it reaches the minimum necessary to keep the cows in good condition.

Cows on Pasture

The advantage of giving dairy cows which are out on grass during the summer months a supplementary ration of from 4 lbs. to 8 lbs. of concentrated food, is exceedingly small as regards the yield of milk, provided the pasture is of average quality. It is doubtful, having regard to profit, whether any concentrated food should be used at all on grass during the summer if the pasture is of average quality, the season normal, and the cows in a healthy and thriving condition. To increase the concentrated food as the season advances is not to be recommended, as it does not, except temporarily, cause an increase in the milk, or even check the fall in the yield which always takes place as the lactation period advances. As regards the suality of the milk there does not appear to be any advantage whatever on the average in using on grass concentrated food of the kind employed in these experiments. Concentrated foods supplied to cows on grass does not necessarily cause an increase in the live weight of the cows, even when it produces no effect on the milk yield. When cows are fed on fairly good grass in the summer they do not require much additional artificial food, and when such is supplied it is at a loss as far as the milk yield is concerned. Confirmation is also given to the conclusion previously arrived at that no addition to the food could prevent, except temporarily, the falling off in the milk yield as the lactation period advances.

Experiments in Milking

Along with the feeding experiments there were others conducted at the same time with a view of obtaining information upon the following points:

1. The effect of milking at equal and unequal period on the quantity and quality of the milk.
2. The results of milking cows three times a day as compared with milking them twice.

The results of the experiments may be summarized as follows:

1. It cannot be said that the total quantity of milk is inbuenced by the equal or unequal periods of milking, but the quality of the milk is seriously affected, cows which are milked at equal intervals producing more butter fat than when milked at irregular intervals.
2. No increase of the milk yield was obtained by milking three times a day in preference to twice. On the contrary, the extra driving and interference with the cow seemed to produce results of a negative character. The quality of the morning milk was also adversely affected by the additional milking.

Feeding Experiment with Palm Kernel Cake

On account of the great rise in the price of artificial feeding stuffs it was considered desirable that experiments should be undertaken with a view to demonstrating the feeing value of some materials that, on account of the war, were available in considerable quantities, but which had not been hitherto largely used, and with which farmers were generally unacquainted. The experiment was devised for the purpose of determining the feeding value of one of these materials—palm kernel cake—and the agricultural colleges conducted the trials. Palm kernel cake is the residue from

Oh! My! That Smells Good!

And, madam, you should just smell the fragrance of *crushed* coffee after it is brewed. And the flavor of it! Well, you never tasted ground coffee with a flavor just like Red Rose Coffee. Coffee critics, those who have travelled far and wide and tasted coffees in various climes, tell us they have never tasted more delicious coffee. Some have even said—but we will refrain from printing such high praise. We prefer you to try Red Rose *Crushed* Coffee without revealing anything further as to its quality. We don't want to take all the edge off the surprise in store for you when you try it. And the same price it was three years ago.

KIDNEY TROUBLE AND BACKACHE

Dr. Cassell's Tablets Strengthen the Kidneys and Restore their Natural Activity

Kidney trouble means Kidney weakness. Dr. Cassell's Tablets strengthen the kidneys through the kidney nerves, and thus effect cures where ordinary means fail. The average kidney pill or mixture is designed to relieve symptoms which are really due to imperfect kidney action. Dr. Cassell's Tablets, on the other hand, go to the root of the trouble, and by supplying vital power and strength enable the kidneys to act properly. A moment's thought will show which is the right method, and why Dr. Cassell's Tablets cure so thoroughly.

A free sample of Dr. Cassell's Tablets will be sent to you on receipt of 5 cents for mailing and packing. Address Harold F. Ritchie and Co., Ltd., 10, M'Caul-street, Toronto.

Dr. Cassell's Tablets are the supreme remedy for Dyspepsia, Kidney Troubles, Sleeplessness, Anaemia, Nervous ailments, and Nerve paralysis, and for weakness in children. Specially valuable for nursing mothers and during the critical periods of life. Price 50 cents per tube, six tubes for the price of five, from Druggists and Storekeepers throughout Canada. Don't waste your money on imitations; get the genuine Dr. Cassell's Tablets.

Proprietors, Dr. Cassell's Co., Manchester, Eng.

the kernels of nuts of the West African oil palm after compression of the oil, which is a valuable commercial product used in the manufacture of margarine. This trade used to be entirely in the hands of the Germans, but since the war two mills have been erected in Britain with a combined capacity of 70,000 tons per annum.

The cows receiving the palm nut cake did not increase in quantity of milk in any undue proportion compared with those receiving cotton cake or linseed cake, but their general condition improved. There is evidence to show, however, that palm kernel cake gives a higher percentage of butter fatin milk. Until the acute transport conditions arose, palm kernel cake was very much cheaper than cotton or linseed cake, and gave a better monetary return as a feed. It will likely come into its own when normal times come again.

On Scottish farms there is not the same amount of concentrated feeds bought, as there is with the Canadian farmer. In Scotland the quality of stock gives the farmer a good market for his field produce. The beef producer has the quality of animal that fattens on the daily fresh ration from root cellar or straw shed, with a little cake added at finishing months. The dairy cows with their high average of milk yield give good returns for the home farm feed, and profits are not derived from excessive and indiscriminating feeding. Breeding and feeding go hand-in-hand, and the Scottish farmer is clear on this point, that careful and successful breeding is the best economizer of foodstuffs.

CARE OF CREAM CANS

I am not thinking of holes in the vessels when I say that there is a big needless leak in cream cans. The cream can is one of the worst slammed about, rammed about and jammed about pieces of furniture known to our twentieth century civilization. And part of the bad usage is quite unnecessary.

The war is creating a special reason why cream cans should be treated with greater respect. There is a present shortage of tin plate, from which cream cans are made, and in the United States, as well as in Canada, efforts are being made to impress can handlers with the importance of caring for these vessels. One United States publication just to hand says, "It may soon be impossible to secure more milk, cream or ice cream cans until after the war." If a real famine in milk and crea means were to occur, the loss to the farmers would be much greater than usual because of the higher prices which are now obtainable for milk and cream.

Here are Some "Cans".

You can avoid using milk or cream cans for wrong purposes. Sometimes people put gasoline in them and ruin them almost immediately.

You can refrain from battering the cans needlessly.

You can return other people's cans, if you happen to get them by mistake. The owner needs them.

You can see that your can does not lie about the railway station. Even though you may not be going to use it at once, take it away and care for it.

You can remind the railway agent that he may help by giving cans as much protection as possibel.

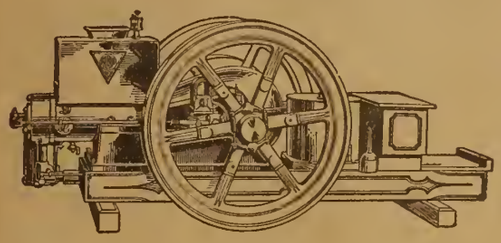
You can rinse the vessel before using. It may have been thoroughly cleaned at the factory; but it needs a fresh rinse before using.

You can keep the vessel clean inside. Use a little sal soda occasionally in washing the tins out, if necessary.

You can see that a tin does not stand in a damp place or with moisture inside. Especially at the end of the season, when the cans are being put away, dry each carefully and store under cover in a dry atmosphere.—By L. A. Gibson, Dairy Commissioner for Manitoba.

"MACHINES MUST TAKE THE PLACE OF MEN"

Let the "Alpha" do your work



Grind Feed
Saw Wood
Pump Water
Run Separator,
Churn or Washing Machine

AN ALPHA Engine is almost indispensable on the farm these days when labor is so hard to get. It's so reliable, too. Always on the job. Never quits. Never gets laid up. You can always depend on "Alpha."

Thousands of Canadian engine-owners swear by the ALPHA because they have found that it is reliable at all times and under all conditions. It is sturdily built. It is simple in construction. It is powerful. It runs on either gasoline or kerosene and develops its full published horse power on a minimum amount of either. If you want an engine that you will be thoroughly satisfied with, put your money into an ALPHA.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

THE DE LAVAL COMPANY, Ltd.

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA.
Sole manufacturers in Canada of the famous De Laval Cream Separators and Ideal Green Feed Silos. Alpha Gas Engines, Alpha Churns and Buttermakers. Catalogues of any of our lines mailed upon request.

MANAGEMENT OF THE BULL

We read and hear much concerning the feeding and care of dairy cows and heifers, yet although the truth of the old saying — "The bull is more than half the herd"—is universally acepted, we hear very little said about the proper feeding and care that should be alloted to this very important part of the dairy business. The reason for this apparent apathy is doubtless because there is a greater fund of evidence and knowledge pertaining to the females. There has been a great stimulus to the collection of data pertaining to cows, for it is from the dam that the direct iincome s realized.

Many catlemen have come to the realization that a bull with superior ancestry is absolutely essential to the building up of a profitable herd, and do not hesitate at the item of cost when making the purchase. When considering the raising of a young animal to head the herd, the item of cost shuld not be considered with same idea of eceonomy as in the rearing of heifers. From the birth of the young bull, it should be the practise of the owner to see that he gets the best of care and feed, in order that he may make the maximum growth and dvelopment. There is no definite data to prove that an unthrifty condition of the sire, as regards to growth and size, caused by improjer feeding and care will have a deleterious effect upon his offspring, yet everyoneis aware that the visitor or prospective purchaser passing through the barn wonders whether this condition of undersize is the resultof poor feeding or poor breeding.

The price now offered for skim milk is quite attractive, compared to what it was a couple o fyears ago; however, in the opinion of the writer, the investmen of skim milk in a young bull will be amply returned with interest in later years. Bulls are seldom weaned later than six months of age; if possible, continue feeding the skim milk, even if only in small quantities, until they are eight, ten or even 12 months old. The aim should be to produce a growthy, thrifty animal. This end can be secured with more certainty through the feeding of milk with grain and good roughage than by the pursuit of any other course.

The young bull should be separated from the other calves at six months, a small ring placed in his nose, and taught to lead. This ring will last about one year, when another should replace it. At the end of the next year another heavy ring should be put in. A weak ring in the nose of a strong bull often spells disaster.

After the bull is 12 months old, he may be used for light service, but should not be used liberally until after two years of age. It is quite generally conceeded that using young bulls to excess causes early impotence. To some, this may not appear to be an important point, for many cattlemen do not keep their bulls after they have attained an age of two or three years. This practise should be discouraged, for a bull will have but few, if any, daughters in milk at this age, and his value will still remain unknown.

It is abslutely essential to the well being of the bull that he receive exercise. This may provided by housing him in a cheap shed, adjoining an exercising yard or paddock to which he has free acoess, or he may be turned out at certain times each day. Some dairymen use a treadmill for exercising their bulls, others tie him to a tight wire suspended overhead in such a manner as to allow more or less liberty, but yet always in their control. We have used both methods with indifferent success. For our conditions, we have have found that the most successful method of exercising our bulls is working them under a yoke. We have trained without diffiiculty eight bulls of different breeding to work under the yoke, and have been well satisfied with this system as a means of securing the necessary exrcising that the sire must have to remain potent. Lambert S. Corbett, Professor of Animal Industry, University of Maine.

CHOOSING MEALS FOR FEEDING HERD DURING THE WINTER

The most successful cattle feeders purchase and feed profitably a reasonable supply of mill feeds and concentrates. What feeds to select and when to purchase are at present most difficult problems.

The man who buys meals in small amounts as needed and buys the meal cheapest per hundredweight is a poor business man and does not appreciate the real values of feeds.

The feeder who has rich and succulent farm-grown roughages need purchase and feed less grains and meals and the meals purchased need be of a less concentrated nature. The intelligent cattle feeder always raises on his farm the best possible quality of feeds and makes his purchases of grain and meals to balance the rations properly.

There are but two correct methods of choosing meals when purchasing. Which method to follow depends altogether on the quantity, quality and variety of the farm-grown roughages. Purchases should be made on the basis of the protein contained in a digestible form or the total digestible nutrients. (protein plus starches plus fat x 2 -14.)

For example, red clover hay contains 152 pounds digestible protein and 1,018 pounds total digestible nutrients per ton, timothy hay has only 60 pounds digestible protein and 970 pounds total digestible nutrients per ton, corn ensilage has 22 pounds digestible protein and 354 pounds total digestible nutrients per ton, and mangels or swedes about half as much of each. Clover, or better, alfalfa, hay supplies the protein of a ration in about the correct proportion, while timothy hay must be supplemented with a rich protein meal. Again, corn ensilage, although bulky, supplies the cheapest total nutrients of any feed, but requires a protein meal to balance it. Ensilage made from green clover, oats, or oats, peas and vetches, is worth almost as much as good corn ensilage.

The same relationship exists between all the meals which are purchased for the feeding of stock. The farmer who has grass hay (such as timothy) and corn ensilage, must buy meals on the basis of cheapness of protein. At present prices these in order of cheapness are: Cottonseed meal, dried distillers' grain, linseed oil meal, gluten feed, wheat bran, shorts, middlings, and oats. If, on the other hand, he has alfalfa or clover hay, corn or other good silage and roots he need purchase less meal and should select on the basis of cheapness of total digestible nutrients. At present prices these in order are: Dried distillers' grains, beet pulp, wheat middlings and bran, gluten feed, cottonseed meal, linseed oil meal, and oats.

Every farmer can in a few minutes with present feed prices and the analysis of digestible nutrients, verify the above and select his purchases accordingly.

Certainly if he wishes to get the most value for his money he must follow these four rules:—

.1 Buy the highest quality feeds, not those containing dirt, filler and indigestible fibre.

2. Buy feeds containing the desirable elements in the cheapest form.

3. Buy co-operatively, in car-load lots if possible and thus save extra freight charges and commissions.

4. Buy when markets are lowest, usually in the summer and fall, and save the storage, handling charges, and, usually, extra profits made by the millers and dealers.

PURE WELL WATER ON THE FARM ABSOLUTELY ESSENTIAL TO HEALTH OF FAMILY AND ALL LIVE STOCK

One of the greatest menaces to the health of many communities is the impurities of the water supply. Decayed food is readily condemned because the dangerous parts can easily be seen, but the drinking water used by man and beast, although often more dangerous to life and health, is allowed to pass without a question because the elements of destruction are not visible to the naked eye. These, however, are often the more dangerous of the tow and every attention possible to secure a pure water supply on the farm should be given in order to safeguard the interests of the family in the matter of health preservation.

Good health is the most important asset of any man's business or physical outfit, and while on the farm in almost every case it is possible to secure a practically pure supply, there are thousands of farms where the water is not fit to drink either by man or beast.

Pure water is even more necessary to health than pure food, and the wise man who wishes to purchase a farm will look a long way for one before he will decide to locate on a place where this important feature is not guaranteed.

The outlay that is necessary to secure adequate protection against this form of menace to good health is not necessarily very great, and no man, on account of the few dollars it will cost, can afford to jeopardize his own health or that of his family. In many cases all that is needed is a little care, while in others the cost will be considerable, but in any case it will be much cheaper than drinking impure water.

There are three common causes of water contamination—first, from seepage, such as water soaking through the soil in filthy quarters; second, by water flowing over the surface of the ground and falling into wells, and third by foreign substances getting into wells for want of proper protection, such as toads, mice, worms, etc., and the droppings of poultry or other animals running in the vicinity of these unguarded water supplies.

Underground water is the chief source of supply on the farm, and in the majority of cases this comes from dug wells which are located dangerously near barnyards or other places from which water can find its way into the well by seepage. It is estimated by some that water filtering through ten feet of soil will become purified on its way, but this will depend on the character of the soil. If it be of a coarse, gravelly nature, little change will be made in the character of the water, hence to be sure of freedom from contamination from this source the well should be located far enough away from such a place to avoid any danger from water passing through a strata of this nature into the well. Even though a well is not situated near a barnyard or other source of infection, it may become infected by water passing over the surface of the ground. All land contains more or less impurities at the surface, hence all surface water is contaminated to a greater or less degree and should never be allowed to enter into a well, directly at least.

In order to avoid any possibility of surface water getting in a well the first requisite is to have the well located on land well above the level of the surrounding premises. If the land is comparatively level and no opportunity of selecting an elevated position is possible, then the ground should be raised in the vicinity of the well by grading or drawing clean earth from some other place for this purpose.

In loating a new well, all the features necessary to secure pure water should be kept in mind as well as the thought of convenience, which should be sacrificed largely, if necessary, to secure pure water. However, this is not as serious a proposition as some consider, for water can be conveyed by iron piping at reaonable expense to a considerable distance, and instead of having two or three wells for the farm, one good one should be put in a safe place and made to do service for both dwelling an barns. DE LAVAL

With butter prices soaring no cream producer can afford to go another month without a New De Laval Cream Separator.

This is true whether you have no separator, or an inferior or half-worn-out machine, or even an old style De Laval.

In cold weather your waste of butter-fat is relatively greater, either with gravity skimming or a poor separator; and at present prices for cream a De Laval would very soon pay for itself out of its own savings.

See the nearest De Laval agent right away and let him show you what the De Laval will save for you. If you do not know the local De Laval agent, write direct for any desired information.

The De Laval Company, Ltd.

MONTREAL PETERBORO
WINNIPEG VANCOUVER

count of the danger from seepage a well should not be placed less than one hundred feet from possible sources of infection, such as barnyards, manure pits, privies, etc.

There are three kinds of wells in general use throughout the country—dry wells, driven wells and drilled wells.

Of these the dry well is more liable to contamination than either of the others on account of the difficulty of making the first ten feet or so impervious to surface water and insects. This con only be done by the use of such materials as cement in laying up the curbing and carrying the same to a sufficient height to prevent any surface water running into it, which at the same time will prevent any insects from gaining entrance except at the top. This part of the well should be carefully covered with close fitting joints so that no cracks or open places will be present where worms or dirt can get into it. A good arrangement is to cover with a layer of strong boards, over which to lay a sheet of galvanized iron, this again to be followed with another layer of wood, all of which should be securely fastened to oak or other good sills imbedded in the cement. By this arrangement no surface water can gain admittance to a well and all liquid must partake of the nature of filtered water and be pure and wholesome.

Driven and drilled wells put own through an impervious layer into an open one is likely to meet with pure water and will continue so if properly protected at the top. On account of the narrow opening in these wells they are easily protected. A close fitting plank cut through the centre and fitted around the pump is all that is necessary if proper drainage is provided for, which should be the case whether the pipe comes above the surface of is cut off a few feet below to provide against frost.

If for any reason you are suspicious of well water either at home or school, notify Professor D. H. Jones, Basteriological Department, O. A. College, Guelph, or Professor Frank T. Shutt, Dominion Experimental Farm, Ottawa, who will send you a sterile bottle with directions for obtaining samples. Upon receipt of the sample, Professor Jones or Professor Shutt will make a test free of charge and will promptly forward you an analysis.

Meanwhile guard the health of your family by disinfecting the water used. Dissolve a level teaspoonful of chloride of lime in a teacup of water. Dilute this quantity with three cupfuls of water and add a teaspoonful of the diluted solution to each two gallons used of drinking water. Stir thoroughly. The water will be without taste or odor and will be safe for human consumption.

Failing this efficient and inexpensive method, boil all water used for at least twenty minutes.

Where an old well has become poiluted and it is in a good location, and one wishes to continue its use, it may be made safe by tearing out the old lining to a depth of ten feet and relaying it with cement backed by a foot of puddled clay of very close texture and then following the above directions as regards the elevation of ground to prevent contamination from the opening by surface water or dirt. The water in the well should be pumped and the well washed down thoroughly and cleared out.

SALT AND BRAN SHOULD FORM PART OF ANIMAL'S RATION

A local veterinary said in my hearing a few days ago that salt and wheat bran were two of the surest safeguards against fatalities with live stock that he knew anything about. "If more wheat bran were fed and if salt were kept before stock at all times there would be a great saving in veterinary bills," he said. "The majority of cases that have demanded my attention for the past several months are cases of indigestion or disarrangement of the digestive organs in some manner. Many feeders try to correct this without removing the cause. One o fthe most frequent causes of these disarrangements is the lack of salt in the regular diet. Stock fail to drink enough water and there is nothing in their ration to act as even a mild cathartic, consequently the digestive organs become cloggsd.

In speaking further in regard to the need of salt in the daily ration the doctor added that it was poor policy, as a rule, to mix it with feed. He advocated the use of salt in open boxes where livestock could have access to it at any time and his opinion is borne out by most breeders and feeders who have made a success of their calling. Many of them use rock salt but a box sheltered from the elements and kept filled with ordinary barrel salt answers the purpose quite as well. In the course of our talk I asked him if there might not be donger of stock eating too much salt when they had this easy access to it. He said there was no danger.

"I tried it first," he explained, "with a stallion which I owned. I placed a box of salt in his stall and for several weeks that box was the first thing he visited when being turned into his stall. He would invariably go to the salt box before going to his corn. Now he only visits the box occasionally. His system des not demand the salt that it formally did for the simple reason that the need for it is being regularly supplied. For the past six years this salt box has never been empty and the horse has never shown the slightest indication to digestive trouble although formerly he was so afflicted."

The use of both salt and wheat bran as a regular part of the ration for livestock is shown to be vluable when the feeding rations of successful breeders are examined. Bran has a place in almost every ration from the laying pen of poultry to the barn where the dairy cow is being tested. In itself it is an excellent bowel regulator aside from its feeding value and the more one uses it in the ration the more indispensable it seems. If wheat bran and common barrel salt will aid in keeping the disorders away from our live stock it is a good plan to make use of them and no one who has ever supplied salt regularly to herd or flock and then suddenly failed to supply it has failed to note the ifference which it makes. It takes but little time to build suitable boxes that will hold salt and to shelter them from the wind and rain and once the yare made it is a small matter to keep them replenished. The old fashioned method of throwing a handful of salt on the ground once or twice each week is both wasteful an inefficient and it seems to me that the open box plan is worthy of a trial even by the skeptical.—W. C. SMITH.

ROCK SALT

THE HORSE

TENDONS AND LIGAMENTS

A tendon is a mass of fibres which connect a muscle to a bone. A ligament, on the other hand, is a structure of fibre resembling quite closely those that make up the tendons but differ in this respect from them, viz.: Ligaments connect one bone with another. An example of the ligaments of a horse are the suspensories of both front and hind legs, besides which there is shown in his hock both tendon and ligament. Just above the hock there is a strong mass of fibre which stands out clearly, which you can grasp with your fingers and is called the hamstring, or more correctly speaking the "tendon of Achilles." Now just below the hock and connecting the bone that holds the hamstring above, there is another structure, a ligament which connects this part of the hock with the bone below. This is known as the Calcaneo Cuboid ligament, the straining of which constitutes the common unsoundness in horses to which has been given the name of curb.

Every joint in a horse's leg is formed by ligaments holding the bones in position. The tendons are allowed considerable play, as the muscles to which they are attached lengthen or contact as the horse moves his limbs. On the other hand, the position of the ligaments are supposed never to change, their duty being to hold the bones together in proper relation to one another.

Balance of the Foot

Damaged tendons and injured ligaments are the bugbear of the owner and trainer of race horses and the frequency with which accidents to these parts are met with go to show that they are due to the fact that the foot of the horse on is ground surface is in improper relation to the ligaments and tendons above. Horses that are barefooted and accustomed to running out to grass neevr suffer from damaged ligaments, though now and again a curb may be formed. A horse troubled with inflamed suspensory ligaments will invariably be found to have his heels too low, thus causing an extra strain on these ligaments. When the tendon above the ankle gets into trouble, curiously enough the cause is directly the opposite from that which produces damage to the suspensory ligament. In these cases the horses's foot is too short and his heel usually too high.

In preventing damage to tendons and ligaments, it is necessary to so balance the foot that while a correct angle must be obtained neither tendon nor ligament should suffer as a result of extreme efforts.

To establish the desired position of the foot it is essential to so prepare the foot that, when it is shod, the shoe will be worn level from toe to heel and so that both sides may wear equally. Indeed nearly all that is accomplished in the way of improving a horse's gait and speed and preventing him from hitting his knees and other parts is accomplished in the way of improving ? st- shrdlu etaoin same manner.

Cocking of horse's ankles, whether at front or back, or both—is a coddition brought about by the heels being too low; the joints above, in trying to compensate for the added tension forced on the tendons, yield an cause the cocking of ankles. There is another conition known as bucked knees, or knee-sprung, that arises from the same cause—heels too low.

Knee-Spring Compensation

Horses whose joints will accomodate themselves to a faulty position of the knee, and which become cocked in the ankle, or knee-sprung, thereby save their tendons and ligaments from break down. It is that other class whose joints refuse to compensate, that are more likely to break down as a result of the faulty position of the foot in its relation of the arrangements of the ligaments. When a tendon shows damage, lower the heel and lengthen the toe a little. When there is incipient damage in the suspensory ligament the rule is to raise the heel and shorten the foot slightly.

As rgards the proper length of a horse's foot, it may be added that excesisve length and extreme shortness of the front foot of a horse are dangerous in the extreme. The long foot almost always carries with it a low heel, and such a foot will result very often in damaged ligaments. On the other hand an extremely short foot causes increased friction in the horse's gait and not only tires him, but is very liable to damage the tendons; this is especially the case where the foot is shortened a great deal at one time.

If we begin with a colt and level his feet as nature intended them to be, in relation to his legs, the tendons and ligaments will be in such position at all times, excepting in cases of accidents, that they are prepared to take care of the strain that is put upon them, and, as a result, they will keep sound.

If, on the other hand, we find that the colt has had his feet dressed in an unnatural manner, so that extra strain is put on the ligaments or tenons, then we must go about the matter of correcting the fault.—B. C. T.

EFFECT OF GOOD ROADS ON PULLING POWER OF HORSES

A very interesting experiment has recently been concluded in California to determine just how much a horse pulls when he draws a ton.

A good draught team was used for this purpose. The horses weighed 1600 pounds each. They were hitched to an ordinary farm wagon, and puled a load of 6.000 pouns over different kinds of roads. The wagon was a standard farm wagon with steel axles of equal length, wheels 38 and 46 inches in diameter, and four-inch tires.

A recording dynamometer, known as the Iowa type, was used to register the tractive force of the team. This instrument makes a record of the resistance on a strip of paper under a recording pencil, and after the test, the total pull of the team can be read off in pounds. The cord of the test is as follows:

On a concrete road, unsurfaced, in excellent condition, the total pull on the load was 83 pounds, or 27.6 pounds per ton.

On a concrete road with ⅜ inch surface of asphaltic oil and screenings, road in excellent condition, the total pull was 147.6 pounds or 49.2 pounds per ton.

On the ordinary macadam road in excellent condition, the total pull was 193 pounds or 64.3 pounds per ton.

For a gravelled road, compact, and in good condition, the total pull was 225 pounds or 75 pounds per ton.

An earth road, firm, with 1½ inches of fine, loose dust, the total pull was 276 pounds or 92 pounds per ton.

An earth road, with mud 4 to 6 inches deep, but soil firm underneath, the total pull was 654 pounds or 218 pounds per ton.

On graveled road, before the gravel had been compacted, but when it was in ordinary loose condition after it had been placed upon the road, the total pull was 789 pounds or 263 pounds per ton.

The above shows very well what great advantages good roads have as far as the hauling properties of a team are concerned.—E. B. House, Colorado Agricultural College.

KNEE SPRUNG HORSE

Editor:

Horse five years old is weak on his knees. Can anything be done to strengthen them?

Renfrew Co. C. O.

Weak knees among horses are generally contracted amongst those who are driven at hard and fast work. It also appears on horses that stand on floors that have a big slant, high in front and low behind, or from feeding out of a very high rack. Horses with small knees are more subject to knee weakness than those with strong knees. An animal may be knee sprung and still be a good work horse. See that the floor of his stall is level, and do not put on shoes with high heels. If you are working the horse, bathe the legs with cold water and salt twice a day; after bathing rub dry and apply white liniment made as follows: Liquor ammonia, 1 ounce; tincture of arnica, 1 ounce; tincture of opium, 1 ounce; oil of turpentine, 1 ounce; alcohol, 1 ounce, and water to make one pint. If you do not want to work the horse perhaps you could blister the back cords once a month with pulverized cantharides 2 drachms, and 1 ounce of lard or vaseline mixed together. Tie his head short for a few hours so that he cannot bit it, then in three days, grease it with good clean lard. Repeat in a month. In the blister treatment do not work him.

HORSE TALK FOR OUR HORSEMEN

I have a nervous horse. The only satisfaction I can get is to drive him regularly and work him hard enough to take off the nervous edge. In handling such an animal I wouldn't put him where he could do much damage. Throw away the check and blinds, for a nervous horse is more excitable when he cannot see what is going on behind him, and a check worries a horse a good deal.—H. P.

We, too, have had trouble with a nervous mare that would not stand to be hitched up, and insisted on starting before we were ready. We insisted firmly but gently, that she stand until we were ready to go, and when she balked we paid no attention to her, not urging her nor speaking to her. Later we stopped her when she was ready to go, and made her wait for a signal, and she soon got over the habit.

Gain the confidence of your horses by talking to them. Kindness and patience will accomplish almost anything with a nervous horse.—L.

PROTECT THE HORSE'S HEELS

Here is a clever idea put to use by a man whose ingenuity has helped him to own a good farm. Harvest at his place is a busy time and he has learned that every little thing to conserve man strength and patience is worth while in keeping men and getting good service from them. He has a pair of wheels from an old grain binder truck with a short axle and

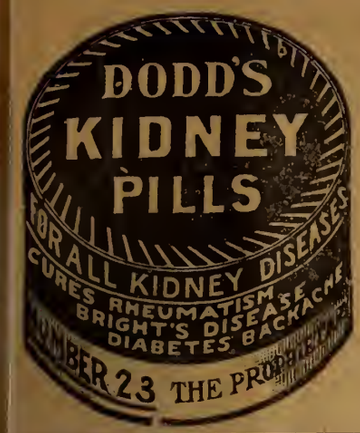
U. S. Factory, New Brunswick



ongue and a heavy hook at the back of the axle, bolted securely through. In hoisting hay he hitches the team to this two-wheeled truck, hooks the hay rope into the hook at back of axle and tis does away with bumping the horses' heels with doubletree and saves a man from hanging onto the rope while the horses are turning and coming back after the load is up. In dragging logs, brush or anything with a chain, this truck comes in handy on fairly smooth ground.

Have you a pair of binder truck or old mowing machine wheels to try it with?

WATERING THE HORSE

When shall the working horse be watered, before, after or during meals? This is a question that has been variously discussed by authorities on the horse. According to Tangl, whose investigations concerning the time of watering horses are the most complete recorded, it doesn't make any difference, though circumstances may favor the one or the other. He shows that the important thing is to adopt a reasonable, convenient system of watering horses and then to stick to it. It is dangerous, of course, to allow a horse to gorge himself with cold water when he is heated from hard work, but a moderate drink from the stock tank will refresh him without any harmful effects. The exercise of good "horse sense" is more important than the matter of just when at meal time the water should be allowed.

WOLF TEETH

The "wolf teeth," so much spoken of by horsemen, are little, plain, short-rooted teeth sometimes found one on each side, just in front of the first grinding tooth (premolar) of the upper jaw. The wolf tooth is merely a vestige of the seventh grinder, or anterior premolar of the prehistoric horse. They have no influence whatever upon the eyes, common erroneous belief to the contrary, and, therefore, are not the cause of "moon blindness" (periodic ophthalmia), and need not be removed. Often they are "shed" by the time a horse is eight or 10 years old. Leave them alone.

THRUSH

The cause of thrush in horses' hoofs is uncleanliness, standing in filthy stables, especially in their own excrement. The filth remaining in the foot a long time and excluding the air, sets up decay which runs into ulceration. When once started it is hard to cure. You say reasonably bedded, but all depends upon the view which one takes in horse comfort. A cow that has to sleep or rest on a half bedded hard cement floor will not produce the same quantity of milk as she would if comfortably and cleanly bedded. A horse is the same. He cannot give the same service if he has to stand or sleep on a hard bed and amongst his own filth.

Trim off all the ragged parts of the frog, clean out all the holes and cracks with a case knife or similar implement, then apply a linseed poultice, with charcoal powdered over the surface. After twenty-four hours clean it all off, and dress the affected parts with calomel well introduced into all the cracks. Repeat this once or twice and when dry dress the part with pine tar.

FALL FEED FOR FOALS

When the pastures dry up in the fall the foal sometimes gets a setback. The time after the grass becomes a little scarce and before fall feeding begins, is an important period in his development, for a foal or any other young animal never makes up the growth lost at any time during its growing period. They should be kept in good, thrifty, well-fed condition at all times until maturity is attained, if the best is to be made of them.

Colts that belong to working mares should have a separate feed box and receive a little grain each time the mother is fed. Those on pasture should be provided with a creep where grain can be kept available for the foal at all times. If these methods are followed, the colt will continue to gain and will not shrink when weaning time comes. Equal parts of crushed oats and bran make a good ration for the young foal.

LICE COMMON PESTS

Lice are the most common parasites on farms. Equal parts of lard and kerosene rubbed into the hair of horses and cattle, or into the feathers of chickens, will destroy lice, according to the University of Missouri College of Agriculture. Any of the coal tar preparations are effective when used at the rate of three ounces or six tablespoonfuls to a gallon of water. This can be sprayed on hogs. Cattle or horses with heavy coats must have it rubbed in thoroughly.

ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

will reduce inflamed, swollen Joints, Sprains, Bruises, Soft Bunches; Heals Boils, Poll Evil, Quittor, Fistula, or any unhealthy sore quickly as it is a positive antiseptic and germicide. Pleasant to use; does not blister under bandage or remove the hair, and you can work the horse. $2.00 per bottle, delivered. Book 7 K free.

ABSORBINE, JR., antiseptic liniment for mankind. Reduces Painful, Swollen Veins, Goitre, Wens, Strains, Bruises, stops pain and inflammation. Price $1.00 per bottle at dealers or delivered. Will tell you more if you write. Manufactured only by

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.50 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

THE LAWRENCE WILLIAMS CO., Cleveland, Ohio

LAMPAS IN HORSES

Lampas or "lampers," the name given to a swelling of the hard palate causing it to project below the level of the upper incisor teeth is not a disease, need not cause alarm, should not be cut or burned, and readily is remedied by attention to the teeth, giving treatment for indigestion or worms, allowing a colt to eat old hard ear corn, and rubbing the swelling twice daily with a block of alum.

A TIMELY WARNING

If you home should catch lre today or to-night, have you a ladder handy to get on the roof? Or would you be compelled to borrow one from your neighbor or run to the back end of the orchard for your own? It is pointed out by first inspectors that many of the fires in the country start from sparks on the roof; a bucket of water when the blaze first appears is worth a barrel after the fire has a few minutes headway. A strong ladder makes it possible to reach vres with little trouble.

"VIVAT"

is an energetic remedy in powdered form, prescribed with great success by prominent veterinary surgeons, for the absolute cure of coughs, heaves, etc. It acts as a diuretic in cases of colics and is prescribed for worms.

"VIVAT" strengthens draught-horses as well as racers and gives them endurance.

A 50c box of VIVAT is sufficient for 6 days' treatment.

FOR SALE BY ALL PROGRESSIVE MERCHANTS.

POULTRY.

FATTENING THE POULTRY FOR MARKET WHEN FLOCK IS CULLED IN THE FALL

Fall is the time of the year for culling the flock, the time of the year when all of the birds that are not to be kept for winter layers should be sold off. All of the cockerels that are not to be kept for breeding purposes as well as all of the hens and pullets that are not to be kept for layers should be culled from the bock and fattened for market.

A plump cockerel or hen is just as superior to a scrawny fowl as is a corn fattened steer to a raw range animal. The consumer as well as the poultryman recognizes this fact and there is always a ready market which will pay as high as six to eight cents a pound more for fattened birds than they will for the same stock before it has been fed out.

Birds which are to be fattened should not be allowed to run. They should be confined in small pens or coops in order that they may not exercise too much and thus run off the fat as fast as it is put on. Commercial poultry feeders use immense batteries of specially constructed coops for fattening but for the average home fattening plant a single coop or a smaller battery can be cheaply constructed.

These should be made about 35 inches in length by 24 inches deep and 16 inches high. They may be made as are any other slat coops but with half inch mesh hardware cloth as a floor instead of the common flooring; this will allow the droppings to pass through and will greatly facilitate cleaning.

A crate of this size will hold about six to eight birds and as many coops as will be needed should be provided. If more than one crop is to be used they may be arranged in blocks of eight coops very conveniently. In this manner the coops are placed one on top of the other, four coops high, and back to back. This also does away with the cost of a top for each coop.

A further convenience in keeping the coops clean is a sheet iron tray placed under each floor to catch the droppings. These trays are so fitted into the coop that they may be slipped out, emptied, an dput back in place with very little inconvenience.

Some sort of a tight and removable trough should be placed across the front of each coop. This eliminates the necessity of opening the coop in feeding and also keeps the birds from trampling in their feed. Ease in cleaning is another item in favor of this kind of a feeding device and the birds can easily eat by poking their heads between the slats on the front of the croop.

It is well too, to have clean, dry, well ventilated and temperate rooms in which to do the feeding. A concreted basement makes an ideal feeding room provided that it is airy and dry and that it can be kept at about sixty egrees Fahrenheit. The idea in fattening fowls is to make them eat as much food as possible and to do this they must be kept in sanitary quarters where they will be protected from draughts and from excess of either heat or cold. Nothing will take a bird off feed any quicker than will a warm, stuffy or damp fattening room.

Feeds to Use

For fattening, birds, like steers, should be selected for feeder type. A weak fowl will not make a good feeder any more than will a scrub steer. Vigorous, shapely birds make the best feeders and the best gainers and scrub fowls should not be put into the fattening pen.

As to the feeds to be used the main thing to remember is that meat is the one thing that is wanted and that fat is not necessarily meat. An all grain ration tends to lay on fat rather than meat and fat which is placed on the bird in lumps has but little value in making the flesh tender and juicy. Another mistake that is sometimes made is that of feeding a laying ration to birds which are intended for fattening.

Probably no feed is better for fattening than is buttermilk when it is properly combined with other feeds. Milk fed birds will lay on their fat as will not other fowl. Instead of putting it on in great lumps it seems to run the flesh and fat together and the result is a plump fowl with firm yet tender and juicy flesh. This, in the eyes of the consumer is the most desirable combination that can be had.

Two pounds of buttermilk to every poung of grain fed is a good ratio for fattening fowls. Purdue uses a ration consisting of 1 pound of shorts, 1 pound of ground oats and 2 pounds of corn meal to which is added 8 pounds of buttermilk.

Time to Feed

The best manner of feeding this ration is to mix the buttermilk with the grain and shorts and to allow the mixture to stand for twelve hours. As the fowls are fed twice a day, preferably at six in the morning and again at six at night, the ration may be mixed after each feeding and allowed to sour until time for the next feed. In this manner over-souring is prevented along with the consequent disorders which may arise from feeding such a ration.

Feed should not be left before the birds longer than thirty minutes. The reason for this is that by feeding only twice a day and by keeping the birds hungry they will eat more than if permitted to gorge themselves at feeding time. Where feed is left before them they will eat off and on and never become so ravenously hungry that they will overeat. Water is not necessary excepting in very warm weather.

Two weeks is the customary length of the feeding period but no length of time can be given as exact. The birds should be killed when they are "ripe" just as with any other crop. This may seem like a strange word to use in conjunction with the poultry crop but a bird is ripe when it has attained good flesh. At this time he will lose the red color and his face will become a pale pink. Birds that have become ripe are ready to kill.

This is best done by the sticking and bleeding method. Experimental date seems to point to this as the best method of killing as the birds may then be dry picked without tearing the skin provided the killing has been properly done. Cutting off the head, unless for local markets or immediate consumption but opens up the way for the germs of decay to enter. It is far better to leave the dead bird with the head as well as the intestines intact as this gives less chance of spoilage than where the skin has been broken. Broken bones should always be avoided.

The main points to remember in fattening market poultry are that good feeders should be selected and that the birds should be kept on feed from the very start to the en of the fattening period. Feed which has become too sour may cause diarrhoea or warm feeding quarters may detract from the bird's appetite. Less moisture in the food or a little tallow added to the ration will serve to correct the former ailment and cooler quarters is the corrective should the lost appetite be due to the latter. A little charcoal may also help to correct the ailment. This may be mixed in with the ration.

At all times the bird should exhibit ravenous appetites and should eat greedily. Unless they do this something is at fault; either with the manner of feeding or with the kinds and qualities of the feeds used.

Correct the fault, whatever it may be, and turn out well fattened birds that will bring the highest prices on the markets. Fattened fowls bring the top prices and it is just as well for the producer to have this margin of profit as it is to give it to the commercial poultry fattener.

PEERLESS GATES
Down the road or far across the fields is often an "entrance," a mere hole in the fence, a constant source of danger to stock getting through. The best way to
Keep Your Stock Where You Want Them
is to provide real gates, strong and durable. All Peerless Farm Gates are of heavy open hearth steel wire on strong tubular steel frames electrically welded in one solid piece, and braced like a steel bridge. No sag, no rust, no wearing out. Ask your dealer to show you Peerless Gates, also Peerless Perfection Farm and Poultry fencing with the famous Peerless lock at all intersections.

POULTRY HOUSE CLEANING THAT WILL INCREASE EGG-PRODUCTION AND PROFITS

Many of the diseases which cut down farm poultry profits can be traced to a lack of sanitation in the houses. We have found that the open-front house is the first step in the prevention of disease. Hens need plenty of fresh air and they can stand a cold temperature. It is damp, impure air and draughts which cause colds and roup and devitalized flocks. The house with the open front and the tight back and sides insures a good supply of fresh air and it will not be damp if it is kept clean. Old burlap sacks can be used on frames and these cheaply made curtains can be lowered on extremely cold nights or when the storms are blowing from the south.

In maintaining the house in a sanitary condition we can begin with the floor. It must be raised sufficiently above the outside ground to keep out the moisture. If the foundation of the house is of cement, and the cement wall extends a foot above the ground, it pays to fill in that extra foot with gravel and sand, and in that way insure a dry floor. Cement makes an excellent floor when thickly covered with litter, but an earth floor will be satisfactory in the farm poultry house. If the cement wall extends deep enough into the ground to keep out rats.

The litter should be emptied into the house until it is about one foot deep. The birds will soon scratch it to pieces and work it down to a depth of about four to six inches. Wheat or oat straw makes an excellent litter. Shredded corn foder is also used by some poultry men, and it does not seem to be broken up as rapidly as straw. When the litter becomes tough and slightly moist, we know that it is fine fertilizer, but unsafe to leave in the poultry house, and it is removed and spread on the berry patch, or on some field requiring the fertility. Dirty litter is the cause of many sick birds during the winter, and it costs very little to change the litter on the farm where there is usually an abundance of straw.

The dropping board is necessary, and it should be cleaned every day. Hang a bushel basket and a hoe on convenient nails in the poultry house, and make it a regular duty to clean the board immediately after feeding the birds. The droppings can be stored in barrels behind the house, until they are ready to be spread on the garden. When a dropping board is not very carefully constructed of matched lumber, there will be many cracks remaining to catch the dirt and form breeding places for mites. Covering the board with heavy roofing paper will assist in keeping it clean for at least one year.

The roosts should be smoothly planed "two by three's" attached to cross-pieces which can be hinged to the rear wall of the house. When cleaning or spraying the dropping boards the roosts can be raised and hooked to the ceiling. This enables the poultryman to thoroughly spray the under side of the roosts where mites are especially apt to hide. We have found that the mite problems consists in protecting the roosts. If we paint new roosts thoroughly with kerosene oil and then renew the application once each week in the summer and once each month in the winter we have found that there is absolutely no trouble from mites. Some breeders add one part of crude carbolic acid to ten parts of the kerosene and find that it is slightly more effective. This mixture makes a cheap and efficient disinfectant for spraying the entire house. The barrel orchard sprayers are desirable for spraying poultry houses. Some breeders attempt to spray their houses with small hand potato sprayers but this means hard unnecessary work and results are often unsatisfactory. Whitewash is still used on many farms and it gives the interior of the houses a clean bright appearance. However we have found that the whitewash has a tendency to make the house slightly damp and we believe that the oil sprays are more effective and less expensive to apply.

The feeding utensils are frequently disease carriers. Water pails should be scalded frequently and placed on a low table where they will not be

MINARD'S

scratched full of litter. When wet mash is fed in troughs, the troughs should be hinged to the wall, so that they can be protected from the litter after feeding time. They should also be carefully cleaned at frequent intervals. Buttermilk and sour milk should be fed in ordinary crocks, as they are heavy and not easily tipped over, and they can be scalded without danger of breakage. These crocks should also be placed on the table, to protect them from the dirt, when the birds are scratching in the litter.

Perhaps the most important point in keeping a house in a sanitary condition is to breed from strong, vigorous stock and keep the birds free from lice. We treat every bird with blue ointment twice each year by rubbing in a piece beneath the vent about the size of a pea and then giving a slight smear under each wing. I have never seen lice in poultry houses unless they were also on the birds and by protecting our birds with the blue ointment we have found that our lice troubles end immediately.

Placing permanganate in the drinking water until it is a dark crimson will assist in preventing the spread of colds and this is an important factor in keeping the house in a sanitary condition. Poultry houses require constant attention if the flocks are maintained in the healthy condition which brings profit to the farmer. It only takes a short time each year to carry on the system of sanitary management which makes the farm flock an important item in the yearly income. It simply means an hour here and there and a few half days with the team, and while the work can never be neglected entirely it really does not take an exorbitant amount of time compared with the satisfaction and profit to be derived from a healthy flock in a sanitary house.

R. G. KIRBY.

THE FARM FLOCK

(By George Robertson, Poultry Division, Department of Agriculture.)

As It Was.—It is but a comparatively short time since farmers regarded the keeping of fowl as something beneath their notice. What fowls were allowed on the premises, were looked after by the women of the house when they could get time, or were not looked after at all, roosting any place round the outbuildings where they could get the best shelter, and often going hungry in the winter, simply because the farmer regarded as wasted, the food they consumed.

As It Is—However owing to the high prices paid for new laid eggs and high class poultry, the fact that it is now possible to get cash for these products instead of store trade; many farmers have turned their attention to the one time disposed hen and opinion has so changed tha tthe poultry work is now regarded as the most profitable on the farm.

As It Should Be.—Every farm should have its flock of fowl, the size will depend on conditions and the individual taste of the owner. One hundred may be regarded as suitable for ordinary conditions and these should be as well housed and as carefully tended as any other live stock on the farm.

The Manager.—It will be found that where some one person is placed in charge of the flock that better results will be obtained. An able bodied boy or girl if given some share of the profits as an incentive, will, with a little guidance, usually make an ideal manager and it will also hep to interest them in farm work.

The Flock

It is not advisable to keep hens of the Rock type after they are two years old except in cases where individuals have proven to be of special value as breeders. Pullets are much easier to keep in laying condition, and usually will produce more eggs than hens, so that it is advisable to raise enough early chicks each year to renew at least half the flock. As fifty per cent. of the chicks raised will be cockerels, it may readily be seen that allowing for culling it will be necessary to raise more than twice the number of rhisks, as pullets required. Get the chicks hatched early in the season, as early chicks mean well developed pullets in the fall, and well developed pullets, properly handled mean winter eggs. It is the winter egg production that will to a large extent determine the profit on the season's work.

Kind to Keep

The question is frequently asked what is the best kind. The best kind for any individual, is the kind best suited to his conditions, but whatever variety is decided on, keep it pure so as to have uniformity in products. Under special conditions where eggs are to be the chief product, it may be advisable to keep one of the lighter breeds, such as the Leghorns, but for ordinary farm use one of the "general purpose" breeds such as the Rocks or Wyandottes will give the best results, as they will give good return in both eggs and market poultry.

Getting a Start

The best way to get a start depends on the time of year. If in the spring either day old chicks or hatching eggs may be purchased. These should be secured from a reliable breeder. In purchasing, don't ask for exhibition quality, if it is just utility stock that is required. So long as the stock you get is from a flock of large vigorous birds that are producers of even sized eggs, never mind about the finer points that are required in exhibition specimens. If in the fall, get a pen of vigorous early hatched pullets, or a pen of young hens that has been used for breeding purposes the past season. A vigorous early hatched cockerel is generally more reliable as a breeder than an older male.

Feeding

To secure the best results in feeding it is necessary to separate the hens from the pullets, as what will give good results with pullets will make the old hens too fat. There are many methods of feeding and each individual must decide for himself just what plan he will follow. The old fashioned method was to feed moist mash, but of late owing to the high price of labor, poultrymen, seeking for methods that would reduce cost of production, have found that the dry food system gives good results and so have very largely adopted it. In this system the ground grains are mixed, just as they would be in making the old style mash, but instead of getting enough for each feeding, enough of the mixture to last some time is placed in a hopper, where the hens can have free access to it, or a hopper can made with a hinged, cover so that it may be opened or closed at will. The whole grain is fed in the litter as under the old system. So long as the requirements are supplied the simpler method of feeding can be made the better. Pure water should be accessible at all times, sound grains in variety, meat in some form, green food and grit. Sour milk can be had on most farms and nothing gives better results for either raising chicks or feeding the layers. When the fowl are in confined quarters, feed them so that they will be eager for the grain feed, which should be thrown in a deep litter so as to keep them busy.

Marketing.

No matter how successfully production is managed the profit will to a great extent depend on the marketing. The ideal method is where the producer can sell direct to the consumer; if it is impossible on account of location to do this, aim to market so as to have as few middle men as possible. If you are not situated close to a good retail market, probably the co-operative egg circle method will be best. But under any system, care should be taken to market only high class products. If you are shipping to a circle send nothing but strictly new laid eggs of good size and color. If you have any eggs that are small or of uncertain age keep them at home for cooking, as the marketing of them will spoil your reputation and the price for your good eggs. If you are supplying private trade it will aid yu to better prices if they are put up in neat cartons on which is printed your name and any other information that may be thought advisable. The same care should be taken in marketing table poultry; see that it is properly fleshed and if sold dead that it is neatly dressed.

Endeavor to make every month of the year a selling month. Sell the surplus cockerels from your early hatches for broilers when the price is high, rather than hold them till fall and sell at a lower price as roasters. As soon as the breeding season is over sell off the old hens; they will fill in a gap between the time the broilers have finished, and the time the roasters are ready. They will bring much better prices than if held until the fall and they will not crowd the market, at the time the roasters are being sold, thus avoiding the glut and low prices usual at that time of the year.

BUT little over a year ago, when the through tri-weekly service between Quebec and Winnipeg was inaugurated, it was predicted it would not be long before the equipment then adopted —a buffet sleeping car—would soon outlive its limited accommodation and warrant a more modern and commodious service. That day has arrived, and the "Western National," leaving Quebec 4.30 p.m., Tuesday, Thursday and Saturday, arriving Winnipeg 6.00 p.m., Thursday, Saturday and Monday, now carries as part of its regular equipment a through standard electrically lighted sleeping and dining car.

The eastbound train—the "National Atlantic"—is similarly equipped.

The "Nationals" via the shortest route between Quebec and the Prairie City are catering to an ever increasing travel, and the latest improvements, which make them modern trains in every respect, will no doubt add to their popularity.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

SALLY ANN'S EXPERIENCE

By Eliza Calvert Hall

"Come right in an' set down. I was jest wishin' I had somebody to talk to. Take that chair right by the door so's you can get the breeze."

And Aunt Jane beamed at me over her silver-rimmed spectacles and hitched her own chair a little to one side, in order to give me the full benefit of the wind that was blowing softly through the white-curtained window, and carrying into the room the heavenliest odors from a field of clover that lay in full bloom just across the road. For it was June in Kentucky, and clover and bluegrass were running in sweet riot over the face of the earth.

"Yes, I'm a-piecin' quilts again," she said, snipping away at the bits of calico in her lap. "I did say I was done with that sort o' work; but this mornin' I was rummagin' around up in the garret, an' I come across this bundle of pieces, an' thinks I, 'I reckon it's intended for me to piece one more quilt before I die;' I must 'a' put 'em there thirty years ago an' clean forgot 'em, an' I've been settin' here all the evenin' cuttin' 'em an' thinkin' about old times.

"Jest feel o' that," she continued, tossing some scraps into my lap. "They ain't no such caliker nowadays. This ain't your five-cent stuff that fades in the first washin' an' wears out in the second. A caliker dress was somethin' worth buyin' an' worth makin' up in them days. That blue-flowered piece was a dress I got the spring before Abram died. When I put on mournin' it was as good as new, an' I give it to sister Mary. That one with the green ground and white figger was my niece Rebecca's. She wore it the first time to the country Fair the year I took the premium on my salt-risin' bread an' sponge cake. This black an' white piece Sally Ann Flint give me. I ricollect 'twas in blackberry time, an' I'd been out in the big pastur' pickin' some for supper, an' I stopped in at Sally Ann's for a drink of water on my way back. She was cuttin' out this dress." Aunt Jane broke off with a little soprano laugh.

"Did I ever tell you about Sally Ann's Experience?" she said, as she laid two three-cornered pieces together and began to sew with her slender, nervous old fingers.

To find Aunt Jane alone and in a reminiscent mood! This was delightful.

"Do tell me," I said.

Aunt Jane was silent for a few moments. She always made this pause before beginning a story, and there was something impressive about it. I used to think she was making an invocation of the goddess of Memory.

"'Twas forty years ago," she began musingly, "an' the way of it was this. Our church was considerably out o' fix. It needed a new roof. Some o' the winder lights was out, an' the floor was bare as your hand, an' always had been. The men-folk managed to git the roof shingled an' the winders fixed, an' us women in the Mite Society concluded we'd git a cyarpet. We'd been savin' up our money for some time, an' we had about twelve dollars. I ricollect what a argument we had, for some of us wanted the cyarpet, an' some wanted to give it to furrin missions, as we'd set out to do at first. Sally Ann was the one that settled it. She says at last—Sally Ann was in favor of the cyarpet—she says, 'Well, if any of the heathen fails to hear the Gospel on account of our gittin' this cyarpet, they'll be saved anyhow, so Parson Page says. An' if we send the money an' they do hear the Gospel like as not they won't repent, an' then they're certain to be damned. An' it seems to me as long as we ain't sure what they'll do, we might as well keep the money an' git the cyarpet. I never did see much sense anyhow,' she says, 'in givin people a chance to damn themselves.'

"Well, we decided to take Sally Ann's advice, an' we was talkin' about app'intin' a committee to go to town the follerin' Monday an' pick out the cyarpet, when all at once 'Lizabeth Taylor—she was our treasurer—she spoke up, an' says she, 'They ain't no use app'intin' that committee. The money's gone,' she says, sort o' short and quick. 'I kep' it in my top bureau drawer, an' when I went for it yistiddy, it was gone. I'll pay it back if I'm ever able, but I ain't able now.' An' with that she got up an' walked out o' the room, before anyone could say a word, an' we seen her goin' down the road lookin' straight before her an' walkin' right fast.

"An' we—we set there an' stared at each other in a sort o' dazed way. I could see that everybody was thinking the same thing, but nobody said a word, till our minister's wife—she was as good a woman as ever lived—she says, 'Judge not.'"

"An' them two words was jest like a sermon to us. Then Sally Ann spoke us an' says. 'For the Lord's sake don't let the men-folks know anything about this. They're always sayin' that women ain't fit to handle money, an' I for one don't want to give 'em no more ground to stand on than they've already got.'

"So we agreed to say nothin' about it, an' all of us kept our promise except Milly Amos. Hhe had mighty little sense to begin with an' havin' been married only about two months, she'd about lost that little. So next mornin' I happened to meet Sam Amos an' he says to me, 'Aunt Jane, how much money have you women got to'rds the new cyarpet for the church?' I looked him square in the face, an' I says, 'Are you a member of the Ladies' Mite Society of Goshen Church, Sam Amos? 'Cause if you are, you already know how much money we've got, an' if you ain't, you've got no business knowin'. An' furthermore,' says I, 'there's some women that can't keep a secret an' a promise, an' some that can, an' I can., An' that settled him.

"Well, 'Lizabeth never showed her face outside her door for more'n a month afterwards, an' a more pitiful-lookin' creatur' you never saw than she was when she come out to prayer-meetin' the night Sally Ann gave her experience. She set 'way back in the church, an' she was as pale and peaked as if she had been through a siege of typhoid. I ricollect it all as if it had been yesterday. We'd sung 'Welcome Sweet Hour,' an' Parson Page prayed a pra'r, an' then called on the brethern to say anything they might feel called on to say concernin' their experience in the past week. Old Uncle Jim Matthews begun to clear his throat an' I knew as well as I knew my name he was fixin' to git up an' tell how precious the Lord had been to his soul, jest like he'd been doin' every Wednesday night for twenty years. But before he got started, here comes 'Lizabeth walkin' down the side aisle an' stopped right in front of the pulpit.

"'I've somethin' to say,' she says. 'It's been on my mind till I can't stand it any longer. I've got to tell it, or I'll go crazy. It was me that took that cyarpet money. I only meant to borry it. I thought sure I'd be able to pay it back before it was wanted. But things went wrong, an' I ain't known a peaceful minute since, an' never shall again, I reckon. I took it to pay my way up to Louisville, the time I got the news that Mary was dyin'."

"Mary was her daughter by her first husband, you see. 'I begged Jacob to give me the money to go on,' says she, 'an' he wouldn't do it. I tried to give up and stay, but I jest couldn't. Mary was all I had in the world; and maybe you that has children can put yourself in my place an' know what it would be to hear your only child callin' to you from her deathbed an' you not able to go to her. I asked Jacob three times for the money,' she says, 'an' when I found he wouldn't give it to me, I said to myself, "I'm goin' anyhow." I got down on my knees,' says she, 'an' asked the Lord to show me a way, an' I felt sure he would. As soon as Jacob had eat his breakfast an' gone out on the farm, I dressed myself, an' as I opened the top bureau drawer to get out my best collar, I saw the missionary money. It come right into my head,' says she, "that maybe this was the answer to my prayer; maybe I could borry this money an' pay it back some way or other before it was called or. I tried to put it out o' my head, but the thought kept comin' back; an' when I went down into the sittin' room to get Jacob's cyarpet-sack to carry a few things in, I happened to look up at the mantelpiece, an' saw the brass candlesticks with prisms all 'round 'em that used to belong to my mother; an' all at once I seemed to see jest what the Lord intended for me to do.

"'You know,' she says, 'I had a boarded summer before last—that lady from Louisville, an' she wanted them candlesticks the worst kind, an' offered me fifteen dollars for 'em. I wouldn't part with 'em then, but she said if ever I wanted to sell 'em, to let her know, an' she left her name an' address on a cyard. I went to the big Bible an' got out the cyard, an' I packed the candlesticks in the cyarpetbag, an' put on my bonnet. When I opened the door I looked up the road, an' the first thing I saw was Dave Crawford comin' along in his new buggy. I went out to the gate an' he drew up an' asked me if I was goin' to town, an' said he'd take me. It looked like the Lord was leadin' me all the time,' says she, 'but the way things turned out it must 'a' been Satan. I got to Mary just two hours before she died, an' she looked up in my ace and says, "Mother, I knew God wouldn't let me die till I'd seen you once more."'"

Here Aunt Jane took off her glasses and wiped her eyes. "I can't tell this without cryin' to save my life," said she; "but 'Lizabeth never shed a tear. She looked like she'd got past cryin' and she talked straight on as if she'd made up her mind to say jest so much, an she'd die if she didn't get to say it. Well.

"'As soon as the funeral was over,' says she, 'I set out to find the lady that wanted the candlesticks. She wasn't at home, but her niece was there, an' said she'd heard her aunt speak of the candlesticks often; and she'd be home in a few days and would send me the money right off. I come home thinkin' it was all right, an' I kept expectin' the money every day, but it never come till day before yesterday. I wrote three times about it, but I never got a word from her, till Monday. She had jest got home, she said, and hoped I hadn't been inconvenienced by the delay. She wrote a nice, polite letter and sent a cheque for fifteen dollars, and here it is. I wanted to confess it all that day at the Mite Society, but somehow I couldn't till I had the money right in my hand to pay back. If the lady had only come back when her niece said she was comin', it would all have turned out right, but I reckon it's a judgment on me for meddling with the Lord's money. God only knows what I've suffered,' says she, 'but if I had it to do over again, I believe I'd do it. Mary was all the child I had in the world, and I had to see her once more before she died. I've been a member of this church for twenty years,' says she, 'but I reckon you'll have to turn me out now.'

"The pore thing stood there tremblin' an' holdin' out the cheque as if she expected somebody to come and take it. Old Silas Petty was glowerin' at her from under his eyebrows, and it put me in mind of the Pharisees and the woman they wanted to stone, and I ricollect thinkin', 'O if the Lord Jesus would jest come in and take her part!' And while we all set there like a passel o' mutes, Sally Ann got up and marched down the middle aisle and stood right by 'Lizabeth. You know what funny thoughts people will have sometimes.

"Well, I felt so relieved. It popped into my head all at once that we didn't need the Lord after all. Sally Ann would do jest as well. It seemed sort o' like sacrilege, but I couldn't help it.

"Well, Sally Ann looked all around as composed as you please and says she, 'I reckon if anybody's turned out o' this church on account o' that miserable little money, it'll be Jacob and not 'Lizabeth. A man that won't give his wife money to go to her dyin' child is too mean to stay in a Christian church anyhow; and things is come to a pretty pass in this state when a woman that had eight hundred dollars when she married has to go to her husband and git down on her knees an beg for what's her own. Where's that money 'Lizabeth had when she married you?' says she, turnin' round and lookin' Jacob in the face. 'Down in that ten-acre medder lot, ain't it?—an' in that new barn

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

WAS TROUBLED WITH INDIGESTION

COULD KEEP NOTHING ON STOMACH.

Indigestion is one of the worst forms of stomach trouble. The stomach becomes upset and you have a raw debilitated feeling in it.

It is not necessary for you to be troubled with indigestion if you will only use that old and well-known remedy Burdock Blood Bitters, which will regulate the stomach so that you may eat what you wish without any ill after effects.

Mrs. Wm. C. Smith, Marshville, Ont., writes:—"I cannot speak too highly of Burdock Blood Bitters; it is worth its weight in gold. I was troubled with indigestion, and was so bad I could not keep anything on my stomach. A friend advised me to try B.B.B. which I did, and I never felt better in my life."

Burdock Blood Bitters has been manufactured by The T. Milburn Co., Limited, Toronto, Ont., for over 40 years. You do not experiment when you buy it.

you built last spring. A pretty elder you are, ain't you? Elders don't seem to have improved much since Susannah's times. If there ain't one sort o' meanness in 'em it's another,' says she. Goodness knows what she would 'a' aid, but jest here old Deacon Petty rose up. And says he, 'Brethern'—and he spread his arms out and waved 'em up and down like he was goin' to pray—'brether, this is awful! If this woman wants to give her religious experience, why,' says he, very kind and condescendin', 'of course she can do so. But when it comes to a woman standin' up in the house of the Lord and revilin' an elder as this woman is doin', why, I tremble,' says he, 'for the church of Christ. For don't the Apostle Paul say, "Let your women keep silence in the church"?'

"As soon as he named the 'Postle Paul, Sally Ann give a kind of snort. Sally Ann was turrible free-spoken, and I've heard her say many a time that she had as little use for the 'Postle Paul as she had for Judas Iscariot. And when Deacon Petty said that, she jest squared herself like she intended to stand there till jedgment day, and says she, 'The 'Postle Paul has been dead ruther too long for me to be afraid of him. And I never heard of him app'intin' Deacon Petty to represent him in this church. If the 'Postle Paul don't like what I'm sayin', let him rise up from his grave in Corinthians or Ephesians, or wherever he's buried, and say so. I've got a message from the Lord to the men-folks of this church, and I'm goin' to deliver it. Paul or no Paul,' says she. 'And as for you, Silas Petty, I ain't forgot the time I dropped in to see Maria one Saturday night and found her washin' out her flannel petticoat an' dryin' it before the fire. And every time I've had to hear you lead in prayer since then I've said to myself, "Lord, how high can a man's prayers rise toward heaven when his wife ain't got but one flannel skirts to her name? No higher than the back of his pew, if you'll let me tell it." I knew jest how it was,' said Sally Ann, 'as well as if Maria 'd told me. She'd been havin' the milk and butter money from the old roan cow she'd raised from a little heifer, and jest because feed was scarce, you'd sold her off before Maria had money enough to buy her winter flannels. I can give my experience, can I? Well, that's jest what I'm a-doin',' says she; 'an' while I'm about it,' says she, 'I'll give in some experience for 'Lizabeth an' Maria an' the rest of the women who betwixt their husbands an' the 'Postle Paul have about lost all the gumption and grit that the Lord started them out with. If the 'Postle Paul,' says she, 'has got anything to say about a woman workin' like a slave for twenty-five years an' then havin' to set up an' wash out her clothes Saturday night so's she can go to church clean Sunday mornin', I'd like to hear it. But don't you dare to say nothin' to me about keepin' silence in the church. There was times when Paul says he didn't know whether he had the spirit of God or not, an' I'm certain that when he wrote that text he wasn't no more inspired than you are, Silas Petty, when you tell Maria to shut her mouth.'

"Job Taylor was settin' right in front of Deacon Petty, an' I reckon he thought his time was comin' next; so he gets up easy-like with his red bandana to his mouth, an' starts out. But Sally headed him off before he'd gone six steps, an' says she, 'There ain't nothin' the matter with you, Job Taylor; you set right own an' hear what I've got to say. I've knelt an' stood through enough o' your long-winded prayers, an' now it's my time to talk an' yours to listen.'

"An' bless your life, if Job didn't set down as meek as Moses, an' Sally Ann lit right into him. An' says she, 'I reckon you're afraid I'll tell some o' your meanness, ain't you? An' the only thing that stands in my way is that there's so much to tell I don't know where to begin. There ain't a woman in this church,' says she, 'that don't know how Marthy scrimped and worked and saved to buy her a new set o' furniture, an' how you took the money with you when you went to Cincinnati the spring before she died, an' come back without the furniture. An' when she asked you for the money, you told her that she and everything she had belonged to you, and that your mother's old furniture was good enough for anybody. It's my belief,' says she, 'that's what killed Marthy. Women are dyin' every day an' the doctors will tell you it's some new-fangled disease or other, when, if the truth was known, it's nothin' but wantin' somethin' they can't get, an' hopin' an' waitin' for somethin' that never comes. I've watched 'em an' I know. The night before Marthy died she says to me, "Sally Ann," sasy she, "I could die a heap peacefuller if I jest knew the front room was fixed up right with a new set of furniture for the funeral." ' An' Sally Ann p'inted her finger right at Job an' says she, 'I said then an' I say it now to your face, Job Taylor, you killed Marthy the same as if you'd taken her by the throat and choked the life out of her.'

"Mary Embry, Job's sister-in-law, was settin' right behind me, an' I heard her say 'Amen!' as fervent as if somebody had been prayin'. Job set there lookin' like a sheep-killin' dog, an' Sally Ann went right on.

"'I know,' says she, 'the law gives you the right to think they've got down to the clothes on their backs; an' I've always said there was some Kentucky law that was made for the express purpose of encouragin' men in their natural meanness—a p'int in which, the Lord knows they don't need no encouragin'. There's some men,' says she, 'that'll sneak behind the 'Postle Paul when they're plannin' any meanness against their wives, an' some that runs to the law, an' you're one of the law kind. But mark my words,' says she, 'one of these days you men who've been stealin' your wives' property an' defraudin' 'em, an' cheatin' 'em out of their just dues, you'll have to stand before a judge that cares mighty little for Kentucky law; an' all the law and scripture you can bring up won't save you from goin' where the rich man went.'

"I can see Sally Ann right now," and Aunt Jane pushed her glasses up on her forehead and looked with a dreamy, retrospective gaze through the oorway and beyond, where swaying elms and maples were whispering

Economy Begins at Home

Now-a-days Governments, Chancellors, bankers and business men talk economy, However, it is one thing to talk economy and another to put it into practice.

The Canadian Housewife

holds the key to the situation. Real economy may be practised by the housewife in food purchasing for the home. At very small cost she may obtain the finest cocoa that money can buy — a cocoa unexcelled as a food drink and unrivalled as a flavoring, that adds extra delight to hundreds of dainty desserts.

softly to each other as the breeze touched them. "She had on her old black poke-bonnet and some black yarn mitts, an' she didn't come nigh up to Job's shoulder, but Job set an' listened as if he jest had to. I heard Dave Crawford shufflin' his feet an' clearin' his throat while Sally Ann was talkin' to Job. Dave's farm j'ined Sally Ann's, an' they had a lawsuit once about the way a fence ought to run, an' Sally Ann beat him. He always despised Sally Ann after that, an' used to call her a 'he-woman.' Sally Ann heard the shufflin', an' as soon as she got through with Job she turned round to Dave, an' says she: 'Do you think your hemmin' an' scrapin' is goin' to stop me, Dave Crawford? You're one o' the men that makes me think that it's better to be a Kentucky horse than a Kentucky woman. Many's the time,' says she, 'I've seen pore July with her head tied up crawlin' around tryin' to cook for sixteen harvest hands, an' you out in the stable cossetin' up a sick mare an' rubbin' down your three-year-olds to get 'em in trim for the fair. Of all the things that's hard to understand,' says she, 'the hardest is a man that has more mercy on his hore than he has on his wife. July's found rest at last,' says she, 'out in the graveyard; an' every time I pass your house I thank the Lord you've got to pay a good price for your cookin' now, as there ain't a woman in the country fool enough to step into July's shoes.'

"But, la!" said Aunt Jane, breaking off with her happy laught—the laugh of one who revels in rich memories—"what's the use of me tellin' all this stuff? The long and the short of it is that Sally Ann had her say about nearly every man in the church. She told how Mary Embry had to cut up her weddin' skirts to make clothes for her first baby; an' how John Martin stopped Hannah one day when she was carryin her mother a pound of butter, an' made her go back an' put the butter down in the cellar; an' how Lije Davidson used to make Ann pay him for every bit of chicken feed, an' then take half the egg money because the chickens got into his garden, an' how Abner Page give his wife twenty-five cents for spendin' money the time she went to visit her sister.

"Sally Ann always was a masterful ort of woman, an' that night it seemed like she was possessed. The way she talked made me think of the day of Pentecost, an' the gift of tongues. An' finally she got to the minister. I'd been wonderin' all along if she was goin' to let him off. She turned around to where he was settin' under the pulpit an' says she, 'Brother Page, you're a good man, but you ain't so good you couldn't be better. It was jest last week,' says she, "that the women come around beggin' money to buy you a new suti of clothes to go to Presbytery in; an' I told 'em if it was to get Mrs. Page a new dress, I was ready to give; but not a dime was I goin' to give towards puttin' finery on a man's back. I'm tired o' seein' the ministers walk up into the pulpit in their slick black broadcloths, an' their wives sittin' down in the pew in an old black silk that's been turned upsde down, wrong side out an' hind part before, an' sponged an' pressed an' made over till you can't tell whether it's silk or calliker or what.'

"Well, I reckon there was some o' the women that expected the roof to fall down on us when Sally Ann said that right to the minister. But it didn't fall, an' Sally Ann went straight on. 'An' when it comes to the perseverance of the saints an' the decrees of God,' says she, 'there ain't many can preach a better sermon; but there's some of your sermans,' says she, 'that ain't fit for nothin' but kindlin' fires. There's that one you preached last Sunday on the twenty-fourth verse of the fifth chapter of Ephesians. I reckon I've heard about a hundred an' fifty sermons on that text, an' I reckon I'll keep on hearin' 'em as long as there ain't nobody but men to do the preachin'. Anybody would think,' says she, 'that you preachers was struck blind every time you git through with the twenty-fourth verse, for I never heard a sermon on the twenty-fifth verse. I believe there's men in this church that thinks the fifth chapter of Ephesians hasn't got but twenty-four verses, an' I'm going to read the rest of it to 'em for once anyhow.'

"An' if Sally An didn't walk right up into the pulpit same as if she'd been ordained, an' read what Paul said about men lovin' their wives as Christ loved the church, an' as they loved their own bodies.

"'Now,' says she, 'if Brother Page can reconcile these texts with what Paul says about women submittin' an' bein' subject, he's welcome to do it. But,' says she, 'if I had the preachin' to do, I wouldn't waste no time reconcilin'. I'd jest say that when Paul told women to be subject to their husbands in everything, he wasn't inspired; an' when he told men to love their wives as they loved their own bodies, he was inspired; an' I'd like to see the Presbytery that could silence me from preachin' as long as I wanted to preach. As for turnin' out o' the church,' says she, 'I'd like to know who's to do the turnin' out. When the disciples brought that woman to Christ there wasn't a man in the crowd fit to cast a stone at her; an' if there's any man nowadays good enough to set in judgment on a woman, his name ain't on the rolls of Goshen Church. If 'Lizabeth,' says she, 'had as much common sense as she's got conscience, she'd know that the matter o' that money didn't concern nobody but our Mite Society, an' we women can settle it without any help from you deacons and elders."

"Well, I reckon Parson Page thought if he didn't head Sally Ann off some way or other she'd go on all night; so when she kind o' stopped for breath and shut up the big Bible, he grabbed a hymn-book an' says,

"'Let us sing, "Blest Be the Tie That Binds."'

"He struck up the tune himself; an' about the middle of the first verse Mis' Page got up an' went over to where 'Lizabeth was standin', an' give her the right hand of fellowship, an' then Mis' Petty did the same; an' first thing we knew we was all around her shakin' hands an' huggin' her an' cryin' over her. 'Twas a reg'lar love-feast; and we went home feelin' like we'd been through a big protracted meetin' and got religion over again.

"'Twasn't more'n a week till 'Lizabeth was down with slow fever—nervous collapse, old Doctor Pendleton called it. We took turns nussin' her, and one day she looked up in my face and says, 'Jane, I know now what the mercy of the Lord is.'"

Here Aunt Jane paused and began to cut three-cornered pieces out of a time-stained square of flowered chintz. The quilt was to be of the wild-goose pattern. There was a drowsy hum from the beehive near the window, and the shadows were lengthening as sunset aprpoached.

"One queer thing about it," she resumed, "was that while Sally Ann was talkin', not one of us felt like laughin'. We set there as solemn as if parson was preachin' to us on 'lection and predestination. But whenever I think about it now, I laugh fit to kill. And I've thought many a time that Sally Ann's plain talk to them men done more good than all the sermons us women had preached to us about bein' 'shamefaced' and 'submittin'' ourselves to our husbands, for every one o' them women came out in new clothes that spring, an' such a change as it made in some of 'em. I wouldn't be surprised if she did have a message to deliver, jest as she said. The Bible says an ass spoke up once an' reprov-a man, an' I reckon if an ass can reprove a man, so can a woman. An' it looks to me like men stand in need of reprovin' now as they did in Balaam's days."

"How about you and Uncle Abram?" I suggested. "Didn't Sally Ann say anything about you in her experience?"

Aunt Jane's black eyes snapped with some of the fire of her long-past youth. "La!, no, child," she said. "Abram never was that kind of a man, an' I never was that kind of a woman. I ricollect as we was walkin' home that night Abram says, sort of humble-like: 'Jane, hadn't you better git that brown merina you was lookin' at last County Court day?'

"An' I says, 'Don't worry about that brown merino, Abram. It's a-lyin' in my bottom drawer right now. I told the storekeeper to cut it off jest as soon as your back was turned, and Mis' Simpson is goin' to make it next week.' And Abram he jest laughed and says, 'Well, Jane, I never saw your beat.' You see, I never was no hand at 'submittin'' myself to my husband like some women. I've often wondered if Abram wouldn't 'a' been jest like Silas Petty, if I'd been like Maria. I've noticed that whenever a woman's willin' to be imposed upon, there's always a man standin' 'round ready to do the imposin'. I never went to no lawbook to find out what my rights was. I did my duty faithful to Abram, and when I wanted anything I went and got it, and Abram paid for it, and I can't see but what we got on jest as well as we'd 'a' done if I'd a-'submitted' myself."

RHEUMATISM

Needs Strong Medicine Decided Syracuse Man Who Suffered 36 Years Before, At Last He Found A Cure.

WILL SEND FREE TO ALL WHO SUFFER

"You can't cure Rheumatism with linaments, cheap uric acid solvents, starving, sweating or dosing your stomach with drugs that either ruin the digestion or are so weak they do little more than scratch the surface of the disease," says F. H. Delano, of Syracuse, N. Y. Rheumatism is deep-seated, hard to shake off for good as everyone who suffers from it knows, and it needs medicine which, while harmless to the stomach is strong enough to take right hold to do any permanent good.

Mr. Delano, who suffered from all the torturing, twisting pains of rheumatism for 36 years, found at last, a strong but harmless medicine compound that cured him. As he took it, all those years of accumulated soreness, pain and stiffness just seemed to melt away and vanish. THIS REMEDY IS WORTH TRYING. If you suffer from rheumatism, let Mr. F. H. Delano send you a generous package of his great mecicine FREE. Don't send any money. He wants to give a package free to every one who needs it. Don't suffer another day from rheumatism if this package will end it, but write at once to F. H. Delano, 787B. Syracuse, N. Y., and get your package right away because of the great expense, not more than one free package can be sent to an address.

Tuesday, Sept. 4th

is the day on which classes will be resumed at

Fredericton Business College

Write for information as to our courses of study.

We must have a large number of graduates next year to supply the great demand for office help.

Address :

W. J. OSBORNE, Prin.

FREDERICTON, - - N. B.

Driver Agents Wanted

Drive and demonstrate the Bush Car. Pay for it out of your commissions on sales. My agents are making money. Shipments are prompt.

Bush Cars guaranteed or money back. 1918 models ready. Write at once for my 48-page catalog and all particulars. Address J. H. Bush, Pres. Dept. 12 HT

BUSH MOTOR COMPANY, Bush Temple, Chicago, Illinois

Pain in Shoulders

PAIN IN HEAD

LIVER BOTHERED HER.

Miss A. Windsor, Peterboro, Ont., writes:—"I have been sick for about four years with pains in my head and pains in my shoulders which I always thought were caused by working outside in the sun on the farm.

People told me that it was my liver bothering me, so I bought three vials of Milburn's Laxa-Liver Pills, and found that they were doing me good. I continued taking them until now I am well and strong. I am very thankful to you for my recovery."

Milburn's Laxa-Liver Pills are a specific for all troubles arising from a morbid state of the liver, so keep it active by the use of these easy-acting, non-irritating little pills.

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of somethiug evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that llfe is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 Windsor, Ontario

ows, and the faint tinkle of bell's came in through the winows. The cows were beginning to come home. The spell of Aunt Jane's dramatic art was upon me. I began to feel that my own personality had somehow slipped away from me, and those dead pepole, evoked from their graves by an old woman's histrionism, seemed more real to me than my living, breathing self.

like wfll 5d w:qy- 'Sq li 1?

"There now, I've talked you clean to death," she said, with a happy laugh as I rose to go. "But we've had a real nice time and I'm glad you come."

The sun was almost down as I walked slowly away. When I looked back at the turn of the road, Aunt Jane was standing on the doorstep shading her eyes and peering across the level fields. I knew what it meant. Beyond the fields was a bit of woodland, and in one corner of that you might, if your eyesight was good, discern here and there a glimpse of white. It was the old burying ground of Goshen Church; and I knew by the strained attitude and intent gaze of the watcher in the door that somewhere in the sunlit space between Aunt Jane's doorstep and the little country graveyard, the souls of the living and the dead were keeping a silent tryst.

A TIME-SAVING SEWING HINT

When sewing lony seams use wire paper clips to fasten the edges of the cloth together and no basting will be necessary. Turn up a hem the desired depth and place the fasteners at the bottom edge to hold it in place.

In mabing a buttonhole in serge, the material often frays badly at the out edge. To avoid this make a mark to show the exact size and position of the hole by means of a tacking thread. Then stitch around this tacking thread with the machine. Now you are ready to cut the hole between the stitching and to work the buttonhole over the machine stitching.

When blouses for the boys are bought ready made, it is a good plan to cut off the narrow hem, sew on a narrow belt that just fits around the waist and finish with button and buttonhole. It saves much time in putting in strings.

MEAT LOAF

Butter a long, narrow cake tin and line it with cold mashed potatoes, smoothing it down with a spoon into layers about one-inch thick. Inside this put a filling of roast beef or any other meat, chopped rather coarsely, seasoned with salt and pepper and a few drops of onion juice if desired; moisten with gravy. Smooth this filling till one inch from the top and cover with mashed potatoes. Bake in a hot over for half hour and turn out on a platter. It will look like a crusted loaf and may be cut in neat slices. This makes a delicious supper dish.

HOMEMADE FURNITURE POLISH

An excellent homemade polish especially good for mahoyany furniture is made by mixing three tablespoonfuls of olive oil with one of vinegar. Apply with a piece of flannel, and polish with a dry flannel.

How the Vicious Circle of Neurasthenia is Formed

WHEN the nerves are overstrained by mental exertion, by accident or by shock the irritation makes rest or sleep impossible, and consequently there is no restoration of the wasted nerve force.

In its turn digestion fails, because there is lack of nervous energy to control the flow of gastric juices in the stomach and to operate the other organs of digestion.

Failing to obtain the necessary nourishment, the blood becomes thin and watery, and as a result the nerves are further starved and rendered less capable of standing the strain put upon them.

In this way is formed the vicious circle of neurasthenia or nervous prostration, and there is no magical way in which the circle may be broken up.

Overstrained Nerves, Loss of Sleep, Indigestion

The Food Cure

Mrs. George Ross, Augusta street, Cornwall, Ont., writes: "Some two years ago I was attacked with neurasthenia, or nervous prostration. I doctored with different doctors without any good results, and even took a trip to a distant city to see if I could not recuperate. But upon returning I found I was no better — in fact, I kept getting worse all the time. I had no appetite, could not sleep, and had to be helped up and down stairs. I also had terrible headaches. One day a book was left at the door telling about Dr. Chase's Nerve Food, and I decided to try it. My folks derided the idea, but I went ahead and secured a box, and before finishing that first box I could see that I was getting better. You may be sure I was delighted to find a remedy that would give me relief. I continued taking them, and recovered so thoroughly that I was able to help with the housecleaning that spring. During my nervous collapse I had failed from 115 pounds to 90, and since my recovery have weighed as much as 110 pounds. I still keep Dr. Chase's Nerve Food in the house, and use them when I feel the need of them. I have recommended them to a great many people around Cornwall, as I feel that I cannot speak too highly of them."

The nerve cells are starved and must have nourishment. The blood fails to supply this want, so you must give to the blood in condensed and easily assimilated form the elements from which Nature forms new blood and new nervous energy.

This is exactly what Dr. Chase's Nerve Food does, and it does it so well that no treatment for the nerves has ever met with the enormous success of this great food cure.

You can scarcely take up a newspaper without reading of someone who has been restored to health and vigor and happiness by means of this reconstructive treatment. This is Nature's way of effecting cure, and is, therefore, both certain and lasting. A little patience is required, but once the building-up processs is under way you will find daily evidence that you are regaining health and the joy of living.

Dr. Chase's Nerve Food

50 cents a box, a full treatment of 6 boxes for $2.75, at all dealers, or Edmanson, Bates & Co., Limited, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

MY TASK.

By Florence Jones Hadley.

A homekeeper? Ah, yes, dear heart, and more.
Keeper of hearts for those love gave to me,
Upholding weary hands that else might fail,
Smoothing a little head upon my knee.

A homekeeper am I—this is my task:
To make one little spot all snug and warm,
Where those, so bruised and beaten by the day,
May find a refuge from the night and storm.

Gladly I serve—love makes the serving sweet,
A happy keeper, I, of home and hearts,
Serving, I reign, a queen by love's own right.

PUNCTUALITY

Written by Miss Celia Peck, of Hopewell Hill, N. B. Read at the Fifth Annual Convention, N. B. W. I.

Emerson says, "a beautiful behavior is better than a beautiful form, it gives a higher pleasure than statues or pictures, it is the finest of the fine arts."

Perfection in all things should be the aim of every member of the Women's Institute and the first step towards that goal in Punctuality.

What does Punctuality mean?—The characteristic of keeping the exact time of an appointment or engagement. Punctuality represents a great many things, but I will only mention a few. It represents, "Truthfulness, Faith, Orderliness, Consideration of others," and what are these but the essentials of life?

You will say Truthfulness? Where does Faith come in? Why Orderliness? How "Consideration of others?" Truthfulness—Do you not promise to keep an appointment and we as Canadians must ever be known as a people who keep their word.

Faith—You are expected to be there at such and such a time.

Orderliness—Have you not heard since childhood "Order is Heaven's first law" and whoever said it should have added "And Punctuality is its twin sister," for do they not go hand in hand? Did you ever see an untidy, careless person ever on time anywhere? Always at the last minute there is a scramble for mislaid wraps, etc., with the resultant loss of time.

If to interrupt another while speaking is the height of bad manners, then Punctuality at all gatherings is the very essence of good breeding. Do we not all know the people who invariably arrive at church and other assemblages long after everyone else is seated? Occasionally this may be unavoidable, but when it becomes a habit, it gets past forbearance and a great source of annoyance to those who do not wish to be interrupted, either in speaking or listening.

Punctuality is the keystone in the arch of success. It represents ambition and again you may say "how?" Did you ever see a boy or girl make a success of anything unless they were ambitious, keeping every appointment or engagement promptly and grasping every opportunity for advancement keenly? What sort of a store, bank, factory, etc., would it be if the clerks sauntered in whenever it pleased them?

What is the first requisite of a soldier, of a good servant or official in any capacity, of a railway system? Is it not Punctuality?

Punctuality is the greatest factor in the household. Each day has to be started with it else the multitudinous duties overlap and confusion results. Back of all and first of all is the Mother in the home; the early training is wat counts. We know the lessons taught then, abide with us throughout all our after life.

Think of the wonderful influence we women of the 92 Institutes in New Brunswick can exert just in this matter of Punctuality. The day for slackers in every branch of life is over—let us as women see to it there are no more laggards.

Let us all when we return to our homes (or better still, now,) be resolved never to be late anywhere and impress it upon those over whom we have control the necessity of consideration for others in this respect and so cultivate habits that represent the finest of the fine arts—a beautiful behavior.

WAR TIME PRAYER

Prepared especially for the Women's Institute

Almighty God, our Heavenly Father, who hast permitted us to live in the most wonderful time in the history of all ages, we thank Thee that Thou hast chosen our Nation to play a leading part in the great struggle. Bless, we pray Thee, our brothers and friends, as they fight for the protection of the weak, for the rights of the common people, and for the overthrow of injustice and cruelty. May each one of us in some humble way, be a helper in the great task confronting our Empire and our Dominion. May we allow no petty grievance or trivial annoyance to distract us from the nobler and higher duties of the hour. May we have strength for the daily task. May we have courage to meet and overcome every difficulty. May we keep a cheerful heart and a smiling face through all our troubles. May we not grow weary in well-doing. May we bear one another's burdens and fulfill the law of Christ. We beseech Thee to bless all Christian agencies designed to soften the horrors of war. Hasten the coming of the golden dawn of peace, O Thou blessed Prince of Peace. For Thine own name's sake. Amen.

USES FOR OLD CLOTHES

Under Clothing—Muslin Combination Suits—1. Add new top or bottom part according to need. 2. Cut down for child's suit. 3. Save trimming an buttons and combine with new material.

Stockings—Cotton, (black and white)—1. Dustless dust clothes. 2. Dustless dust mops. (To make: rip stocking up the back and cut in neat oblong. Sew several of these together, hem, and dip in paraffine oil.) 3. Rug rags. 4. Sleeve protectors for garden use.

Silk—1. Make the best clothes for polishing furniture. 2. Can be cut over into children's stockings. They are especially good for half socks.

Nightgowns.—1. Make splendid covers for light dresses which may soil just hanging in colset.

Suits—1. Make into one-piece dress. 2. Combine with new or contrasting material to make presentable suit.

Coats. Rain coats—1. Use for swimming bags. 2. Rain-proof hats.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

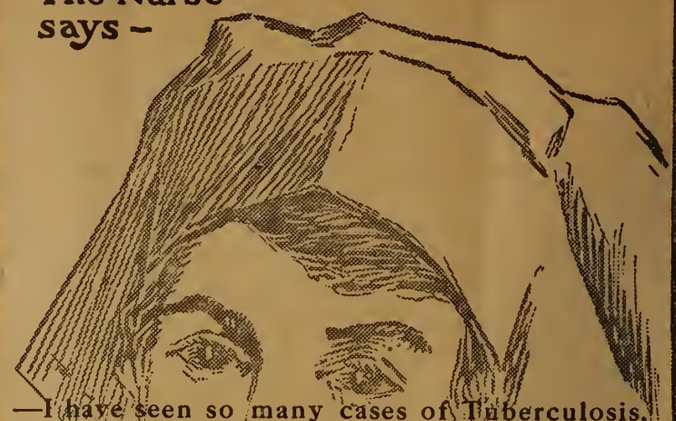
The Nurse says –



—I have seen so many cases of Tuberculosis, extreme nervousness, Anæmia, La Grippe and general debility helped by WILSON'S INVALIDS' PORT that I have come to regard it as indispensable for the proper treatment of all wasting diseases and convalescent cases.

—and not only for these cases, but for persons whose vitality is low or impaired, or who are particularly susceptible to the ills of Winter. Incipient colds, irritating coughs or that "fagged-out" feeling that presages a serious illness, are quickly dispelled by the regular and continued use of WILSON'S INVALIDS' PORT for a short period.

Dr. H W. Brant, the distinguished Physician, says:
"In a number of cases I have prescribed your Wilson's Invalids' Port, and have found it entirely satisfactory in every case where used, being pleasant in taste and sustaining in its action."

H W Brant M.D.

OARK RED BEET A GOOD CANNER

Because of its splendid color the dark red beet is best for canning although those having red and white layers may be canned for home use successfully and, aside from appearance, are as desirable for eating purposes.

All beets will fade somewhat during canning, but if properly done there will be little loss of color and most of this will return in a few days. Older beets will fade more than those which are young and tender. There will be lsss loss of color when the beets are canned whole. Fading has little or no effect upon the quality of the canned beet, but detracts from its appearance.

A much more satisfactory pack may be secured if the beets are graded into three or four sizes. Young, tender beets an inch in diameter, what are known as rosebud beets, are the best, while those between one and two inches in diameter may b canned whole with good results. Larger beets should be sliced or quartered in order to use all the space in the jars.

After the beets are pulled the tops should be cut off leaving about an inch of the stem. Do not remove the tails until the beets are ready to pack in the jars. Wash thoroughly. Soaking in water will not remove all the dirt, as may be ascertained by wiping with a clean, white cloth. Blanch in boiling water for about five minutes or until the skin is loosened. Plunge for a moment into cold water and remove the skins by scraping rather than cutting. Cut off the tails and the balance of the stem, being careful not to cut into the beet itself.

Pack the beets in the jar, add boiling water and a level teaspoonful of salt per quart, put rubbers in position and partially tighten the tops to the jars. Sterilize in a hot-water canner for ninety minutes, in a water-seal canner for seventy-five minutes, in a steam-pressure canner for sixty minutes, or in a pressure cooker for thirty-five minutes. Remove from the canning outfit and tighten covers. Beets should be stored in a dark place to prevent bleaching. When canning in tin, lacquered or enameled cans should be used.

ANIMATION

When a face lacks animation, it lacks beauty, even though every feature be regular and perfect in shape. And a face that has several defects, can still be pretty, if it shows vivaof letters from young girls, asking how they can acquire this desired animation of expression—just as though they wouldn't know themselves, if they only stopped to think about it!

Animation can be forced, even if you do not feel lively and interested at the time. One can always smile—and a smile brings the warm touch of animations to the countenance. And a forced smile is usually the forerunner of a real one. A smile lends sweetness to the face.

If you are animated, yiur eyes are wide and expressive. This alone doubles the beauty of the face. The lips smile, and curve upward at the corners, which gives the most beautiful expression possible to the miuth. The cheeks curve with the smile—smile at yourself in the mirror, and you'll see what I mean—and usually, a bit of color comes into them.

The best way to have an animated expression, I always answer when asked, is to become very much interested in the other person. You may secretly think he or she is very stupid but if you look deep enough, you will find some one thing that will certainly interest you. And such feelings are reciprical. The more you are interested in the other person, the more he or she will be interested in you. Right there is the secret of popularity.

GOOD WAIST AND SKIRT HANGERS.

A frequent annoyance in the summer camp or at old country houses is the row of common rusty nails in the clothes-closets instead of nice, white-painted or bronzed hooks, such as usually furnish the home wardrobes. The resulting rust-spots may be avoided by the use of permanent hangers. They are also convenient for home use, since one does not always care to arrange loops for hanging, especially on thin materials. Best of all, they are always on hand, and never out of order.

For these hangers, cut from the lower edge of worn-out corsets the tape-and-elastic suspenders, of which there are usually two or three sets in good condition. Cut them off so as to leave three or four inches of tape or elastic, and, lifting the slide, insert the cut end till it catches firmly under the teeth at the back, then fold the slide down again, and you have a good, firm loop that can be slipped safely over the roughest nail. Two of these should be provided for each skirt and ine for the back of the waist, or, if preferred, one for each under-arm seam, at the armhole. When the garment is to be hung up, the ever-ready hanger is waiting, and the patent padded clasp obviates all injury to the fabric.

RAISIN FRITTERS

This is an economical dish when somehting extra is needed. Scald two cupfuls of milk with a small piece of stick cinnamon. (Use a double boiler if convenient). Mix together one-half cupful of cornstarch, three tablespoonfuls of flour, and one-half teaspoonful of salt. Add gradually, while stirring constantly, one-fourth of a cupful of cold milk, then add mixture gradually to scalded milk and cook ten minutes, stirring constantly till mixture thickens. Add yolks of two eggs, one-half teaspoonful if vanilla and one-third of a cupful of raisins, (soaked for a few minutes in boiling water, seeded and chopped). Place in a pan, spread evenly and cool. Remove, cut into two inch squares, dip in crumbs, fry in deep fat, and drain on brown paper. Serve hot, with vanilla sauce.

Old Tea Looks All Right

Old tea and fresh tea, poor tea and good tea, all look alike. No wonder a woman often gets a bulk tea she doesn't like.

Red Rose Tea in the sealed package is always fresh, always good, always worth the price on the label.

Kept Good by the Sealed Package

TO CURE FEAR

A little boy who is extremely nervous feared to go into an uniccupied room or upstairs unless accompanied by some older member of the family. It was often convenient to have him do little errands about the house, so his mother procured a large ball of strong twine and suggested that they play a "telephone" game. Giving him the end of the string, she unwound it as he walked away into some other room, and when he was ready to return, rewound it. This proved interesting to the little boy, and he gradually lost his unfounded fear of being alone.

THE BABY'S SLEEP

During the first month of its life a baby needs twenty hours of sleep a day, and thereafter not less than sixteen hours a day up to the end of its first year. It should sleep alone in a crib or basket. A clothes basket with a simple mattress made of excelsior and covered with a heavy balnket makes a good substitute for a crib while the child is small.

The room in which the baby sleeps should be darkened and well ventilated, the windows being liwered from the top. If it cries an refuses to sleep under these condition, then it is time to olok for the cause, for it is pribably sick or overfed or maybe hungry.

All children should take a nap of from one to two hours in the middle of the day until they are six years old.

Croup

"I don't think there is a more anxious time for parents than when their children have croup. Without they are prepared with Chamberlain's Cough Remedy they must wait for the doctor and listen to the choking, metallic cough and watch their little one gasping for breath.

"Granny" Chamberlain

You know the great danger of croup is the formation of a false membrane in the larynx, and until this is expelled relief cannot be obtained, and the spasmodic choking continues. Give Chamberlain's Cough Remedy in frequent doses. It will loosen this membrane and cause the child to expel it by vomiting.

Chamberlain's Cough Remedy

is an absolutely safe and certain remedy for croup, and if given as soon as the child becomes hoarse, or even after the croupy cough appears, it will prevent the attack."

Yours for Health — Granny Chamberlain

29

Equal Honor
Equal Representation
Under Unionist Government

"I have absolute confidence that the pledge of the Prime Minister will be carried out, and that the Union Government will be fifty-fifty. Already the War Council is constituted on a fifty-fifty basis."
Hon. N. W. Rowell, President of the Council.

OUR real political leaders of both parties have joined together for the winning of the war. Since Laurier prefers to cast in his lot with Bourassa, the result is upon his own head. Just as in the trenches Conservative and Liberal fight shoulder to shoulder against the common enemy, so in this election Union Government states its progress and asks your endorsement on the ballot paper.

If you believe Canada should throw her whole weight into the war, and that it will take the very best men she can muster to achieve this

Support Union Government

Union Government being composed of the representative men of both political parties, should be an evidence to the electorate that the present is a crisis in which all past party allegiance should be discarded and all patriots should join in endorsing the Union Government by no uncertain vote, stimulating these men still further to carry out the great work for which the Union was formed, to reinforce our soldiers at the front and prosecute Canada's participation in the war.

Don't Allow Yourself to be Fooled with Arguments About the Sins of the Old Conservative Government which is Dead

The Union Government is a new deal on a fifty-fifty Liberal and Conservative basis.
To talk about the misdeeds of the old Conservative Government is like threshing dead straw.

You can't quarrel with a dead man.

Don't get away from the real issue, which is WHETHER CANADA SHALL FIGHT OR RUN AWAY. Whether it shall follow the miserable and unpatriotic French Canadian lead, or whether it shall be true to British traditions.

UNIONIST PARTY PUBLICITY COMMITTEE

United Empire Loyalists

"Britain Called" and those sturdy Loyalists of the Empire united to give their bloood and treasure for the old Union Jack. When the Empire was in danger they forsook party strife, filled their powder horns and bullet pouches to the bursting point, shouldered their muskets and marched away to the seat of danger. And when the war was over, they gathered together what they could of their possessions, sacrificed the rest, and followed the flag to this Province. You who have sprung from the blood of such a heroic race

Unite Again for the Empire--- Britain Calls Again

You who are descendants of these other Empire Loyalists, will you not hearken to her cry as did your forefathers, will you not forget party and unite to answer the call from the Motherland? Your fighting boys took Courcellette, Vimy Ridge, and Passchendaele with your farewell cheer still ringing in their ears. They are calling to you now to come over and help them. Will you desert these noble lads?

Support Union Government

The Union Government was formed out of the men in the Liberal and Conservative ranks who believed that they should unite to win the war. If you believe that the winning of the war comes first, vote for the Union Government Candidates. If you believe in backing up the lads who are living in filth, bleeding and dying for you, support the Union Government Candidates. Laurier and Bourassa think we have done enough and favor deserting our boys. The Union Government has been created to back up our soldiers and see them through.

"Election means just one thing, you are either going to send men to back up the Canadians or you are not."

Hon. F. B. Carvell.

REPORT OF YARMOUTH AGRICULTURAL SOCIETY

The annual meeting of the Yarmouth County Agricultural Society was held in the Council Chamber on Saturday afternoon, Nov. 17th, E. X. Spinney, Esq., president, in the chair. Minutes of the previous annual meeting read and approved. The secretary's report and financial statement were read and after some discussion were adopted.

To the Officers and Members of the Yarmouth County Agricultural Society:

Gentlemen,—In making my annual report this year I feel that a short review of the past may be profitable to show to what extent we have made progress or whether we have made any.

Sixteen years ago I took over the management of the exhibition. We had then just finished paying off our debt on the building and found ourselves with our grounds surrounded by a rather dilapidated fence. Our stock was all tied to the fence and stakes driven in rows up and down the grounds. Our swine were shown in the carts and racks in which they were brought to the exhibition. Poultry was shown around the northwest fence in boxes or coops as the exhibitor pleased.

The exhibition was then opened at one o'clock and the stock taken from the grounds at 4 o'clock and the general exhibition closed at 9 o'clock in the evening. Now we have three days exhibition. We have closed stalls for about 100 horses and colts. We have comfortable sheds perfectly waterproof for all our stock and a nice little building for our stockmen to sleep and eat in and be near their stock. This stock yard is lighted by electricity.

We have fairly good poultry houses. These houses should be improved and will in a few years have to be rebuild in a more conspicuous place where we can have more light. And what is true of our plant is more especially true of our exhibits. Contrast the fine herds of pure-bred cattle on the grounds this year with 16 years ago. What must the verdict be? Also the splendid booths inside the building this year. We were also honored with a visit from Lieut.-Gov. Grant which no doubt added much to the interest of the exhibition. We think every fairminded person must admit that our exhibitions have been a success.

This year was no exception. After the exceptional off-year of 1917 from almost every standpoint, a late spring, cold and wet summer followed by an August gale unprecedented for half a century, and a number of very severe early frosts, we think our exhibition surprised the public and showed that we have some very successful farmers if they have a fair chance.

These things should encourage us to continue our efforts to educate especially our young men along agricultural lines and not to stop to listen to the croker that sees nothing but failure anywhere.

Special mention should be made of the Dominion exhibit in charge of Mr. Bligh. This no doubt was the best exhibit ever placed in our exhibition. An afternoon could have been well spent in studying this exhibit.

Also the exhibit sent by Prof. Saunders (Entomologist) from Annapolis. Some of these facts were startling, especially the difference given between sprayed potatoes and those not sprayed. There no doubt has been money nough lost this year in Yarmouth County to pay for several spraying outfits. Some organized effort should be made this winter so this great loss can be remedied before another summer.

Much could be said about the general exhibits suffice to say they were in many departments superior to previous years. The school exhibit was very much above the average and so well arranged that it was very attractive. There were some very fine booths; perhaps special mention may be made of the new ones constructed this year by R. H. Davis & Co. These make the building very attractive.

The financial statement shows a balance on the right side. Our sale of entry tickets were somewhat in advance of last year but our sale of space was less and our prizes awarded were larger which makes our balance about the same.

In conclusion we wish to thank all who assisted in making the exhibition a success. Especially the railways for their reasonable rates on their respective lines and for their special trains Wednesday and Thursday, which were so well patronized this year.

Respectfully submitte,
WM. CORNING, Sec'y.

The circular letter was received and read and ordered placed on fyle. A letter was read from Prof. Trueman of Truro, re brood sows and the secretary was ordered to reply asking for further information and suggesting he advertise in local papers. A letter was also read from the Maritime Farmer, re the co-operation system of buying feeds, etc. This was laid on the table. The following officers were appointed for the coming year:

President—E. K. Spinney, Esq.
Vice-Pres.—S. A. Cook.
Sec'y.-Treas.—Wm. Corning.
Directors—J. L. Lovitt, J. M. Porter, J. F. Palmer, John C. Corning, Walter Churchill.
Auditors—W. A. Godfrey, M. C. Wyman.

Resolved, the society hold an exhibition three days in 1918, dates to be fixed by the management.

After some discussion on the spraying of potatoes it was decided to appoint a committee to cooperate with the Farmers' Association in considering some organization in which some more effective work may be done. The committee appointed were Wallace Cook, John C. Corning, Walter Churchill. Dr. Webster made some remarks about the raising of heavy horses in the county, and was followed by several members, but no conclusions were carried out. Meeting adjourned after a pleasant session.—Yarmouth Light.

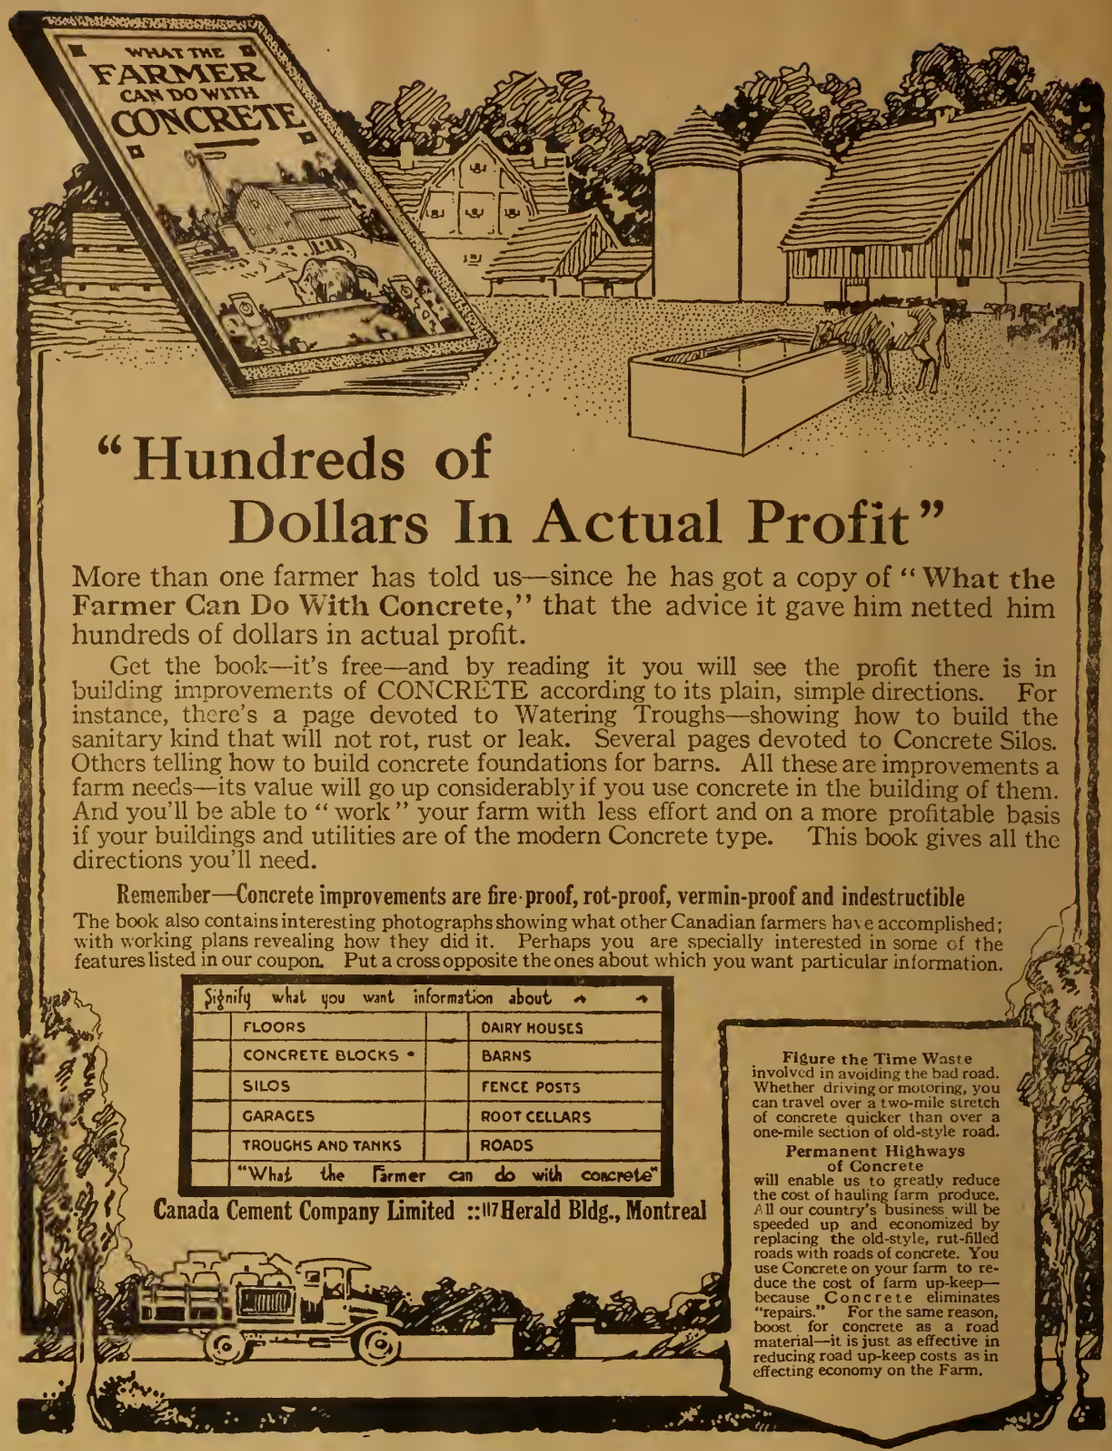
AN IMMINENT WAR TIME CONDITION

(Continued from page 133)

seed grain are urgently requested not to grind the grain, but reserve it for seed purposes and notify the Department immediately re the varieties and quantities they have for sale.

The foregoing paragraphs indicate the seriousness of the situation. It is a situation that demands concert-d action on the part of every farmer in the three provinces. The plan of campaign therein outlined is one that is workable, and one that has the approval of men who have given the situation their most careful attention. The farmers of the province and others who may read these paragraphs, are urgently requested to give the matter all the publicity they can. Our soldiers must have bread, and when the supply runs low they must have the first consideration, or calamity will surely fall upon us, and upon generations that are to follow.

Help to avoid a wide world calamity. Do not leave it to the other fellow. Do your part and having done so, strive to induce others to follow your example before sheer necessity, self preservation and the pangs of famine compel more drastic measures, and our children cry for bread when there is no bread.



"Hundreds of Dollars In Actual Profit"

More than one farmer has told us—since he has got a copy of "What the Farmer Can Do With Concrete," that the advice it gave him netted him hundreds of dollars in actual profit.

Get the book—it's free—and by reading it you will see the profit there is in building improvements of CONCRETE according to its plain, simple directions. For instance, there's a page devoted to Watering Troughs—showing how to build the sanitary kind that will not rot, rust or leak. Several pages devoted to Concrete Silos. Others telling how to build concrete foundations for barns. All these are improvements a farm needs—its value will go up considerably if you use concrete in the building of them. And you'll be able to "work" your farm with less effort and on a more profitable basis if your buildings and utilities are of the modern Concrete type. This book gives all the directions you'll need.

Remember—Concrete improvements are fire-proof, rot-proof, vermin-proof and indestructible

The book also contains interesting photographs showing what other Canadian farmers have accomplished; with working plans revealing how they did it. Perhaps you are specially interested in some of the features listed in our coupon. Put a cross opposite the ones about which you want particular information.

	"What the Farmer can do with concrete"		

Canada Cement Company Limited ::117 Herald Bldg., Montreal

Figure the Time Waste involved in avoiding the bad road. Whether driving or motoring, you can travel over a two-mile stretch of concrete quicker than over a one-mile section of old-style road.

Permanent Highways of Concrete will enable us to greatly reduce the cost of hauling farm produce. All our country's business will be speeded up and economized by replacing the old-style, rut-filled roads with roads of concrete. You use Concrete on your farm to reduce the cost of farm up-keep—because Concrete eliminates "repairs." For the same reason, boost for concrete as a road material—it is just as effective in reducing road up-keep costs as in effecting economy on the Farm.

Management of Soil Fertility

Henry G. Bell, B. S. A., Chicago, Ill.

The Home of the Plant

The average farmer calls his soils sand, clay, loam or muck. These classes differ in a great many ways. They differ in color, chemical composition, weight, size of soil particles, etc. The difference in size of soil particles is the point of special interest to us at this time.

I hold a small bottle containing about an inch of colored water, and have here three glass tubes—one of fine bore, another a little larger bore, and naother still coarser. When I set the tubes in the water you see that the liquid rises of its own accord to different heights in the two fine tubes. What draws it up? It is the attraction on the part of the walls of the tubes for the water. The liquid rises until the down-pull of gravity just balances the up-pull of the force that is raising the water. This force is responsible for the rise of moisture in the soil. There are spaces between the soil particles reaching from the surface of the soils down to where moisture stands. Water rises in the soil on account of the attraction between the surface of the soil particles and the moisture. The water rises through the spaces between the soil particles, just as the water rose in the bore of the fine tubes.

I speak of water first because it has such an important bearing on plantfood. Plants must have all of their plantfood dissolved in water. You see an actual illustration of the rise of soil moisture. These columns of soil rest in a pan of water. In two hours the water has risen to the heights you see. In just tht same way it is rising in the oil and will continue to rise until it comes to the surface when the water will evaporate and do no good to the crop, if nothing is done to prevent its escape. This can be prevented by early cultivation of the soil, spring ploughing, disking, harrowing, anything to break up the surface of the soil and to preserve a dust mulch, so that the moisture cannot escape in evaporation.

In this last tube is illustrated a practice against which I would warn farmers who are turning a heavy crop of clover, or are making a heavy application of strawy manure. You notice that the water has risen in this tube until it meets the coarse material about eight inches from the top. This couple of inches of coarse material corresponds to strawy manure or to a heavy crop of organic matter turned under, and not thoroughly worked into the soil. The water cannot reach the soil above because the spaces of the coarse material are too large. When applying strawy manure or turning under green crops, be sure to work the organic matter thoroughly into the soil by disking and harrowing, otherwise there is danger of cutting off the water supply for the crops planted in just the same way that the coarse material in the tube prevented the water rising higher. I remember a few years ago, a frind of mine near Chicago said he planned to grow a very large crop of potatoes. He turned down a good growth of rye but did not work it thoroughly into the soil. The green rye which was not thoroughly worked into the soil formed a coarse padding and actually cut off the moisture supply from the area where the potatoes were planted. My friend's potatoes did not sprout and grow as rapidly as they should. He actually starved the crop by shutting off the water supply.

Moisture is of great importance. Sometimes we do not fully realize how important it is in growing our ordinary farm crops. One pound of dry matter in corn, for instance, requires 400 pounds of water to germinate the corn and carry it through to the production of matured grain at harvest time. For each pound of dry matter in oats, wheat and potatoes, there is required the amount of water tabulated on the chart. This is a tremendous amount of water when we consider the average yields harvested. Much can be done to store up this large amount of water by deep fall ploughing. The deeply stirred soil forms a good reservoir to catch the moisture. By early spring working it is possible to prevent excessive loss by evaporation.

Up to this point, I have been talking of conserving the moisture of the soil. May I point out that there may be too much moisture? A good many farms in Canada are in need of better soil drainage. Moisture which stands in the spaces between the soil kernels or particles, shuts out the circulation of air, and air is essential to the growth of the great mass of microscopic life known as bacteria which, under good conditions, thrive in the soil. These tiny forms of life are breaking down the soil so that it may dissolve and become available as plantfood. They are working incessantly. Some of the tiny forms are attached to the roots of legumes—such plants as peas, beans, alfalfa and common red clover. These tiny forms of life are parasitic. They take their food from the plant, but in return have power to fix some of the nitrogen (an important constituent of plant food), which is found in the air that circulates in well-drained soils. Whether the bacterial forms are attached to plants, or exist free in decaying plant matter in the soil, they require well-drained soil. In many sections of this good province, the farmers are in the lead with reference to land drainage. Still much remains to be done in taking care of this prime essential to the right home of the plant. Such water as can be drained off, then, is actually doing injury to the soil instead of good. The water which clings to the tiny soil particles cannot be drained off. It is this water which carries dissolved food for the crops that grow upon your land.

One of the methods of storing up more water in the soil is to add organic matter to the soil, decaying plant material. Organic matter, or humus, acts like a sponge, catching and holding the moisture which falls late in autumn, during the winter and early in spring. It is increased in the soil by the growing of legumes, by the addition of strawy manure, by the turning under of rye or buckwheat or other plant material.

I wish to illustrate another function of organic matter. If I were to take a funnel full of sand, and a second funnel full of muck. When I pour a red liquid on the sand it comes through red, but when I pour it on the muck soil it comes through almost colorless. The organic matter has absorbed the color. If the organic matter of soil has the power to absorb color, it has the power to catch and hold much soluble plantfood which otherwise would be lost out of the soil. Here, to a large extent, is the explanation of the fact, reported by Dr. Zavitz, where the effect of fertilizers, used upon potatoes, was quite evident for two or three years in the crops of barley and oats, which followed the potatoes. What the potatoes did not use was carried over for the barley. What the barley did not use was carried over for the oats. Of course the organic matter has not the power to hold all the soluble plantfood, but this important function of humus in the soil is sufficient to induce greater attention toward increasing the organic matter of the soil.

Organic matter performs other important duties. Applied to sandy soils, it binds together the loose particles, giving them body. Worked into heavy clay soils, organic matter opens up the soils and greatly improves the circulation of air therein.

Let us demonstrate that air does circulate in the soil. Let us show also how a man may injure the circulation of air in the soil, especially if the soil is of a heavy clay type and is worked too early in the spring or too soon after a heavy rainfall. In this first funnel, again, I have a layer of sand, and in the second funnel, some wet clay. You who farm clay soils, have undoubtedly seen the shiny furrows the plow turns up when the clay is a little wet or sticky. Or, you have seen the shiny furrows turned up by the shoes of the cultivator, in cultivating your corn soon after a heavy rain. This clay, then, is in the same condition as the soil which the plough turns up in shiny furrows. When I attach the first funnel to this long bottle, and open the stop-cock at the bottom, if the air can pass through the sand the liquid will run out of the bottle and the column will fall. This, you see, is the case. When I attach the wet clay and open the stop-cock, you see that the water does not run and the column of water in the long bottle does not fall, because the air circulation is shut off. Now, to a large extent, that is what happens in your clay soils when the soils are worked while they are too wet. Of course, I do not wish to say that you shut off the air circulation, but even if any considerable hindrance to air circulation is produced, conditions for bacterial growth in the soil are upset.

We have said that organic matter in the soil (first) has the power to catch and hold water; (second) has the power to absorb plantfood; (third) opens up heavy clay soils; and (fourth) binds together sandy soils. To these duties may be added two more very important functions. They are as follows: Organic matter forms the home and food of free soil bacteria. Now you see the vast importance of good circulation of air in the soil. The bacteria that grow on the roots of the legumes, as well as those that are free in the soil, find it impossible to do best work unless there is a sufficient supply of organic matter in the soil. The soil must be well drained so that air can circulate among its particles.

There is another condition which proves njurious to this microscopic plant life or bacteria in the soil. It is commonly known as soil sourness. I hold a piece of litmus paper. You see it is of purplish color. As soon as it comes in contact with anything of an acid nature, it turns immediately to a bright pink. This is the cue for the soil test. Dig a shallow hole about four to six inches deep in various parts of a field and bury a small piece of this litmus paper for about fifteen or twenty minutes. When you dig it up again, if it has turned pink, there is clear indication that the soil is sour, and is in need of lime.

It is frequently possible to recognize acid soils without testing them. Vegetation that grows on sour soils is usually clear evidence of their condition. If, for instance, you find that there is a scarcity of clover in your soil, and you see moss growing on the surface of the clay and sheep sorrel scattered through the grass or other crops, you can be pretty sure that your soil is sour. Lime is the great corrector for sourness of soil. Lime is found in several forms. It may be purchased in the form of ground limestone, air-slaked burnt lime, hydrated lime, or in the form of marl. Dr. Wheeler, formerly director of Rhode Island Experimental Station, has estimated that one ton of quick lime was equal to one and one-third tons of hydrated lime, or two tons of raw limestone in its power to correct soil acidity. The addition of air-slaked burnt lime to clay soils produces an additional effect. In these two jars I have shaken up clay soil and water. You see in the one, the water is still muddy. In the other, it is clear. I added a couple of spoonfuls of air-slaked burnt lime when shaking up

the latter mixture. If you could examine the surface of the clay at the bottom of the clear jar, you would find that it is coarser than is that in the other jar. In other words, air-slaked burnt lime has the power not only to correct soil acidity, but when applied to heavy clay soil, it gathers together the particles of clay soil into coarser crumbs, and thereby assists the circulation of air in the soil.

The Food of the Plant

So far we have been speaking about the home of the plant. Now I wish to spend a short time discussing the food of the plant. I presume you have not seen this type of corn growing in Ontario. I am not advertising it. It is but a cartoon of a growing corn plant. It is typical of how all plants grow. The lesson it is intended to convey is that the roots act in the same capacity as railroad trunk lines, bringing raw material from the soil to nature's factories, which are the leaves of the plants. This is not vain theory; it is fact. If the farmer recognizes it in its full significance, it will greatly assist him in making conditions right for plant growth. The leaves of the plant are equipped with the most wonderful machinery, just as factories are equipped with machinery. The green material in the leaves is nature's machinery. Under the action of sunlight it has the power of working over the raw material which is brought up by the roots and of re-combining it with carbon dioxide, which is taken in through the leaves, into starch, protein, fiber and other constituents.

Plantfood is made up of fourteen elements. I have recorded here twelve constituents which come from the soil. Arranged in order they are: water, sulphur, magnesium, iron, lime, nitrogen, phosphoric acid and potash. These are known as the necessary constituents and are so-called because all of them must be present in the food of the plant in order for the plant to thrive. Not one can be left out and have complete plant growth from seed germination to the bearing of fruit. To these eight constituents are added chlorine, silicon, manganese and sodium, but we need not discuss these, since frequent experiment has established the fact that they perform no essential function in the growth of the plant. There should, of course, be added to this list, carbon dioxide, which would fall in the first class, but as you see the chart tabulates only those which are taken from the soil. Carbon dioxide is taken in through the leaves. With many of these constituents you are very familiar, and yet from the very familiarity with some of them, if you have not had opportunity to study chemistry, you may have missed some very interesting facts. Water, for instance, while it is a constituent of plantfood, is not an element, but is composed of two things; first, hydrogen gae which I have in this bottle. You see it is colorless, and yet when I hold a lighted match near it, it burns very rapidly with a sort of purplish flame. Besides hydrogen, water contains oxygen, which again is a colorless gas, such as I have in this jar. Oxygen does not burn. When I lower the glowing stick into it, the stick immediately bursts into flame. Now, if two bottles of hydrogen and one of oxygen were exploded with an electric spark, there would be formed a tiny drop of water. You say, "how does this information help the practical farmer to increase his crop yield?" I cannot claim such a practical result from this experiment, but the knowledge of the composition of water itself and how growing plants can re-combine the constituents of water with other things which it takes up through its roots, opens up an entirely new world of ideas to the farmer who has been working with crops and soils all his life.

Sulphur is the next constituent. You are familiar with this interesting yellow substance. In plant life it seems to be closely related to the building up of proteins, or the material which produces flesh. Magnesium is an important constituent of the soil whose duty is not fully established as yet. It seems to have an important function in the plumping of the gernels of wheat, oats and other cereals. Lime, we have said, corrects the sourness of soil. The next constituent is iron. Few people know that the plant, during growth, requires the tiniest trace of iron. Without iron the green material of the plant would fade, and the plant would become bleached. Now do not jump to the conclusion that every pale crop of corn, wheat or oats that you see is in need of iron, because this is not the case. Bad drainage causes crops to turn yellow, as do other bad soil conditions, but the fact remains that the tiniest trace of iron is absolutely necessary to the growth of the plant. The soil nearly always contains sufficient of this substance to upply normal needs. Each one of these constituents is essential, as discussed heretofore, but nature has so arranged the upply that little care is necessary to keep up the required amount, with the exception of lime.

Now we come to these constituents which are frequently called the essential plantfood constituents. They are no more essential than those we have discussed. However, the ease with which they are depleted by continuous cropping has made it possible in many sections for their supply to be reduced below what is necesary to grow the largest yields of best quality crops. The first of these constituents—nitrogen—I have in this jar. You see again, it is a colorless gas. It neither burns nor will it support ubrning. The air which we breathe is eighty per cent. nitrogen. We could not live in a pure atmosphere of nitrogen, but in the dilution with about twenty per cent. oxygen, we seem to thrive.

Here let me make an explanation that none of the constituents discussed are used by the plant in their pure forms, but are found in combination with other materials in the soil. Nitrogen is not used by the growing plant as a gas ,but is used with oxygen and some other material which forms a nitrate of salt in the soil, or it is combined in some soluble form. Nitrogen causes straw growth. It vines the apple tree to grow. Stating it conversely, if there is a scarcity of nitrogen in the soil, the result is shown in short straw, poor tree growth, small growth of potato vines, and the like. If, on the other hand, there is too much nitrogen, there will be too great a straw growth, too much wood growth in trees, and too much growth of vine or stalk of the plant. You have frequently seen this when you plant small grain on muck soil.

The next constituent is phosphoric acid. In its pure elemental form it is called phosphorus—the yellow substance which you see burning so readily. The plant never uses pure phosphorus. Phosphoric acid in plant growth causes the plant to ripen. Crops growing on a soil short of phosphoric acid do not ripen within the normal growing season. This is just the trouble that we are having throughout the great corn belt in the middle western states. Much of the corn is not maturing before frost because continuous growing of grain crops has greatly diminished the supply of available phosphoric acid in the soil.

The third essential constituent is potash. It is one of great importance at the present time on account of its increasing scarcity al over the cicilized world. As you know, previous to the opening of the great war, neary all of the world's supply of potash came from Germany. Here it is found as a ptoash salt. Potassium is very active. A tiny particle burns very actively when I drop it on water. As already explained, this constituent, as well as others, is never used in its elemental form, but is combined with chlorine or sulphuric acid or some other material in forms which dissolve in water and can be readily taken up by the plant. What is the function of potash? This is not clearyl known as yet. Potash seems to have an important bearing on the plant's power to use nitrogen. Potash also has a great deal to do with the laying down of starch within the kernel of wheat, oats, or barley. It ahs also been found that plants growing on a soil deficient in potash do not successfully resist disease.

What are the chances of making good on this continent the large amount of potash that formerly was imported from Europe? There are no deposits of potash salts in America as pure as those found in Europe. Potash is found, however, combined with a sort of granite-like rock in Utah. It is also found in the sea-weeds of the Pacific and the Atlantic oceans. Moreover, lake water strong in potash has been found in small lakes in Nebraska and California. All of these sources are being developed at the present time, but the total amount of potash does not aggragate one-fifth of the normal demands.

All of the foregoing plant food constituents are found in virgin soils, yet continuous cropping has been drawing upon the soil store-house to such an extent that one or more of the constituents is becoming dangerously near depletion. The late Henry Wallace, of Des Moines, used to say that the farmers of the middle and western states were soil miners, not soil builders They have been growing crops so persistently without attention to the upkeep of soil fertility that both the yield and the quality has suffered. Some have sought a solution in rotating their crops. But there comes a time when the soil will not respond even to the best tillage and the best rotation unless some plantfood is put back. When the rotation of crops contains a legume, some of the nitrogen is put back, if the second crop of clover is ploughed under. If the second crop of clover is cut and taken from the land, very little addition of nitrogen is contributed as a result of the growing of the legume crop. For some years past I have been conducting an investigation relative to the amount of nitrogen fixed by the various legumes growing on the farm. In this investigation I have corresponded with all of the leading experiment stations on this continent, as well as with some in Europe. The consensus of opinion seems to be, as I have stated, that if the second crop of clover is ploughed under, there is an addition of nitrogen to the soil, varying inversely with the richness of the soil. On many farms buckwheat and rye and other crops are turned under as green crops. These do not make any addition of plantfood. They do add organic matter.

For more than one hunred years the farmers of this continent have been hearing about the value of barnyard manure as a carrier of plantfood, and still you can go up or down any road and find farmers who are piling the manure under the eaves of the barn where every rain washes through it and carries off soluble plantfood in the brown stream that runs away from the manure pile. Now this brown stream carries off more than fifty per cent. of the soluble nitrogen and potash, as well as a considerable amount of the soluble phosphoric acid of the manure. Average analyses show that well-stored manure carries, to the ton, twelve pounds of nitrogen, five pounds of phosphoric acid and ten pounds of potash, but if this manure is exposed to rains and snows, over half of these constituents of plantfood is lost. For the last twenty years, Director Thorne, of Ohio Agricultural Experiment Station , has been making a study of strengthening stock manure. Dr. Zavitz knows the high type of work being conducted by Dir. Thorne, and I am sure agrees with me that the findings of this well-known investigator are entirely practical, and important to the progressive farmer. Dir. Thorne, as a result of twenty years' careful study, recommends the addition of forty to fifty pounds of acid phosphate to the ton of manure, so that the plant-ripening plantfood carried by the manure may be balanced in proportion to its nitrogen and potash. This material can either be spread on top of the load of manure or it can be distributed on the surface of the land with a lime spreader, and worked into the soil when the seed bed is being worked down.

The next source of nitrogen, phosphoric acid and potash is fertilizers. While travelling up and down this continent, from the Mississippi to the Atlantic, and from Tennessee to Ontario, I find a great variation in opinion relative to what fertilizers are and what service they render. The use of fertilizers is a practice of comparatively recent date in some sections of the country, yet in others—especially in Europe—fertilizers have been used for the last one hundred years. We are hearing more about the use of fertilizers during the last year or two, because as I said at the beginning, the cry is for more food, and more food results from greater yields, and greater yields are obtained by propr soil handling, including the judicious use of fertilizers. The manufacture of fertilizers is an industry based upon definite scientific principles. As understanding of the proper use of fertilizers, while it may appear simple, is still based upon somewhat difficult physiological facts. This being the case, it is quite natural that ignorance marked the early use of this soil amendment. The beneficial use of fertilizers was discovered by an English manufacturer whose hobby was farming. This man, Sir John Bennett Lawes, was also founder of the Rothamsted Experiment Station. In fact, his test of fertilizers formed the basis of the Rothamsted Experiment Station tests. Lawes was a pioneer in his work with prepared plant foods. He succeeded in instituting tests from which he was able to determine the effects of applying various plantfoods upon various farm crops.

The various important functions that fertilizers perform are: First, they supply soluble available plantfood to the crops; second, they give the crops an early vigorous start; third, they hasten crop ripening; and fourth, if used judiciously, they increase the farmer's profit.

How is a man to know what fertilizer he should add to his soil, in order to produce the largest yields of best quality crops. This is a question which is being asked every day. Shall he have the soil analyzed? When I was in charge of the soils work at the University of Maine, I used to receive many letters accompanied by small samples of soil. They requested me to analyze the soil and to tell what fertilizers to apply in order to produce one hundred bushels of corn to the acre. The chemical analysis of the soil, of course, is a comparatively simple matter, and as far as the sample under examination goes, the analysis shows the total amount of nitrogen, phosphoric acid and potash in the soil. But the soil analysis, while to a man trained in chemistry, it is a guide, has limitations when applied to working out this question of the management of soil fertility. I know that Prof. Harcourt agrees with me when I say that a chemist can tell you what is in your soil, but cannot with assurance recommend exactly how much or what plantfood should be added. A chemical analysis does not tell you anything about the physical conditions of your soil. Dr. A. D. Hall, former director of Rothamsted station, said before the British Association in London, 1910, that he considered the size of soil particles of more importance than their actual chemical cmposition. He meant that the physical condition of the soil has more to do with its productivity than the potential amount of plantfood contained

therein. Now, chemical analysis has a place, and that place is splendidly illustrated by the soil survey work that Prof. Harcourt is conducting throughout the Province at the present time. Representatives of the college staff are visiting various parts of the Province, taking exact samples of soil, classifying the soil on the basis of its total plantfood, and are mapping out areas of similar soil types so that the practices in one section which are found to give good results may be with certainty recommended for other sections.

We know that soils have various supplies of plantfood. The characteristic supplies of plantfood in the common soil types are as follows:—

Soils	Nitrogen	Phosphoric Acid	Potash
In sandy soil	Poor	Poor	Poor.
In clay soil	Medium	Medium, but frequently unavailable.	Medium, but frequently unavailable.
In muck soil	Abundant. This nitrogen is very largely in the organic or slowly available state.	Poor	Very poor.

To this information must be added a knowledge of the characteristic plantfood needs of the crops. For instance, ordinary farm crops may be divided roughly into three classes, namely, hay crops, grain crops and root crops. The hay crop is cut when it has made its maximum growth. It, therefore, takes a large supply of nitrogen, a medium supply of phosphoric acid and a fair supply of potash. Grain crops, on the other hand, are harvested when the grain is ripe. Consequently, they take an abundance of phosphoric acid, and a fair supply of the other two constituents. Root crops take a good supply of nitrogen, but a large supply of potash, since they develop a relatively large per cent. of starch. Now, if the farmer has in mind the information contained in the first part of the chart, and that contained in the second part, he can intelligently establish tests both as to the quantity and quality of the fertilizers that give best results under his farm conditions.

The next question of great importance deals with the application of fertilizers. How are fertilizers best applied to our various crops? Two years ago I tried to interest the American Society of Agricultural Engineers at our various agricultural colleges in a series of tests as to how fertilizers were best applied. I regret to say that no great fund of information has resulted from this recommendation as yet. It is still an open question as to how deep fertilizers should be drilled, as to how close to the crops they should be applied and as to what quantity should be put in the row or distributed between the rows for cultivated crops, such as potatoes, corn and the like. We have made careful observation, as we have visited the farms of successful users of fertilizers, and have come to some fairly definite ideas regarding the right and wrong way of applying fertilizers. Not long ago it was my opportunity to visit an experimental field at one of the prominent middle western experiment stations. I found that in their tests they were applying the fertilizer broadcast on top of the sod and ploughing it under, probably to a depth of five to seven inches. Fertilizer users in the middle west consider an application of three hundred pounds per acre relatively heavy, and yet if you figure how much that would be per cubic foot, you will find that you could hold it in a very small bottle. Just think of fertilizers being applied at that rate per acre and buried six or eight inches deep. What possible results could a young crop have of gaining assistance when available plantfood is placed so far away from it? Other fertilizer users are scattering the fertilizer on top of poorly prepared seed beds and are not working it into the soil. Now we said sometime ago that fertilizers were carriers of available plantfood. We also said that the plant could use only such food as is dissolved in the water of the soil. If this available plantfood of fertilizers is to be dissolved in the water of the soil, it must be worked down into the damp soil. Fertilizers give their best results when drilled about the depth at which the grain is planted. This application is accomplished best through the fertilizer dropper of the grain drill. This machinery sows the fertilizer into the damp soil at about the proper depth. If, however, you do not have a grain drill with a fertilizer dropper, satisfactory applications can be made by sowing it on top of the ploughed land with the lime spreader. When the land is being disked and harrowed in the preparation of the seed bed, the plantfood will be worked into the soil at about the proper depth.

Remember that the same principle underlies the successful use of fertilizers as applies to the use of valuable farm machinery. If the machine is adapted to the crop on which it is being used, and if it is properly handled, all chances are in favor of the investment in the machine returning a profitable interest. If fertilizers are adapted in analysis to make up for the weakness of the soil, and to meet the special needs of the crop, and if they are properly applied, a paying interest on investment follows.

I have already referred to the grain drill with fertilizer dropping attachment, and to the lime spreader. To these should be added the special machinery designed for the planting of potatoes, corn and other crops. Any and all of these have been carefully constructed to take care of the dropping of the seed and of the application of fertilizers.

In the presentation of these facts concerning soil fertility and plantfood management, I have tried to develop the subject logically, emphasizing the fact that the point of first importance is the proper preparation of the plant home. When this has been taken care of, the question of the proper balance and supply of plantfood becomes of prime importance. Fertilizers will not take the place of a well-prepared seed bed, good drainage, or cultivation of crops, but if used intelligently in combination with proper soil tillage, lining where necessary, and the up-keep of organic matter, and in combination with the use of high-grade seed, fertilizers will return a big profit on investment.

The business of farming is not simple. It is complex. My conception of it may be illustrated by an arch. On the one hand, this arch rests on the corner stone of soil fertility, while on the other is rests on the corner stone of marketing. It is useless to talk of producing larger, better crops if the subject of marketing is not given equal care. This remark, of course, applies to normal trade conditions. The keystone is business management. The other stones are: efficient help, suitable live stock, favorable weather conditions, seed selection, efficient machinery, proper drainage, good tillage, judicious liming, and proper manuring and fertilizing. All controllable factors must receive attention if best results are to be obtained.

WHY BACON IS DEMANDED

Many reasons combine to make bacon an exceedingly important meat item in the war time trade from this continent to Great Britain and the armies at the front. It should first of all be understood that, in the trade, "bacon" means more than is usually referred to as "bacon" by the general public. "Bacon," as a trade term, includes the entire hog when dressed and split into sides, either "green" or "cured." The Wiltshire side averages from 50 to 75 pounds, of which only 7 per cent is bone. This means a great economy in space when packed for shipment, for Wiltshire bacon is practically solid meat, and can be packed flat in cases of convenient size and shape, 14 to 16 in a case without loss of space.

The superiority of bacon in this respect is shown by comparison of the average percentage of bone in the different dressed carcasses as reported by a leading abattoir:

Wiltshire side bacon. 7 per cent bone.
Dressed beef.....20 per cent bone.
Mutton.....20 per cent bone.
Veal.....25 per cent bone.

As a result of the present shortage of available ocean tonnage, this point is of no small consideration. Moreover, bacon is very high in food value. The following table shows the relative food values of the principal meats entering into domestic consumption expressed in "calories," the units of heat and energy fixed by dietitians in considering the use of different foods to the human body:

	Calories.
Bacon (cured and smoked)	2,930
Mutton (including tallow	1,520
Side of beef	1,180
Lean beef	670
Veal	640

Theese figures show that more vital heat and energy are concentrated in a pound of bacon than in a pound of beef, veal or mutton. The fat constituent of bacon is of particular advantage to men working and fighting in the open air, especially in a cold, wet climate. And the shortage of fats in Europe is acute.

Another advantage of bacon and other hog products in the present circumstances of this war is that there is less "shrinkage" in the handling of hogs. The difference between a live hog and a hog killed and dressed is only 25 per cent. The different domestic food animals compare in that respect as follows:

	Live Weight. Lb.	Dressed. Lb.	Shrinkage. Per cent.
Hog	170	127½	25
Steer	1,100	550	50
Calf	150	75	50
Sheep	150	75	50
Lamb	100	50	50

In the case of bacon and hog products there is less waste than in the case of other meats.

Veal, lamb and mutton are not authorized in the army rations. These meats have to be shipped fresh or frozen. Bacon, once cured, runs little or no danger from spoiling and can be handled with less care and expense. The curing process consiss of an immersion in salt and water at a temperature of 40 degrees for 15 to 20 days. In England the cured Wiltshire is smoked, cut up into shoulders, sides, hams, etc., repacked in smaller boxes and sent to the front. Every part of the Wiltshire side, including the ham, thus reaches the soldiers.

Another point emphasized by the Food Controller just now is that pigs can be produced more rapidly than beef cattle, sows being capable of caring for two litters of young pigs per year, the young sows being sufficiently mature for breeding purposes at one year old.

Beef is second only to bacon in food value, percentage of shrinkage, percentage of bone, and economy of handling. This explains why beef and bacon are the meats especially required for export, and why the people of Canada are asked to conserve them.

WHY WHEAT IS NEEDED

There appears to be some misunderstanding as to why wheat especially should be saved ofr export and why other cereals will not meet equally well the requirements of the Allied nations in Europe. It is important that the people of Canada should know the reasons for the Food Controller's regulations and appeals, and it is earnestly hoped that people will give as wide circulation as possible to the following facts:

Three grains—wheat, rye and barley—are peculiarly suited to making bread. They contain certain elements which can be kneaded when mixed with water. When yeast is added, they raise and maintain a continuity of structure. When the latter is baked it forms a loaf which will keep and can be transported. None but these three grains will make bread as it is commonly known. In a recent address on the wheat needs of the world, Dr. Alonzo Taylor said:

"As one follows each natoin's development upward in an economic sense, one notes that they first eat barley. As it becomes more prosperous, barley is thrown to one side and rye is used; and finally rye is cast aside and it subsists upon wheat. This has been the history of most Aryan peoples. The United Kingdom depends almost entirely upon wheat for its bread. Italy consumes wheat bread, but bread is not so prominent as elsewhere. Rye is universally used in Russia, and barley is still employed as a bread grain. The reason why wheat supercedes rye and barley is because the bread is whiter, of a finer texture, and has unquestionably a better taste. The flour has somewhat better keeping qualities, and wheat flour lends itself to the making of pastries and fancy articles as no other flour does."

There are at least two strong reasons why the Allies cannot use other cereals entirely to make up their deficiency in wheat:

1. People who are working under unusual stress are not in a situation to tolerate any marked deviation from the normal diet.

2. European trade conditions make such substitution extremely difficult. In North America the bread used by more than half of the population is baked in the household and less than 50 per cent is purchased from the baker. If the Allies are not supplied with enough bread grains to make a loaf, then people must be taught an entirely new use of cereals in their homes. Domestic baking is economically wasteful, in addition to the other objections to this alternative.

Quoting again from Dr. Taylor's address. "In England there is a large use of rice. In England, Scotland and Ireland there is a heavy use of oatmeal. The people of the United Kingdom will take corn also. The same thing is true of Italy. Corn in the form of polenta is used in Italy, and rice is also a frequent article of the diet. Wheat flour, although used for bread, is not entirely depended upon by the women of Italy.

"The women of France are absolutely dependent upon wheat bread, which forms 52 per cent of the total food of the French people (the present ration is 18 ounces per day), a larger percentage than with any other nation of the world. They eat no rice, no corn; they know nothing of oatmeal and rye, and of barley have little knowledge. The problem rises with France. If we were to estimate the wheat our Allies have raised, add to it the 200,000,000 bushels of exportable surplus wheat from Canada and the United States, and then send the balance of their need in other cereals, there would not be enough wheat flour to go around. You can not make good bread if you have as low an amount as 60 per cent of wheat flour with 40 per cent of other cereals. From a practical point of view, bakers fails to make bread under these circumstances. You can get along on the proportion of 75 and 25. Unless we wish to impose upon the French women the burden of entirely recasting their households, it is up to us to get more wheat to the Allies, and especially to France."

In this connection, Mr. Herbert Hoover, Food Administrator of the United States, says. "For a hundred

BOOKS AND READING ENHANCE FARM LIFE

As evidence that farmers are reading more now than they have in the past publishers point to the fact that a larger number of books are now being sent out over rural mail routes than at any time in the history of the publishing business. And they say these books are not limited to technical subjects, that the demand is for books of a general literary character and quality.

It is a hopeful sign when any class of people begin to read more good books. It means a higher degree of intelligence and refinement, better citizens and more skilful workmen. There has been a tendency on the part of many farmers to look with disdain and distrust upon the science of agriculture as taught from books but that spirit is disappearing and in its stead we find a wholesome desire to acquire knowledge from every available source. This is particularly true of the younger generation, although many of those now past their prime are also alive with new interest to th ethings that pertain to the business at which they have spent the greater part of their years.

There is no way of measuring the value of a good book. Milton said: "As good almost kill a man as kill a good book; who kills a man kills a reasonable creature, God's image; he who destroys a good book kills reason itself." No home, in which there are boys and girls, should be without a fair-sized library of good books. Abraham Lincoln was able to acquire much knowledge from two or three books, but in this day and age it is better to have a well-balanced library of books covering a wide variety of subjects, not only those relating to the work and life of the farm, but some well-selected works of fiction, travel, adventure and history, etc. Such books, kept in neat cases where they are always at hand, help to furnish a home an dsupply a fund of ready information and instructive entertainment.

The advice of Bacon was this: "Read not to contradict and confute, nor to believe and take for granted, nor to find talk and discourse, but to weigh and consider." Anyone who will do this will grow in intelligence and knowledge and will find greater enjoyment in life.

BILL TURNERS WAY

Bill Turner was a farmer; he labored all his life. He didn't have no schooling and neither had his wife. But Bill was built for business and made the wheels go round, and left a healthy fortune when they put him under ground. He was always taking chances, paid 5 hundred for a bull. His neighbors called him crazy, but he left a stable full of cows that broke the record making butter by the ton and Bill he had his picture printed in the Equeedunk Weekly Gun. He had new-fangled notions of making farming pay. He even bought a fool machine to help him load his hay. The neighbors fairly snorted when they saw the bloomin' thing; said Bill would never make it work; it wasn't worth a ding! Bill didn't say a single word, an' didn't care a darn 'bout what they said, fer as slick as grease his hay went in the barn an hour before a thunder storm came sailin' out that way, and caught his neighbors in a pinch and spoiled their new mown hay. Jim Smith put all the milk in cans, and set 'em in a tank. Bill skimmed his milk with a machine and turned it with a crank. To-day Bill's wife rides in a car and dresses up in silk. Smith's wife rides in a wagon and keeps on skimming milk. —Taylor County (Ky.) Enquirer.

HAVE SYSTEM AND REGULARITY IN FARM CHORES

Doing chores is often considered a very unimportant part of the farm routine and one which many try to dispose of as soon as possible regardless of time, quality or circumstances. On many farms they are done just whenever it is most convenient to take a spare hour from some other part of the farm work. This subordinate position to which the chores of the farm are so frequently relegated has much to do with the failure of the live stock industry where slipshod methods are practised.

There are three fundamental principles that should be observed in doing chores, especially on a live stock farm. First, they should be done regularly. Very much of the value of doing things comes from the fact of doing them regularly. When by actual experience one comes to know that a thing needs to be done at certain intervals and regularity is observed in the doing of it, there is little danger of loss through neglect, but when the job is left for a convenient season, that season is likely in many cases to be left too long and damage in one way and another occurs. For instance, stable-cleaning should be a daily matter. If it is not, in most cases it will become a filthy place, and then when any little excuse arises, it will be an easy matter for one to leave it over for an extra day at any time and matters get into extreme conditions too frequently for health or other matters of progress.

Then in the second place, it is found that punctuality is the twin sister of regularity. It is not enough that chores be done every day, every half day, at each end of the day, or, once or twice a week, although in the latter case the difference will not be felt so strongly, but it is essential that as far as possible they hould be done at exactly the ame time. Especially will this apply to the feeding and milking of dairy cows. The animal body is wonderfully subject to influences and when fed for a short period at a certain hour becomes so accustomed to it that a nervous condition arises when the ordinary rule is not observed. Every man wants his dinner at a certain hour and if it is not ready on time he sometimes gets a nervous shck and loses his appetite altogether. He is supposed to be a reasoning animal, and if, with all his intellect he gets into such a state, what should be expected of the horse or the cow that is supposed to have no reasoning capacity, and yet has food withheld now and then for an hour or so and in the case of the cow milk painfully distending her udder? It is little wonder thta she becomes uneasy and nervous. Anyway it is well known in actual experience that herds treated in this way soon fall off badly in yield of milk and individuals come far short of their normal fat production as well as yield in milk.

The third essential principle in doing chores is that of system. Without system in labor there must be great waste of energy. It is much like a man going at his work with his eyes blinded. He never knows just where to go or what to do next and so at every turn he must feel around until he comes in contact with some familiar object in order to get a new starting point. The man who works without system never knows where to find his working tools for he cannot remember just where he left ff and so he must hunt. He frequently misses some part of his work altogether or has to go back over the ground the second time because he has no beaten path to follow.

System avoids the possibility of overlooking any part of the regular work. When one becomes accustomed to a certain routine they will follow it almost unconsciously. Work can then be planned to economize in travel and in doing the work first that naturally plays into the next job on hand. System is a great time saver inasmuch as no time is lost in the various ways enumerated and in trying to overcome them by special effort, many accidents are avoided by always having work well in hand and none forgotten.

FOOD FOR PLANTS

Every reader of a farm paper must have encountered frequently the expression "available plant food." As defined by R. R. Hudelson of the University of Missouri College of Agriculture it means the plnat food which will readily dissolve in the soil water so that the plant can take it up. In the animal stomach there are certain digestive fluids that dissolve the food so that it can be absorbed into the blood stream. The soil must serve as a stomach for plants and as the plant food dissolves in the soil water it is absorbed into the plant juices and moves up through the plant where it can be used. The extra water evaporates from the leaves and moves up, giving a constant circulation. From this it can be seen that only dissolved plant food can be used. Almost all soil materials can be dissolved to a slight extent but often the rate of dissolving is too slow.

* * *

When buying pedigreed stock the wise buyer will study the pedigree of the man who bred the animal as carefully as the animal itself. A good reputation is a good asset in selling registered animals.

PROFITS FROM STEER FEEDING

At the Experimental Station, Kentville, N. S., experiments have been conducted with winter feeding of steers purchased in the fall and turned off in the spring for beef. Eighteen steers purchased in November, 1913, cost 5¾c, and were sold at 7¼c per pound live weight. They averaged 1050 pounds at the start of the test covering 140 days, and when finished averaged 1272 pounds, making a gain of 222 pounds per steer. The average cost of feed per steer was $28.35, or 20¼ cents per day. The averave cost of each steer was $60.37. They sold for $92.22, increasing in value $31.85, which, less cost of feed $28.35, leaves a profit of $3.50 per steer.

Twenty-four steers purchased in November 1914 cost 5¾ cents and were sold at 7 cents per pound live weight. They averaged 853 pounds at the start of the test covering 121 days, and when finished averaged 1091 pounds, making a gain of 238 pounds per steer. The average cost of feed per steer was $24.42, or 20.18 cents pr day. The average cost of each steer was $49.04. They sold for $76.37, increasing in value $27.33, which, less cost of feed $24.42 leaves a profit of $2.91 per steer.

Twenty-four steers purchased in November, 1915, cost 5½ cents, and were sold at 7½ cents per pound live weight. They averaged 842 pounds at the start of the test covering 120 days, and when finished averaged 1065 ponds, making a gain of 223 pounds per steer. The average cost of feed was $25.14, or 20.95 cents per day. The average cost of each steer was $46.31. hey sold for $79.88, increasing in value $33.57, leaving a profit of $8.43 per steer.

November 1916 cost 6½ cents, and coulud have been sold at end of feeding period for 9½ cents per pound live weight. They averaged 858 pounds at the start of the test covering 136 days, and averaged 1154 pounds at the time making a gain of 296 pounds per steer. The average cost of feed was $31.15, or 22.9 cents per day. The average cost of each steer was $55.77. They could have sold March 31st for $109.63, increasing in value $53.86, leaving a profit of $22.71 per steer.

The above steers were carried to May and sold at 11 cents per pound live weight on the 14th and 28th May, sold, making a gain of 35 pounds in 50 days from April first to sale. The feed cost for this period was $12.21 per steer, or 42.42 cents per day. They sold for $130.79 each. The cost for feed $43.36, and the purchase price $55.77; or a total of $99.13, leaving a profit of $31.66, or a gain of $8.95 each above cost of feed, over what would have been made had they been sold at the price offered on March 31st.

It will be noticed that the spread between buying and spreading prices was 1½ cents per pound in 1913-14, 1½ cents in 1914-1915, 2 cents in 1915-1916, and 3 cents in 1916-1917, had they been sold on March 31st as were the others the three previous years. The 1916-1917 sters were, however, held for a higher market with a consequent spread of 4½ cents which accounts for the unusual profits.

The 1913 steers were fed 60 pounds roots, 12 pounds hay, 5½ pounds meal mixture per day on the average. In 1914 they were fed 60 pounds roots, or 45 pounds ensilage, 12 pounds hay, and 8.65 pounds meal mixture per day no the average. In 1915 they were fed 47.6 pounds roots or 32.9 pounds ensilage, 10 pounds hay and 6.17 pounds meal per day. In 1916 they were fed 52.71 pounds turnips or 42.64 pounds ensilage, 10 pounds hay and 5.10 pounds meal mixture per day. It would appear that average of 50 to 55 pounds roots or 40 to 45 pounds ensilage, 10 to 12 pounds hay and 5 to 6 pounds meal mixture per day is a satisfactory ration for economical gain in steers of the size under test during the past three years. The heaviest feeding of turnips or ensilage and the lightest feeding of meal mixture is made at the start of the feeding period, one pound of meal and 60 pounds roots or 45 pounds ensilage being given at that time. The meal is gradually increased and the succulent feed lessened as the period advances.

The meal mixture used was composed for the most part of 200 pounds bran, 2000 pounds cottonseed, 10 pounds cornmeal and 100 pounds crushed oats in 1913, 1914, 1915. Owing to the high cost of cornmeal and oats, they were, excepa at the start of the feeding period, left out of the ration in 1916-1917, and the meal mixture was composed principally of 200 pounds bran, 200 pounds middlings and 300 pounds cottonseed mixed. The mixture used cost $1.50, $1.55, $1.55 adn $1.89 per hundred in 1913, 1914, 1915 and 1916 respectively. The meal mixture used in 1916-1917 to March 31st, was bounght on a low market and at the end of the feeding period the prices of feeds were considerably higher, costing for the last period of 50 days after March 31st $2.25 per hundred.

One shorthorn steer born July 12th, 1914, raised from birth, sold at 20-2-3 months of age for 7½ cents per pound. It weighed 985 pounds, costing $56.75 for feed, leaving a profit of $17.11. The cost was $11.94 for the first six months, $14.09 for teh second six months, $15.06 for the third six months and $15.66 for the remaining 80 days. One born May 17, 1915, was sold at 23 months for 10 cents per pound and weighed 1045 pounds. The cost for the first year was $40.23, for the next 23 months $37.545. The meal fed the first steer averaged 2.32 pounds per day for the period, and to the second 3.26 per day. The second steer was fed the year nearly double the meal given the first one, approximately 3 pounds per day on the average. While some meal is necesary the first year, most economical gains will be made when it does not exceed an average of 2 pounds per day, commencing with very light feeding when the calf is about 6 weeks old and gradually increasing. The meal ration used is equal parts crushed oats, bran and oilmeal.

FIRST AID TO ANIMALS ADD DOLLARS TO INCOME FROM LIVE STOCK

How helpless is the veterinarian when called to render first aid to live stock, unless he has with him a few useful tools or instruments, also some of the common drugs used in everyday practice. If this be true, then the farmer and live stock owner must be at a far greater loss to render first aid to sick and injured animals, unless he is equipped with some tools to work with, and has a few useful stable remedies to give or apply.

Now let us consider for a moment what is required. First, every farmer should know something about the restraint of domestic animals, in order to protect himself against injury when doing minor surgical operations and giving or applying medicine. Besides, every farmer should have at hand a well-made ordinary rope stick twitch. It is made by simply boring a hole one inch from the end of a piece of hard wood twenty inches or more in length, another smaller hole near the other end for a string. Tie a small rope loop in one end, slip loop over upper lip, tighten fairly snug to attract the animal's attention while you work on him. If you have no assistant, tie end of twitch stick to throat latch, and leave it tied until you are through with the operation. You can make a dozen different kinds of twitches, all of which act on the same principle, and may be applied to the lower lip or ear, but preferably to upper lip. Frequently, I find it convenient to use a bridle bit, a large iron ring, a short piece of wood, iron, or iron pipe to twist and shorten the loop; but with this kind you need a helper.

The "War Bridle."

Another simple means of restraint is a "war bridle," which is conveniently made by using a piece of small rope, making a loop that will not slip on neck, passing one end through mouth, the other through the loop; or, use an ordinary neck strap with D ring, attaching a piece of rope to ring, passing it through mouth and back through the ring, then have the assistant tighten rope—this will attract while you are working on him. There are many different kinds of war bridles used by horse-breakers, but I have mentioned the most simple one. Another very useful means of restraint of the horse is a loop and rope gag, which is applied by making a small loop one end of rope, pass rope through mouth, over pole, then end of rope through loop, tighten and tie with one-half hitch; or you may use a rounded piece of leather for mouth with billet one end and buckle on the other, which can be tightened and locked without the aid of an assistant.

Another good means of restraint is a piece of strong strap one and a half inch wide and eight inches long with a ring on each end and straps attached to each end with bucple and billet. These straps should be long enough to buckle around the hind leg of a horse or cow above the hock joint, or above the knees of a horse. This simple appliance will often prevent the horse from striking you while working on head or fore part of body; also, prevent either horse or cow from kicking you with sufficient force to do any harm. It is often very convenient to make a loop with a hame strap, slipping it over hoof, then hold up foot and buckle strap to surcingle or snugly around fore arm; this holds the foot up and very often prevents horse from striking or kicking. When fore foot is held up by hand, be sure and compel the horse to rest his full weight on the three legs. Don't hold up or support the weight of body, or the horse will then be able to kick you with either hind foot.

It is also very convenient to keep on hand a set of breeding hopples, which can be made at small cost. Have your harness maker make two straps, one and a quarter inches wide with D ring fastened three inches from buckle, the billet should be long enough to go around the pastern, shin or above hock at horse's leg. Two pieces of rope five feet long can then be spliced to each ring, one into rings of strap, the other a ring with rope fastened to it. Then pass the rope around neck and fasten it to the ring, which is four or five feet from the hopple, and tie it so that it can be quickly released. This simple appliance can be quickly adjusted and will often prevent a person from being kicked while stitching wounds or applying medicine to the hind quarters of a horse, or cleaning the sheath of a gelding.

Methods of Throwing

Every farmer should know of a simple and safe method of throwing a horse down. Gleason's method is very simple and all that is required is a halter and rein; also a knee strap to tie up one fore foot, and a piece of rope twelve or fifteen feet long. The left fore foot is strapped up, the rope is attached to right fore pastern, passed up over right shoulder and back. Then you stand at left side, push the horse from you, then he drops on both knees. Let him remain in this position for a few moments—gently pull head to right side towards shoulder, then after a little time horse will lie down on his left side, then keep head suspended, both knees folded. Rarey's one man method of casting a horse is similar to that of Gleason's, but knee strap is applied to right fore lef, and the foot raised against the elbow. A rope is then placed around near (left) fore pastern and another around near (left) hind pastern. The leg ropes are then passed through a ring attached to a surcingle and carried over back. The operator, of course, stands on the off (right) side against the horse. The head is drawn around to the opposite side by means of a halter rein, then the operator pulls the ropes and the horse goes down quickly, then he can be tied. Wounds on hindquarters of a horse can frequently be safely stitched by backing the animal against a stall partition.

Restraint of Cattle ..

The ox is extremely susceptible to pain, hence the necessity of prompt and effirient restraint in order to protelt the operator against personal injuries as a result of kisking, as well as goring. A very useful cattle tool is the nose clamp with rope, or if an assistant will place one hand on horn and thumb and finger in nostrils, an ox can usually be controlled. The restraint of one hing leg can sometimes be accomplished by passing tail between hind leg which you aim to control A surcingle buckled tightly around flank of cow will very often cause her to stand quietly and allow you to handle her. A hock twitch is also a very useful tool, so is the knee strap. The breeding hopples can very often be used to good advantage in restraining an ox. In order to cast an ox, secure a piece of rope thirty-five or forty feet long to the horns, pass it along upper part of neck, and half hitch around base of neck; also around chest and flank; place a nose clamp on nose, then the asssitant pulls on rope, and the animal will soon lie down.

Holding the Leg

In order to work on the hog with safety, especially if the animal is aged or large, they should be restrained, and there are many mchaneical devices for doing it. A novel method is to lay a barrel on its side, place some feed in the botton, the hog walks in after the feed, then the barrel can be set on end and the hog caught in this way. Or a loop can be placed on hind leg conveniently. The Champion hog holder is a mechanical device, made of metal and one man can hold a very large hog. A young pig can be suspended in the air either wholly or partially by hand, and an older hog is evenly cast and readily tied. A very convenient method is to pass a rope with loop on it around body back of fore legs, then suspend fore quarters in the air. Another method is to pass a loop around upper jaw back on the tusks and tie hog to post. A shy hog can be snared by baiting one part of slip loop. When he bites the bait, pull rope and rope tightens around the upper jaw back of the tusks. Then tie him to post or tree.

Useful Veterinary Instruments

It always pays a farmer to keep on hand useful veterinary instruments and a few stable remedies, in order that he may intelligently render first aid to injured and sick live stock. A suitable place should be made to keep these supplies in, then when needed they can be easily found. In many localities there is no veterinarian available, and if so, it may be impossible for him to respond promptly to your call; hence, the necessity of being equipped to do emergency work yourself. In the kit of supplies you should have needles of different sizes for stitching wounds, also silk or linen or other sewing material of different weight. You should also have a syringe that holds not less than one ounce, that can be operated with one hand; this instrument is suitable for giving medicine and injecting wounds. You should also own a fountain syringe, which you will find to be extremely useful in washiny out vagina or rectum, or irrigating wounds. Every dairyman should keep on hand a few milking tubes, teat plugs and a teat expander. The farmer should also own a male and female catheter for horses, and also an ecraseur or an emasculator for castrating animals. Keep on hand a clinch cutter and pinchers for removing horse shoes;

HORTICULTURE

STUMBLING INTO ORCHARDING

Some years ago I was induced to take 5,000 apple grafts to grow for a nursery firm. When the trees were ready for market they were oversupplied and asked me to go out and sell them. In order to get anything for my work I had to buy out their shares. I sold hundreds of fine trees five to seven feet high at 10 cents each. I also planted 91 trees on my farm. Two years later I planted another block and two years after that some more. With 77 trees which were on the farm when I bought it and which were set forty years ago, this made me an orchard of 324 trees. They were set 33 feet apart each way."

This summarizes briefly the start in apple orcharding which J. T. Geer of Hampshire county, Mass., made 23 years ago when he set his first home-grown trees. It acounts also for the large number of varieties which are found in his orchards, Mr. Geer was fortunate in having the soil and ocation which are ideal for the production of high quality apples. He has learned the business of orcharding so thoroughly that at the New England fruit show in 1915 he was awarded a silver cup by the Massachusetts board of agriculture for the most prizes won by a Bay state orchardist. Another orchard of 160 trees was planted a few years later, while four years ago 175 were set, some of which showed fruit the second year.

For 16 years orchards were cultivated annually and silage corn or some other crop was grown. The trees made a vigorous growth and bore well, except the Northern Spy. For 17 years this variety showed practically no fruit and Mr. Geer was on the point of grafting them. The Russets alongside, the McIntosh and the other varities had been bearing profitable crops for from six to ten years. A western expert to whom he explained his trouble advised August pruning. This was done and the following year the Spies bore a healthy crop. The heads were not only thinned out in August, but the leading branches were cut back; since then the trees have continued to bear a full crop bi-annually.

Color Lacking in Cultivated Ochards

One year the McIntoshes produced a big yield, but the fruit lacked good color. It was also of such poor keeping quality that he was obliged to make a sacrifice sale in order to get it on the market quickly, and realized only one dollar per barrel. He then gave up cultivation and seeded down the orchard. The color and keeping quality improved wonderfully. "I would not have those McIntosh trees plowed for $500, nor use any stable or hen manure for any amount," said Mr. Geer, " for I know it would work great injury."

The grass is cut once or twice a year and left for a much. The trees are sprayed four times during the season with lime-sulphur and arsenate of lead. Because of their liability to scab the McIntoshes are sprayed six times. The orchards are given an anual top-dresing of acid phosphate at the rate of 400 to 500 pounds per acre and large quantities of lime are also applied. The trees are pruned annually; in 1915 they were given a summer pruning. The apples are very carefully thinned. "It is absolutely necessary to thin the Wealthys if you would grow fruit."

The list of varities includes McIntosh Wealthy, Fameuse, Wagener, Baldwin, Congress, Roxbury, Russet, Spy, Salome, Stark, Pewaukee, King, Walter Pease, Twenty Ounce and a few others. The young orchard comand Gravenstein.

There are two advantages in growing a list of varieties that ripen over a long season, although Mr. Geer says that he would not advise planting some of these. The labor of these. The labour of picking and packing is distributed over a long time, which is a decided advantage, while the customers who his fruit can have it on sale for many months.

A new plan of marketing was tried in 1915 and proved so profitable that it has since been continued. Mr. Geer's orchard is located 17 miles from a large city and half a mile from a railroad siding. He was advised to pack his apples in half bushel peach baskets, because the early fruit brough higher returns in baskets than in barrels. The results were so profitable that he packed in this way the greater part of his crop of 1500 barrels, with the exception of about 25 barrels of prize fruit. A good share sold for $1 per basket. The railroad declined to carry the baskets by freight unless more securely covered than with pink netting. Mr. Geer arranged with his commision man to send out his big auto truck and take in a load of baskets at five cents each, the same price that the railroad charged. This saved one handling at each end, as well as cartage to and from the depots.

Push Young Trees by Good Culture

The young orchard has been pushed along as rapidly as possible by cultivation and free use of manure, 25 spreader loads of manure being used. A crop of fodder corn for the silo has been grown.

Fruit growing is not the only business of Mr. Geer. He has kept a dairy of 12 to 15 cows and raised several heifers each year. Part of the cream was sold in a near-by village and the balance made into butter, which was also sold direct to consumers. Three years ago Mr. Geer became interested in poultry and found them so profitable that he has disposed of most of his cows. During the past season he hatched 750 chickens, which were raised in two stove brooders. This year he will carry through 500 laying hens. The eggs are sold at wholesale, but in the spring there is a large demand for hatching eggs for $5 to $6 per 100.

A piece of woodland has been partially cleared for another orchard. Goats were pastured on it for several years to kill out the brush. They killed everything but the sheep laurel and huckleberries. Last spring Mr. Geer thought to try some pigs to root out the remaining brush, but after three of them sickened and died he gave it up and is looking for some other way to clear the land. He attributed the loss to eating sheep laurel. Have any of our readers had similar experience? Mr. Geer's success can be attributed to hard work and persistence, a love for his business, a soil that is particularly well adapted to produce fine fruit and a location near good markets.—By Edwin C. Powell.

FALL AND WINTER SPRAYING

San Jose scale and peach-leaf curl are best controlled by spraying in the fall after the leaves drop. There is ample time at this season to do the work which always comes in the spring when other things are pressing so hard. The weather is good, there is an absence of high winds and the ground is hard and firm.

Fall spraying is much more effective in preventing peach-leaf curl than spring spraying. In fact, where the spraying is put off until the pink shows in the bud it is often too late to prevent the curl.

San Jose scale is active during the winter and continues to draw upon the vitality of the tree. Fall spraying will prevent this and will save many trees which might be dead by spring. The scales are much easier killed in the fall because they are not so well protected by their hard covering.

Peach growers pin their faith largely ti lime-sulphur because it cleans up both the scale and scab. Recent investigations show that Scalecide has some fungicidal qualities which also makes it effective for the same purpose when used as a fall spray.

Many growers prefer miscible oils for spraying trees which are badly infested with the scale. It spreads further than lime-sulphur and will work around the branches, in the crotches and get under the horny scales most effectively. These materials may safely be used at the winter strength as soon or even before the leaves drop. It is more economical of materials to wait until the leaves are off.

SAVING THE LAGGARD CELERY

It sometimes happens, either through neglect, unfavorable weather, or too late planting, that the late celery crop will not bleach up properly, remaining too green to be edible. When this happens, if it be a good keeping variety, it can usually be saved by the following method:

Take a good-sized packing box and remove both bottom and top. Then bury it partly in the ground, banking earth around the sides until almost even with the top. Now take the best stalks of the celery and closely plant them in the earth in the bottomless box, until the box is filled. Then boards are placed on top of the box to make a double lid or cover that sheds the rain, and completely covers the celery.

Buried in this way, away from light and air, the celery will soon bleach nicely. It can be used as desired, and will come through severe cold weather without injury. It should not be exposed to severe frost in the open trenches before burying, as this is likely to cause rot.—(Ed. Henry.

HORTICULTURISTS VISIT FINE FRUIT FARM

Several public spirited Boston citizens placed their automobiles at the disposal of the visitors to the American Pomological Society's Exhibition recently held in Boston, and one of the trips of much interest taken by the state horticulturists of Maine was to the city of Fitchburg to visit the extensive orchards of Mr. Marshall, which are considered the finest in the world.

These orchards consist of nine or ten thousand practically perfect trees, most of them being of the McIntosh Red variety. Intelligent and up-to-date methods of fertilization, pruning, and spraying have been combined to bring about these results.

Since the methods employed by Mr. Marshall are so successful a few words in regard to them may not be amiss. On the older trees, which have been set about 12 years, the sod mulch system is used. This consists of heavily mulching the ground around trees for an area even larger than the tops cover. In addition to the grass and hay thus used, ground bone is utilized, ten pounds to the tree. The price of potash, which was formerly used, is so high that it is no longer practical.

For the younger trees, those of two and three years, a different method is employed, that of cultivation, crops being planted between the rows.

Generous spraying is employed in these orchards. Besides the dormant spray, used before the foliaye appears in the spring, five sprayings are given at intervals during the summer and fall, while the apples are in various stages of growth, and still later in the season, after the apples are picked, the trees are thoroughly sprayed for the seventh time. Since the cold, damp weather of fall is favorable to the growth of scab on the leaves, which, falling to the ground, send the spores the next spring back to the tender foliage, this last spray is recommended as an insurance for the next year's crop. It also tends to hold the leaves later, thus causing the fruit buds to ripen properly for the next season.

Probably the McIntosh Red apple is the most susceptible to scab of any variety known, therefore it is remarkable that on these thousands of trees there is absolutely none to be found on fruit or foliage. So confident is Mr. Marshall of the efficaciousness of this spraying, that the offer which he has made of one dollar for every wormhold found in the calyx of any apple, has been open for years and he has never had to surrender a dollar.

Mr. Marshall's two cold storage plants which take care of this fruit until it is disposed of, are models of their kind. A perfected ammonia process is used, the pumps being run and automatically regulated by electricity.

This fruit is sorted according to size into five different grades. The first grades are marketed in partitioned corrugated pasteboard cartons holding 100 apples. The smaller grades are sold by bulk and marketed in bushel boxes. There are no secords in quality, all the fruit being perfect.

If the same spraying methods used on this Massachusetts farm and the same amount of care were put into our own orchards, Maine, with her great natural advantages of soil and climate would in a few years boast of hundreds of orchards as fine and producing as perfect fruit.

CONSERVATION AND UTILIZATION OF FARM MANURE

(Experimental Farms Note)

All investigation go to show that farm manure has its greatest value when fresh, that the liquid portion is richer than the solid material and that the former is more readily lost through drainage and leaching. Hecen it is that every precaution is taken here to ensure a minimum loss of plant food constituents in the manure and is the chief reason for applying manure to the land, where practicable, as quickly as posible after it is produced.

At the Central Farm, Ottawa, the liquid manure is absorbed by means of litter usually cut straw, and as each load of mixed liquid and solid manure is gathered it is taken directly to the field and is spread on the land either by hand or by means of the manure spreader, as convenient. This method is carried on consistently throughout the year although during occasional winter seasons this system may be disorganized for a time due to the depth of snow or other causes. The contour of the land at this farm varies from fairly level to gently rolling lends itself admirably to the foregoing plan of procedure.

The manure is always applied systematically in definite cropping systems or crop portions. The amount and frequency of application vary according to the duration of the rotation, but, without exception, in the regular farm rotations, six tons per acre of fresh manure is alloted to each year of rotation. For instance, in a three-year system, of hoed, grain and hay crops, eighteen tons is applied for the hoed crop. In four-year rotations twenty-four tons is the quantity used. For a five-year rotation the amount is thirty tons of which the balance is spread in lighter dressings for the clover and timothy hay areas.

Where manure is applied for cultivation or hoed crops the importance of incorporating the manure thoroughoughly with the soil as near to the surface as practicable is closely observed.

GROWING RHUBARB DURING THE WINTER

Fresh rhubarb during the middle of the winter is easily obtained by anyone who has a few spare rhubarb roots in his garden.

Just as the ground is about to freeze at the commencement of winter dig two or three roots, lifting them with as little damage as possible. Put these roots in an outside

shed or somewhere else where they will freeze solid but will not be buried with snow. After they have been frozen for two or three weeks, take them indoors, put them into the bottom of barrels, filling in around the roots with soil, sand, sawdust or other moisture holding material; set the barrels in the cellar or some other place where there is some artificial warmth, keep the roots dampened, and cover the barrels with a sack to darken the inside.

Under these conditions a root of rhubarb will grow almost as many shoots as it would during the next summer, and by darkening the atmosphere the shoots will be tender and well blanched. The amount of earth surrounding the root is not very important, as the growth is largely independent of any feeding upon the soil, the material for the shoots being taken directly from the stored food in the roots.

When spring comes the roots may if desired, be again planted in the garden; but they will be so well exhausted as to reqhire abodt two or three years to come back to their normal condition.

WINTER INJURY TO PEACH TREES

The winter injury which peach trees frequently suffer may appear in several different forms, some of which are quite common while others are less common but of far greater significance. The fruit buds may be killed, the branches and twigs may be killed, or the roots may be killed. One should be able to discern these differences for the results in each case are of different consequnce. Bulletin 241, of the Ontario Department of Agriculture, discusses these three forms of winter injury as follows:

The first form is most noticeable because it is marked by a small crop, or the total absence of fruit. This form of injury is caused most largely by a very sudden drop in temperature, following a warm spell in winter, such as occurred in January, 1914, or sometimes the first farm days of spring having opened the buds the blossoms are exposed to frost or cold, adverse weather conditions late in the spring. Cultural methods are of little avail in such cases, except in so far as good cultural methods tend to keep the trees thrifty. A site for the orchard that is not subject to these conditions is the best insurance against loss.

The second form of winter injury, viz., the killing of branches or twigs and possibly the blackening of the hearts of the main limbs and trunks is more readily guarded against. This injury is most common in over-cultivated orchards, over-pruned trees, or under any conditions where soft, sappy growth has been produced. The remedy lies in more judicious cultural methods that would tend to keep the tree vigorous and healthy, but not overgrowthy. The slower growing and slower maturing trees are the most resistent to cold.

The third form, root injury, may be due to a number of causes. Peach roots cannot withstand excessive moisture. Roots in a poor soil lacking in humus suffer from deep freezing and are themselves weak from want of food. This form of injury can be detected by the behavior of the tree in early spring. It may begin to leaf out and even open its blossoms, but in a few days begins to lose color and in a time, ranging from a few days to mid-summer, gradually but surely die. It is expected that the trees are budded on the most hardy roots obtainable, because beyond this there is no insurance against loss except the removal of surplus moisture by ridging up with the plow in the fall and the prevention of deep freezing by mulching with farmyard manure. A cover crop that holds the snow is an insurance against deep freezing. Judicious cultural methods are again the best form of insurance.

When pruning young pear trees, thin out any limbs that cross or interbranches that will at a later date form the framework of the tree. Cutting-back or heading-in is not considered advisable. This may be neccsary in exceptional cases in order to properly form or balance a treee, but it should be done out of extreme necessity only. A bearing tree is less susceptible to blight but even here it is considered advisable to reduce pruning to a minimum. A little pruning regularly, March and August, might be considered a reasonable rule.

LEAVES A NEGLECTED FERTILIZER

There are thousands of tons of humus-forming fertilizer lying neglected in our woodlots, especially in the sugar maple woods—leaf mold which gathers in the low places sometimes six to 10 inches thick. The dead leaves have accumulated through many seasons and some of the nitrogen has of necessity leached out, but very little of the mineral plant foods. This soil-building material does not incorporate with the soil so quickly as stable manure, but contains all the necessary elements of plant food. It is easily handled when moist with either a spreader or manure fork.

I have 20 acres of dense sugar tree woods where the ground was matted with leaves so deeply that not even weeds would grow. Last season this was taken up and spread on an adjacent upland field to be planted to corn. The mold was generously applied and plowed under. The corn stood the drouth much better than the crops in the bottoms. After the ground in the woods was bared it was sown to orchard grass which grew luxuriantly. Thds a benefit was derived in two ways.

Time could not be more profitably spent than in hauling this natural fertilizer to the fields when the farm work is slack.—(W. L. Cumback.

LITTLE PROFIT IN DRUG PLANTS

Unless you are content with a wage of 50 cents a day don't monkey with Horticulture U gathering the weeds that grow wild and are valuable for medicinal purposes. A special committee of the Philadelphia society for promoting agriculture appointed to investigate the cultivation of drug plants reports that it is a precarious business which holds out promise of profit only to those who have learned it. Most people are ignorant of the market and of possible purchasers. The labor cost of collecting weeds appears almost prohibitive.

A PEAR OF HIGHEST QUALITY

This is a popular and profitable pear in many localities. Because it is necessary to double work the trees they cost more than other varieties, and on this account have not been planted so largely. The pear is large in size, rich golden russet in color, and surpassed in flavor by few others. The fire blight, which is so destructive to many varieties, seldom attacks this tree. They need careful pruning and training to make a shapely tree.

CULLED FROSTED POTATOES

Sort potatoes and remove frosted ones before shipping as a few of these in a sack may ruin the entire sackful during shipment. Potatoes, labor, freight charges and car space will be saved. The frosted potatoes may be used for stock feed. Potato growers are urged to market their potatoes throughout the year. An even flow of the crops through the channels of trade will aid in stabilizing the market and prevent waste.

DAIRYING.

DAIRY SIRES THAT ARE CHEAP AT ONE THOUSAND DOLLARS

One of the most puzzling problems confronting dairy farmers and breeders of purebred dairy cattle is that of how large an investment it is safe to make in a breeding bull. With purebred bulls selling at prices from $50 to $25,000 and upward it is well for one to make a careful study of what constitutes merit in a breeding bull, before investing in qualities that are not apparent to the eye.

Since heavy milk production is not a natural, but an acquired characteristic, it is only by constant selection that this quality can be retained and intensified. Unless the breeding bull has inherited heavy milking qualities through his female ancestors we have no evidence that he will have the ability to beget daughters that will prove superior to the cows with which he is mated. In order to retain the milking characteristics of a good grade herd, it is necessary to use a bull that has inherited these characteristics to a stronger degree than the cows. This makes it imperative in all herds where progress has been made in raising the average milk and butter fat production, that the sire be selected with great care, especially regarding the milking qualities of his nearest female ancestors.

Almost any purebred bull that can be purchased for $100 will improve the milking qualities of a grade herd, but for the more highly developed herd it is much more difficult to select the proper bull. Breeders of high producing dairy cows recognize the importance of selecting a bull that will transmit the acquired milking tendencies to his ancestors to the fullest degree. These breeders are always ready to make use of breeding bulls that possess the ability to strengthen the blood lines in their herds and exert prepotency toward uniform offspring and dairy qualities. Price is of small consideration when they find a bull that combines the qualities needed to bring about the desired improvement in their herds.

Where so many dairy farmers have apparently failed in the effort to build up their herds of grade cows was in, after seeing the great improvement of the first cross with satisfaction and attaining with the second cross much less results than were apparent from the first cross, abandoning all future efforts to grade up. The first cross of a pure-bred sire on account of the much better quality of the sire, if a proper selection has been made and his greater prepotency, is apt to be very striking. Such a sire will exert much more than fifty per cent. influence and the dam much less than fifty per cent. upon the progeny. While in the first cross there is existing a wide difference between the quality of the purebred sire and the quality of the common bred dam, when it comes to making a second cross the difference between the half-bred dam and the purebred sire is much less, and the three-quarter bred stock will show much less improvement over the half-bred than the half-bred cows over the common bred cows. Hence many dairy farmers are apt to conclude that it is hardly worth while to pursue these lines of breeding any further if they are not to get the same results with each cross, and right here the mistake is made of stopping improvement. The results are being attained as rapidly as possible, but are not so apparent from year to year. When the process of breeding up through the use of improved sires is abandoned the tendency is for production to go backward.

Right here is where the importance of selecting better sires is apparent. It would be important as well as interesting if we had the results of definite experiments to guide us in our breeding efforts. What would be the probable results of mating a bull from a line of dams capable of producing from nine thousand to ten thousand pounds of milk per year with common bred cows capable of producing five thousand pounds of milk per year, and what effect on the progeny would result from using a sire with breeding capable of producing five hundred pounds of butterfat with cows capable of producing two hundred pounds of butterfat? Such data, if only approximately correct, would give us more accurate figures to base our estimates of breeding values on and prove of great value in determining prices that one could afford to pay for breeding bulls to carry out his ideas of improvement. While the experienced breeder of dairy cattle realizes the importance of using a sire that is superior in inherited capacity to his cows the average dairy farmer does not give the question of the selection of a sire the attention that the importance of the question demands.

The process of breeding up a herd of dairy cows to a high annual standard of production depends upon using breeding bulls that are superior in inherited dairy capacity to the cows with which they are mated. As the cows reach a higher standard of production the problem of selecting a better bred bull to mate with them increases. As a rule, the better the cows in the herd the more one is safe in investing in an improved dairy sire.

The returns from an investment in a purebred breeding bull will depend very largely on how the investment is increased. Perhaps if you have a number of cows that have made creditable milk and butterfat records an investment of many thousands of dollars in a purebred bull may prove profitable. Provided he is given good care and an opportunity to transmit his good qualities through some of the best cows of the breed you may increase the investment until he becomes far more valuable than can be computed in dollars and cents. So much depends upon how the investment is increased that it is difficult to advise how much one is safe in investing in a purebred sire. The Holstein-Friesian breeder who paid $25,000 for Ray Apple Korndyke 8th is increasing his investment through buying many of the best cows of the breed, conditioning them for high records, mating them with his famous bull and selling some of his young bull calves for from $2,000 to $20,000. Such returns would not be possible had he used him with only a few good cows and waited for years before increasing his investments in superior blood. The breeder must have thusand dollar cows before he is safe in investing in thousand dollar bulls and the dairy farmer must have high grade cows before he is safe in investing in bulls that cost him more than from $100 to $200. Provided he has a few purebred cows to increase the investment he may be safe in buying a better bull, but it is unwise to invest too much in a bull until some of the cows in the herd begin to make creditable milk and butterfat records.—C. B. F.

IN SUCCESSFUL FARMING.

FEEDING THE COW ON TEST

Individuality Must be Studied....

In reply to an inquiry re how a cow should be fed and managed for a seven and a fourteen day test, the Ottawa Valley Journal says:—

There are no hard and fast rules that will always apply to cow-testing. There are some general principles, however, that, in the main, are applicable but even with these the cow will not always agree, but demand something especially for her own benefit; hence in a large measure cow-testing has come to be regarded as an individual matter.

A dairy cow cannot be regarded simply as a machine for making milk. She is that, in the sense that she is able to transform the raw material of the farm into one of the most delicious, valuable and indispensable articles of food for man and beast, that is to be found upon the face f the earth, but she is vastly more than that; she is a living force, possessed of a strong nervous temperament which is capable of being influenced by many considerations.

It should be understood that there are four main centres of activity in the dairy cow when she is performing her milk functions; the digestive system, the milk secreting system, the circulatory system and the nervous system, all of which should be considered at all times, but more especially when she is undergoing the pressure and strain consequent upon the practise of cow testing. It will readily be seen from these considerations that feed is not the only element that influences the milk yield and butter fat content of a cow's production, but that anything that disturbs the equilibrium of these functions reacts to the disadvantage of the cow in every direction, therefore the first consideration in testing for milk and butter fat production is to maintain the balance of all the organs by proper care and management so that each will contribute its full share toward highest development and not be, in any sense, a brake upon the other organs of production.

There are still many who think that a cow should test the same at every milking. They will do this, however, only when long periods of time are included and when conditions are similar, and even then there will be unaccountable experiences of variation. It is true that a high-testing cow will always test higher under the same conditions than will a low testing cow but even in this there will be occasional exceptions. As is well known by experienced feeders, a cow subject to various annoyances, such as the irritation of flies, or excitement caused by dogs will drop in her butter fat test; unless a cow is protected from these abuses no good testing can be

What is Crushed Coffee?

Briefly, Crushed Coffee is coffee that has had the beans crushed between steel rollers with just enough pressure exerted to break the beans into clean, even grains from which the bitter chaff and dust are easily separated by air suction—

Resulting in a coffee so pure that no egg is needed to settle it. Red Rose Coffee is as easy to make as Red Rose Tea, and its flavor, aroma and smoothness are a delight as compared with the ordinary ground coffees.

Sold only in double-sealed air-tight cans to keep it good.

The same price as it was three years ago. 671

PULVERIZED LIMESTONE

SWEETENS THE LAND AND PRODUCES HEAVY CROPS

The demand last season for our "Clairmont" Brand Pulverized Limestone was so heavy we were unable to fill a great many orders. We expect a very heavy business for 1918 and would advise all booking now and getting their supply early. Our Limestone is showing wonderful results.

Avdertise in the FARMER

accomplished at certain times of the year.

The feeder in his endeavor to get a high test frequently treats the cow in the wrong way. At fairs where milking contests for short periods are carried out it is not always the best cow that wins the contest. Many high testing cows owing to exciting or abnormal causes, to change of rations, increase of food, etc., suddenly fall off in their test while at the same time they hold in their quantity fairly well. On the other hand some ordinary or even low testers increase in their test materially. Owing to this fact the poorer cow frequently wins and the normally best cow fails. Usually the feeder is at fault. Experience teaches that any increase in food should be made very gradually. Where a cow has been on heavy rations the safer way is to cut down the amount of feed and let the smaller amount be in the form of concentrated protein. This protein is easily digested by the cow leaving the blood free to travel to the udder. Fat which is placed in the milk, is not taken from the food that the cow eats during that day, but is contained in the blood or is taken from the cow's body fat.

The temperature of the body has much to do with the fat in milk. Some increase it by blanket-sweating or drugs. This is wrong and forbidden by the breeders' associations. The fat may also be increased by careful feeding; not to any considerable extent, however, by the kinds of feed but to a much greater extent by the quantity and manner in which they are given. Too heavy feeding, thus keeping the digestive organs crowded, the blood tardy and overloaded, and the nervous system depressed, is bad practise. Just enough feed should be given to carry a cow to her limit without forcing, thus will all the organs be able to perform their functions naturally.

No general rule for feeding can be given that will be suitable for every cow in a herd. Cows are individuals and must be treated as such for best results. One pound of meal concentrates to four pounds of milk will be suitable for one while another may give better results on a ration of one to three. Some cows like one kind of feed better than others. They should be humored in their whims, if whims they be, but it may be that they are better judges of their needs than their feeder.

One of the most important factors influencing both the quantity and the quality of a cow's milk is the condition she is in. One pound of grain when a cow is dry is worth two pounds after she freshens. The principle is the same as in other phases of farming. If one wants to grow a good crop of grain he does not wait until the crop is sown before making preparation and putting his land in the best condition. The cow that is fat when she freshens has the same advantage over a thin cow that the seed sown on good soil has over that sown on poor land. It is now well known that a cow will give a higher fat content in her milk when falling off in condition and a lower test when gaining in flesh. If a cow is fat, therefore, at freshening, she will have an opportunity to secure the best results in the following lactation and should be fed so that she will decrease slightly in weight as her milking period advances.

Some breeders fear having their cows in a fleshy condition at freshening on arcount of the danger of milk fever. This need not cause any alarm however, if the cow is properly managed at that time. The cow should be on full feed the same as when milking until about ten days before threshing. Then a bran mash and other laxative feed should be given instead of heavy grains, and continued until four or five days after calving, when the udder should be soft and in good condition. Then with care in milking only small quantities from the udder for the first two or three days and at no time milking her dry at this time all danger of milk fever will be avoided. If at the end of five or six days the cow's udder and general condition are all right the feed may be gradually increased until the cow is on full feed at ten to fifteen days after parturition.

Regularity in feeding and milking is of the greatest importance. If a cow is not fed and milked on time she becomes uneasy and nervous and in some measure is shocked at the delay, which operates against the highest success. The time between milkings should be evenly divided and where more than one is to be milked by the same person the same order should be observed at each milking. Fat in milk is also influenced to some extent by the time between milkings. It is also advisable that the same milker should milk the same cows every time. Some cows manifest a decided preference for certain milkers. Where this is the case better results will be obtained by the man of her choice than where her likes are disregarded.

Some testers turn their cows out on to fresh grass when beginning a record. This is usually not a good plan. A cow will almost invariably increase her flow but almost always at the expense of her test. Grass is cooling to the system and as bodily temperature increases fat, grass operates against it. Cold water has the same effect and should not be given until the chill is taken off.

After all is said that can be suggested on testing the fact remains that the feeder is the biggest factor. Nothing will take the place of his study of the individual cow and the over-ruling of all things for her particular benefit.

If one uses a variety of feeds, it is possible to force the young pigs along and obtain desirable results. If the pigs have an opportunity to exercise while eating grass or other coarse feeds, like rape, clover, or garden weeds thrown to them, they can be fed a liberal quantity of a variety of grains, such as part corn and part millfeeds, with excellent results.

For several days after freshening the cow should receive special attention, such as being given a reasonable amount of warm water to drink, bran mashes made of two pounds of bran, a pound of oats, a pound of oil meal and a handful of salt, and a little good hay. She should not be given cold water within three days after freshening.

BRONCHITIS AND BRONCHO PNEUMONIA IN THE OX

The parasitical form of bronchitis or husk will not be alluded to here, but only two forms, and although one form is probably due to various micro-organisms, yet both, it will be assumed are "mechanical" and produced by exetrnal causes only. Each of the two bronchi (the terminal branches of the trachea) resembles a tree imbedded in the substance of the lung; each bronchus enters the lung of its own side, diminishes in size and finally ending in little sacs or air-cells suported by elastic tissue, and carrying the capillaries of the ultimate ramifications of the pulmonary artery: thus the blood in these capillaries is exposed on both sides to the air. The expired aid, whatever the temperatufe of the extenral air, is nearly as hot as the blood, and however dry the external air, the expired air is nearly saturated with watery vapour. Air which has been breathed once loses roughly 5 per cent. of oxygen, but has gained 5 per cent. of carbonic acid. There is also given forth by expilation a greater or less quantity of matter of a highy decomposable character.

An ox in health breathes about twelve to eighteen times a minute, the pulse numbers from forty to fifty per minute, and the temperature varies from 101.5 to 102.5. Although mechanism, physical and chemical, that takes place in respiration is somewhat complex, yet we can arrive at two true conclusions, viz., (1) that abundance of fresh pure air (not that contaminated with exhalations from decomposing dung and urine) is necessary for the maintenance of good health, and breathing for many hours a vitiated atmosphere results in ill-health, and (2) that the air tubes and their terminal bronchial divisions are very susceptible to atmospheric changes by reason of the great sensibiity of the mucous membrane which constitutes the walls. Hence the comparatively frequent occurence in the ox of bronchitis, acute or chronic.

Acute bronchitis is recognized by increased respirations—the inspirations being difficult—wehreas the pulse beats are much increased; the animal does not flinch upon pressure being applied to the sides of the chest as it would do from pleurodyne, neither does the patient look at its sides as it would do if suffering from pleurisy. The cough, however, comes on in paroxysms, is frequent and distressing, owing to blocking up the air tubes with mucous. One notes that the visible mucous membranes are lead-colored owing to imperfect oxidation and the results may be serious, such as suffocation from complete blocking of the air passeges or from extension of the inflammation to the lung tissues generally.

The air passages possess ciliated epithelia, and these vibratele cilia are so to speak, the brooms constantly acting in sweeping and forcing forward mucus and foreign particles from the bronchi to the mouth or nasal chambers; the long flexile tongue of the ox sweeps clear the lower part of the nostrils. Some of the particles are dropped to the ground and part swallowed.

Treatment

Put in a comfortable loose box where a free supply of pure air is obtainable, giving tempting food and varied, to keep up the patient's strength, and if the weather is cold the body should be clothed in sacks with a thin layer of straw between skin and coverings. Some white oils or turpentine or mustard may be rubbed in occasionally on course of windpipe and sides of chest. From the difficult and distressed breathing do not attempt drenching. Give the following medicine, one tablespoonful smeared on the inner side of the lower molar teeth three or four times a day; Two ounces each of powdered chlorate and nitrate of potash made into a stiff paste with honey or treacle. If the appetite fails and depression is severe incorporate a dram of sulphate of quinine in the above quantity. Offer frequently cool fresh water. The bowels are sure to somewhat inactive, but do not give laxatives or cathartics, though enemas of soap and water will answer all purposes.

The breathing will be relieved the stringy, thick mucus made thinner, and a general curative effect helped by medicated steaming once or oftener during the twenty-four hours. This can be provided by the means of an ordinary quart tea kettle, the water kept boiling by a lamp and the spout fitted with a length of rubber tubing in which is inserted the terminal fan-ike nozzle of a water-can; the steam thus diffused can be admitted to about eighteen inches of the animal's nostrils and kept there for ten minutes at a time . After once using, the medicament in the kettle must be renewed. The following forms a valuable inhalent: Half an ounce each of Friars' Balsam, oil of eucalyptus, and turpentine. In the course of a fortnight, with good nursing and attention, the breathing should become natural, the appetite and rumination return, nasal discharge watery, and the cough less frequent.

It is a noticeable fact that the ox when suffering from lung affections often remains in the recumbent position, whilst the horse persistently stands under similar circumstances. This can be accounted for by the differences in the anatomy of the ox and the horse; the former has only thirteen ribs and the horse has eighteen, but the posterior ribs of the ox are longer. The flat sternum of the ruminant permits repose on the interior surface of the trunk, and owing to a synovia union this position leads to lateral expansion of the chest.

Chronic Bronchitis

is a sequel of the acute form, and the symptoms are a pesistent cough, debility, shortness of breath when undergoing unusal exertion, and loss of condition. These symptoms may also suggest tuberculosis, and it may be necessary to test with tuberculin. Treatment consists of shelter from cold winds and rain, a dry floor with plenty of litter, generous feeding, and tonics. These will do much, but when the disease is confirmed, slaughter is probably the best course. Mechanical bronchitis and

Broncho-Pneumonia

is usually caused by careless drenching. Oxen are so much easier to drench than the horse that the operator forgets the possibility of some portions of the drench entering the larynx and the trachea. Drenches should be administered slowly and in small quantities at a time; the head not held too high or turned on one side, and the act of coughing should warn that the head is too be dropped at once, and time given before proceeding further. All irritating drugs should be well diluted with a sufficiency of bland fluid, such as oatmeal gruel, etc. In lung troubles and acute tympany do not drench. If the quantity "gone the wrong way" is large death may ensue in a few minutees from suffocation, but usually in about forty-eight hours broncho-pneumonia with dyspnœa will supervene.

Chronic Cough

This so frequently occur in cows without any signs of ill-health, and though in this article acute diseases causing coughs must be omitted, and also the cough arising from tuberculosis, there are other causes that may be mentioned. As seen in this article a cough may be left after an attack of bronchitis following catarrh, and this may perhaps be the commonest type, the cough being loose and mucus often coughed up. Any little exposure to wet or cold increases its frequency.

A cow that has had a slight attack of pleurisy that may not have been diagnosed has often a cough due to some adhesions to the lung.

The ordinary catarrh affecting the throat and larynx, such as sore throat would hardly be recognized unless a cough.

But we must not forget that a cough very bad, and this may terminize in is one of the symptoms of tuberculos which may not seemingly affect the health of the animal.

Treatment is difficult owing to the various causes, and it is not convenient to keep the cow in byre or more comfortable uarters for so slight a trouble. Try to find out if there is any irritability of the throat, and if so some white oils well rubbed on throat every second night will soon relieve it.

If from bronchial trouble an ounce dose of paregoric mixed in a linseed mash every night for a week would alleviate the coughing, but exposure to wet or cold would probably bring it back again. So the best treatment is hygenic—well ventilated byres, sunshine and fresh air, and clean, dry floors, whilst the dung heap should be as far removed from the byres as possible.

In young stock there is always a probabilaty of husk but this is a specific disease and requires different treatment.

M. R. C. V. S.

BEGINNING WITH SHEEP

As boy and man, I had the care of sheep on a New England farm for a great many years. Because of my long-time interest in the business, and my belief that its development would be a great benefit, not only to the men who keep the flocks, but also to the section in which they live, I would like to make a few suggestions to prospective beginners.

Among the things which they will be wise to do are the following:

Provide suitable quarters for the sheep and for the lambs which they are expected to bring forth. These places should be so arranged as to give full protection from storms, and from enemies of all kinds, and to promote the health and comfort of the flock. Special attention should be given to furnishing a safe place for the lambs. Arrangements for feeding and watering should be made with reference to the wants of the animals and also to the convenience of the man who will have charge of the flock. And these things should be done before the sheep are brought to the farm.

Get good stock — Because of the limited number of animals from which he can choose, the buyer may not be able to obtain just what he would like, but he should get the best that he can, both as regards the breed and the qualities of the individual animals. It will be extremely poor policy to buy a low grade stock if anything better can be secured.

Begin on a small scale—This is a good way to start in any business. It is highly important to one who is about to engage in the sheep industry. My father commenced with one lamb which was given him by a neighbor who did not want the trouble of raising it by hand. In a few years he had a fine flock.

Read books and articles in farm papers on sheep and their management; also, if possible, visit some of the farms on which sheep are kept, and observe how their owners have arranged and furnished the barns or pens, and how they feed and care for their flocks This wil enable one to start in the business intelligently, and thus it will be a great help toward making it a success.

The outlook for the sheep industry in the eastern states is good. It is true that, for various reasons, a good many farmers cannot engage in it at once, or even in the near future, but there are a great many others, who are more favorably situated for it, to whom it offers an excellent opportunity for interesting and profitable effort. It will be well for such men to take up this work promptly, and with the intention of making it a permanent part of their farm business.

J. E. R.

CONCERNING VEAL

The questions have frequently been asked: Why has not the food controler prohibited the use or veal? Is it not an economic waste to kill the young animals?

"These queries bring up several very debatable points," says a bulletin from the food controller's office. "There is no doubt that it is good business to bring to maturity such calves as give promise of converting their feed into profitable beef or into profitable dairy products. But it lessens the farmer's output of milk and butter and his supply of feed to no purpose when poor calves are kept. Very often calves give no promise of rendering returns either in beef or milk. Thus male calves of dairy strain, that cannot by any chance be expected to yield economical beef as steers, bring net profits only when slaughtered as prime veal.

"To get best results from any herd, a certain amount of weeding out, particularly among the females, is essential. Only thus can the beef possibilities and the milking qualities, respectively be maintained and improved. It may be remarked here that the majority of veals slaughtered are males from dairy herds.

"It is evident then, that the consumption of veal could not be prohibited yithout entailing present loss, unprofitable feeding, and future deterioration in the herds.

"Strangt to say, although nearly everybody has eaten veal, and Canadian householders have bought and handled it for generations, few, very few, people know even approximately how to define it.

"A calf to be classed as prime veal should not be younger than four weeks nor older than eight weeks. Also, although the beef veal calves are of beef breed, yet, when well fed and well prepared, the dairy-breed calf makes excellent veal. As a matter of fact, the greater part of Canadian veal is from dairy stock.

"A prime dressed veal carcass weighs 65 to 70 per cent. of the live weight, whereas, incidentally, a good beef carcass runs only 55 to 59 per cent. Ordinarily, the weight of a veal calf ranges between 100 to 200 pounds; but the choicest weight lies between 120 to 160 pounds.

"Veal should be eaten fresh. The best cuts come from the hindquarters. The brains, tongue, heart, liver and lights, are valuable and delicate foods. Sweetbreads, two glands, one near the base of the throat, and the other near the heart, are found only in calves that have been fed exclusively on the mother's milk. They begin to disappear as soon as the calf is put on grass or solid food.

"From 150,000 to 180,000 calves are marketed in Toronto annually; and from 350,000 to 380,000 in Montreal. More than half are received during March, April, May and June. Except in decennial census years it is improcticable to determine the number of veal calves killed outside of the large stock yards.

"The production of veal is looked upon as entirely subsidiary to the output of beef and of dairy products. Veal is essentially a by-product of the beef and dairy industries. No greater mistake could be made than to regard it in any other light. To illustrate this we may cite the fact that out of lots of 43,342 calves received at Point St. Charles, Montreal, this year, 9,400 could have been matured for beef. The same

was true of 8,914 head out of 34,031 calves arriving in Toronto. Taking then the average of 22.6 per cent. at least 113,000 calves of a total of about 540,00 arriving at Montreal and Toronto throughout the year should not be slaughtered as veal. The problem thus narrows itself down to devising some methods of saving this 22.6 per cent.

"Summing up, briefly, it is good business to cull out and 'veal' calves of either beef-breed or dairy-breed, when it is clear that they will add nothing to the total wealth of the country."

FRAUDULENT OLEO RIGHTLY FEARED

(Chicago Dairy Produce.)

The dairymen and the allied interests of Canada are beginning to wonder if they haven't, in the introduction of oleomargarine into their country, got something that is going to give them considerable trouble to manage. Speaking from years of experience, we wish to assure our neighbors that the history of the sale of this product up to the present time, has been one of deception and violation of law.

The great trouble has been that some of the largest manufacturers of the product, when it first came upon our markets, found considerable difficulty in getting the consumers to buy it in its white or natural color. They wanted butter; and, as the field for the sale of oleo, was large and inviting for the perpetration of fraud, hundreds and thousands of small places were opened all over the country. These were occupied by unprincipled tradesmen and the hunters who peddled the goods direct to the consumer. They would buy direct from the manufacturers of the product five, ten, twenty-five and even one hundred tubs, take it to their back rooms or basements and rework and color it and sell it to the consumer for butter. Millions of pounds of it was sold to consumers annually in this way.

But the dairy interests were not asleep. The enforcement of the oleomargarine law, the passage of which was secured by the National Dairy Union, was entrusted to the revenue department, because it is a revenue measure; and as that department is purely a money-making department, for a long time little attention was given to its enforcement. Urged on, as they were, by the dairymen, they were forced at last to look after violations of the law, and convictions were obtained until our penitentiaries were well supplied with these criminals. Many violators of the law are still behind prison walls for their persistent disregard of the law, and some of the largest manufacturers are still under indictment, and a few under prison sentence, but have managed in some way to put off enforcement of their sentences.

This has been the history of oleomargarine since its inception. It seems to have been BORN IN FRAUD, and its existence perpetuated in the same atmosphere. Had the product been good and wholsome, why the necessity for this deceit? Why the constant struggle to sell it for something it is not? Why did they not come out and sell it for what it really was?

At one of the hearings held in Washington, D. C., one of the largest manufacturers made the statement that he realized the greatest mistake they had made was in not introducing and selling oleo for just what it was.

We believe that the awakening fears of the dairymen of Canada are well founde, and this belief is based upon a personal contact with the record of oleomargarine in this country for over twenty years.

Did the green-lice get your potatoes or did you get them? Those who sprayed thoroughly and in time with tobacco extract saved their crop. Be prepared for another year.

THE HORSE

WINTER CARE OF FOALS

The advice given in this article is intended more especially to help the young farmer in the matter of how to feed and care for his foals during the first winter, so as to get the largest mount of profit from them—a problem that many a small farmer, who is just starting in the business and is raising one or two foals a year, has studied hard to solve.

The first thing to decide is whether or no the foals are to be trained to compete for any of the rich futurities or are to be kept on the farm, running at pasture during the summer months each year, and not offered for sale until matured and ready to use as roadsters or all-purpose animals. Those that are to be trained and raecd young will require different threatment to those that are to be raised on the farm.

Feed

The later class should have as comfortable quarters as the former, and as great care should be used to keep them free from lice and worms and their feet free from thrush. They should have all the early-cut, well-cured ahy that they will eat, but their daily grain ration should be less than that of the foals which are to be trained young. A pint each of sound clean heavy oats and sweet wheat bran mixed for one ration, and three rations a day at regular hours, morning, noon and night, which will be one and a half quarts each of oats and bran a day, in adition to all the good hay they will eat, should keep a foal in thrifty condition. A large spoonful of flaxseed meal should be added regularly to the night ration.

It will be an advantage to feed this ration once a week at night in the form of a well steamed mash. Put the ration in a pail pour as much boiling hotwater upon it as the mixture will absorb; when swollen stir so that every part of it will become moistened, then cover the pail closely with several thicknesses of blanket or anything that is convenient, which will prevent the escape of steam; set by the stove and let it remain several hours, and feed warm.

Feeding Apples and Potatoes

It is a good plan for the small breeder to teach his colts to eat raw apples, potatoes and carrots, and feed one or two a day of either. Horses and colts are very fond of apples, especially sweet ones, and it is but little trouble to teach a colt to eat them. The apples and potatoes should always be either sliced, quartered or halved before feeding no matter how small they may be, so as to avoid danger from choking. It may be necessary to wash the potatoes and cut them into thin slices or small cubes and sprinkle fine sugar upon them in order to induce the colts to eat them at fist, but they will soon eat them without the sugar. Some farmers teach hteir weanings to eat crushed sugar which comes in lumps, or cut loaf sugar, and t is a very good idea, for there is no more convenient or economical method of giving liquid medicine in small doses than to drop it on a lump of sugar and feed it to th colt. It will be eaten readily and not a drop of the medicine will be wasted.

It is doubtful if any feed will cause more rapid growth in colts than cow's milk from which the cream has been removed. Colts are easily taught to drink skim milk, and when one learned they will never refuse it as long as they live. Practical horsemen, however, are sometimes prejudiced against cow's milk as they believe it has a tendency to cause puffy joints and flabby musces.

Air and Light

It is as necessary that foals have an abundance of pure water as it is to feed them liberally. They should be watered at least three times every day and should be given plenty of time to drink. The stalls should be well ventilated and well lighted. The man who attemps to raise colts in a damp, dark stable will not find the business profitable. When it is possible to do so have the stalls on the south side o fthe building and furnish with glass windows that will admit sunlight, but so securely protected that the glass cannot be reached by the colts. Pure air is as essential to health as pure food, and sunlight is a valuable tonic.

All excrement, liquid and solid should e removed from the stalls morning, noon and night. To prevent offensive odors, sprinkle the floor occasionally with gypsum or air-slaked lime. It is also a god plan to spray the floors and walls occasionally.

OATS FOR COLTS

Those who raised an abundance of oats, cut the crop at the proper stage of ripeness, threshed under faorable conditions and stored the grain clean and dry are indeed fortunate. There is no better grain for ivestock than oats. They yield well as a rule, require little expense for production under anything like favorable conditions and animals relish the grain.

In comparison with any of the grain rations for both mature horses and colts. There is no other grain so safe to feed from and from which such satisfactory results are obtained. Livestock experts strongly advise however, that it is absolutely necessary that the oats be clean and entirely free from mold in order to obtain best results in feeding to colts. "Musty" oats are dangerous for colts.

A fair allowance of oats for colts after weaning is as follows:

Up to one year of age, from two to three pounds daily.

From one to two years, four to five pounds daily.

From two to three years, seven to eight pounds daily.

The best way to fed oats is in the whole grain, the expense of crushring not being justified unless colts suffer in teething, in which case it is advisable to feed steamed crushed oats, which are very nourishing and appetizing. It is always wise to feed plenty of roughage to growing colts. Feeding concentrated feeds in excess is discouraged, as it is important that the digestive trac be developed by distending it during the growing permay annoy the feeder, but this condition always disappears with maturity.

Proper feeding of colts should always be accompanied by plenty of outdoor exercise for the young animal. In no way can a colt be ruined so easily and surely as by liberal feeding and lack of xercise. Close confinemen and the raising of good colts do not go together.

WINTER CARE OF STALLIONS

The care of the stallion during the winter may make or mar his future. An astonishing large number of stallions die each winter, many being young, mostly between the ages of 5 and 10 years. This is much below the natural age limit. It may be true that they are contributing causes, yet we must recognize that faulty care and management are the most common causes of early death amongst stallions. Since improper care is causing many valuable stallions to meet an untimely death it is plain that a large number of others are being seriously and permanently injured by the same undesirable conditions.

Fortunate is the stallion that works every day. No other farm animal develops such a surplus of energy and there is no means so suitable for getting rid of that surplus as hard work in the collar. Every horesman knows of instance worked with results entirely satisfactory. Oftentimes two stallions are worked together as a two-horse team. The temperament of the stallion has much to do with the ease with which he may be worked. A bigger factor, however, is that he he put to work before he is spoiled by misuse. A draft stallion on a farm might well replace an animal in one of the farm teams during late summer, fall and winter and it will be infinitely better for him. Many men hesitate to put their stallions to work because it would be necesary to entrust them to unreliable hired help. There are often other reasons why it is impracticable or impossible to work the stallion. Nevertheless more and more stallions are going into harness and so increasing their value both to their owners and the comunity.

Exercise is an absolute necessity for the stallion. If he is not worked, then some means of allowing him to exerise must be provided. The value of any man's time is too great to allow him to exercise his stallion during the day by leading or riding. Practically the only thing left is to provide a large open pasture or paddock, the larger the better. The greater amount of freedom the stallion has the more heathy and rugged he will be.

I have seen on a ranch in Wyoming two large stallions running loose in the same 5 acre pasture. They played together as other stock might and frequently were seen chewing each other's shoulders, just as geldings do when turned out to pasture on Sunday morning.

One of the worst forms of treatment is to put the stalion into a dark box-stall and keep him closely confined without exercise and away from other horses. The famous Black Hole of Calcutta, into which prisoners were crowded to meet their death through suffocation, has its parallel in thedark and gloomy box-stall in which thousands of stallions meet death every year.

Stallion-owners and keepers who have marked success in wintering their animals give careful attention to feeding. They reduce the feed practically in half as soon as the season is over. If the stallion is not being worked he needs feed only for maintenance. A half ration of grain and half the usual amount of hay ordinarily is quite enough. With less feed the stallion will remain more healthy and rugged and will be less subject to ills of various sorts, some of which might lead to serious consequences. The plain farm feeds in a mixture will make a ration that he will elish most. Of ourse it is to be expected that all feeds will be of the best quality. Condition powders and condiments are not found in the barns of the most sucessful. Pure water is neessary in unlimited quantities. Salt must not be neglected. It may be supplied in a small box at the side of the stall where it may be reached at any time, or it may be fed in small amounts at frequent intervals.

Feet and limbs require careful attention. Clean stalls and plenty of fresh bedding re necesary if thrush and scratches are to be prevented. With these two troubles an ounce of prevention is worth a great deal more than the pound of cure. Many a good horse has been hastened to an untimely end by a case of scratches contracted in a stall that was not kept properly cleaned and disinfected. The horse that has a pasture of some size in which to run has a distinct advantage over his unfortunate brother

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY

For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Wood bury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

Advertise in the Farmer

CONSERVING THE TESTED SIRES

One should not be too hasty in parting with the old faithful improvers of the farm herd. A bull is not at the end of his usefuness when four years of age, nor is a ram or boar. Yet too frequently the sire of that age is sent to the shambles and a young succesor taken in that is in every respect an unknown quantity as regards his breeding ability. The only reasonable excuse for getting rid of a tried sire is that his female offspring are coming into the herd. But that is not sufficient reason in these times for butchering a four-year-old bull that cannot be replaccd except at a high price and possiby with results no less serious than inbreeding would produce. The dread of inbreeding is not as serious these days as it once was. Experienced breeders recognize that the mating of animas that are cosely related is largely a question of proper selection of matings. However, few men care to take any chances of reducing the size, constitutional vigor or quality of their animals by breeding a bull back to his own progency. But there is another plan that may be followed and the sires conserved. In almost every community there are two or more pure bred herds of the sahe breed, the sires of which may be exchanged when there is danger of inbreeding. The need of breeding animals is too great in these times to sacrifice good males in the fullness of their powers. A bull, properly used and not bad tempered, should be serviceable until the age of nine or ten years.

HIP LAMENESS

W. B. I.—Bought a horse last spring that was limping a litle on te right hind foot. I thought it would soon pass away, and let him stand in the barn for about ten days without geting any better. He got very lame. As soon as seeding was over, I blistered him for stifle joint lameness without any sucess. I then tried Absorbine, without help. It now appears that the lameness is in the hip. He canno move the lame foot forward the same as the other foot, and the parts from the tail to the point of the hip seem to be waning away, or is much lower than the other side."

Answer—Hip lameness in horses is about the worst kind of lameness to detect and cure. This is owing to the fact that the hip joint is what is known as a ball and socket joint and very deeply embedded in the tissues. We would advise you to procure at a drug store a blister composed of a dram each of biniodide of mercury and powdered cantharides, mixed with an ounce of lard or vaseline. In applynig the blister, clip the hair off around the hip joint and rub the blister well in over the region of the joint. Keep the horse's head tied so that he cannot reach the blistered part with his mouth. Leave the bister on for a couple of days and then wash off with soap and warm water, and appy a little lard to the blistered part every day until the scab loosens. Where the muscles of the hip appear shrunken you might rub the affected part with liniment composed of an ounce each of turpentine and ammonia to a pint of raw linseed oil. Rub a little of the liniment into the muscles every day as long as seems necessary. This horse, after being blistered, should be allowed six weeks' rest, and if lameness is still present setons or tapes should be inserted over the seat of the trouble. We should strongly advise you to carefully examine the hock joint of this horse, as your description o fhis walk is suggestive of hock lameness. If any doubt exists, give the hack a good blistering also.

CARING FOR HORSES' SHOULDERS

From the standpoint of utility in a work horse, the shoulder is one of the most important considerations. A good slope makes the best collar-bed. Straight shoulders with thick withers are most susceptible to injury. If the shoulder is straight, the force of the pull is thrown on the point and not evenly distributed.

A cheap, ill-fitting collar is a poor investment. The best way to secure a good fit is to take the horse to an expert harness-maker, where the proper size can be obtained, or measurements may be taken from which a collar can be made to order. If the horse has been idle through the winter and has taken on surplus flesh, allowance should be made for the size needed when the horse reaches its normal weight. When the collar is in the proper position there should be room to allow the hand to be laid between it and the withers.

Careful fitting of the collar may come to nothing if the hames do not fit properly. The top hamestrap, if rightly adjusted, will neither pinch the top of the neck nor be so loose as to allow rubbing. The lower hamestrap should be buckled tightly to insure a snug fit of the hames against the collar. If the tugs are properly adjusted the line of draft will be at right angles to the collar bed and the pull will be evenly distributed over the shoulder. This usually means that the tugs should be fastened at a point one-third of the distance from the point to the top of the shoulder. The traces should always be the same length; if not, there is a side pull on the shoulder.

Then if care is used in hardening the horse to the work, little trouble will result. Frequent stops are of advantage to the shoulder and an occasional lifting of the collar helps. Bathing the shoulder at night with cold water restores circulation and hardens the skin. By cleaning the collar each morning, a smooth surface is brought in contact with the shoulder and rubbing which might result in a breaking of the skin is avoided.

With the best of care, however, sore shoulders cannot always be avoided. As long as the swelling is well defined and movable, the skin alone has been damaged. This is best treated by carefully washing the surface. Some good shoulder washes are: (1) Alcohol, 1 pint, and the white of two eggs, thoroughly mixed. (2) A solution of silver nitrate, 10 grains to 1 ounce of water. (3) Carbolic acid, one pint in 15 parts of glycerine.

After the surface has been thoroughly cleansed, the wound should be powdered with iodoform mixed in flour or starch. In the case of a wound affecting the deep-lying tissues, the treatment is more involved and the injury much slower in healing. The wound must be kept thoroughly cleaned with an antiseptic and the horn-like substance removed. If the wound must be lanced, the skin should be spared transversely, but need not be spared longitudinally. The injured spot should be protected by means of a hole cut in a pad, if the horse must be worked.

OMAZON

is the great producer of vigorous stock, is a Canadian Food and a medicine excellent for horse, pigs and poultry. It gives endurance, increases appetite and gives vigor.
As a blood purifer and for increasing the quantity of milk in mare and cow it is highly recommended. It is economical. It saves grain. Mixed with other food it makes a big saving in feed expenses.

POULTRY.

DUCK RAISING

By VICTOR FORTIER, Poultry Division, Department of Agriculture.

Importance and Advantages.

The duck, a web-footed aquatic bird, similar to the goose but smaller, is one of the easiest and most profitable fowls to raise when suitable ground and sufficient water are at hand, and one which gives the choicest products. Water is an absolute necessity in duck raising. It is not essential that it should be running water or that there should be an abundance of it; it must, however, be renewed frequently so as to be kept relatively fresh and clean.

The successful duck raiser must have ingenuity, activity and experience and be a close observer. It is easy enough to indicate a general method of breeding and handling but climatic conditions, facilities, local resources, feeding and care, have such an influence on breeding that a method that might be excellent in one district might be a failure elsewhere.

The Plant

Duck raising does not require a very elaborate plant. A board shack, a shed covered with tar paper or straw, is quite sufficient for the ducklings in summer. The duck house should be built so as to avoid dampness, and the floor should be covered with a thick litter of straw or similar material which should be renewed frequently. For raising on a larger scale, a larger building is required; it should be well closed on three sides with movable sections and a wire door in front. In winter an ordinary hen house will do very well if it is well ventilated, well situated, dry and kept very clean. When there is no stream of water, pond or pool near by —for the use of the breeders—a small cement basin or reservoir or simply a zinc or galvanized iron box, which is kept filled with water, will do.

The Breed.

The choice of the breed is very important. Preference should be given to the breeds that are known to be of superior quality, as regards the quality of flesh, size, rapidity of development, etc., as such breeds are always the most profitable for the market or for home consumption. There is a large number of varieties of ducks which cost as much to raise or to care for as choice breeds and are not nearly so profitable.

The most popular breeds are the Pekin, the Rouen and the Aylesbury, all of which give a well flavored flesh. The Muscovy is very large in size with very fine coloring, the male of which, crossed with the common duck, gives a fine but sterile duck which is very popular for fattening purposes.

The average weight of these various breeds is from seven to ten pounds. They are hardy, early, good layers, large in size, with a very fine flesh of good flavour.

Next comes the Indian Runner, small, weighing not more than four to four pounds and a half, but very popular for the delicacy of its flesh, relative hardines sand laying qualities.

Laying and Incubation

The duck, with the exception of the Indian Runner, lays from 25 to 75 eggs in a year. Indian Runners frequently lay as many as the ordinary hen and may lay every month in the year. Usually the other ducks do not lay before spring. When they are at liberty to go where they please, they often hide their eggs in nests which are built outside the poultry yard. Therefore it is better to keep them closed in until after laying, which takes place during the forenoon.

One male is sufficient for from four to eight females. When there are too many males in a flock at mating time, they quarrel and the eggs are not properly fertilized. The eggs kept for incubation should be of average size and as fresh as possible. However, duck eggs keep their fertility longer than hen eggs. Eggs kept for incubation should receive special care; they should be kept in a cool place, on a layer of bran, sawdust or dry sand. As duck eggs are very susceptible to cold, they should be covered, if set under a hen, when she leaves her nest in quest of food.

The duck is a good sitter but is seldom used for this purpose. Preference is generally given to the hen, which takes very good care of the ducklings. Large hens should be selected fo rthe purpose. The hatching lasts from 26 to 29 days. Artificial incubation is generally used in commercial plants. It enables the breeder to have the ducklings ready for the market at an early date.

Care of Ducklings

When the ducklings are hatched, they should be left for ten hours or so under their mother or in the incubator; and should not have anything to eat for 24 to 48 hours. They may be allowed a little water and milk in a shallow pan to drink so that they may just dip their bill without wetting their bodies. If they should become wet they ought to be put near a fire, otherwise they become chilled and often die. The first feed should be a mash consisting of stale bread soaked in milk, hard boiled eggs, bran, green food, finely chopped. Curdled milk may be added. Later on, a fairly soft mash of corn flour, mixed with cooked potatoes will make an excellent meal. Such roots as carrots, turnips, cooked beets, may also be used. It is well to add a small quantity of animal food, blood, meat flour, butcher's scraps, etc.

The mash should not be too thin, otherwise it will cause diarrhoe. A small quantity of gravel or coarse sand should be added.

All cooked roots and tubers, lettuce, fish (in small quantity) given judiciously are all suitable for duck raising.

Cold and rain are very injurious. A duckling that has got wet by rain or otherwise in the first eight or ten days of his life is in great danger of dying. He drowns quickly in little water. Do not leave wet ducklings in the sun for the purpose of drying them, they might get sunstruck and die. Do not let them take a bath until 8 or ten days after birth, and then only for a very short while and if for market they are better kept from swimming at all.

If no running water is available or if there is no pool big enough so that they can swim freely, a tank should be set up with a sloping board at both ends so that the ducklings may easily go up or come down.

When the duckling is a month old if for stock purposes, it may be given its entire freedom if there is a stream in proximity. All it requires is a meal at noon and one at night. Ducklings well fed, in regularly increasing rations, are ready to market at two or three months old.

Ducklings that are reserved for breeding purposes should be selected among the most thrifty specimens and from an early hatching.

Rations

Ration for one month old ducklings —Bran 2 parts, cornmeal 2 parts, shorts 2 parts, beefscraps ½ part, gravel, crushed oyster shells or saud 3 per cent. mixed with milk or water, feed them all they will clean up three times a day.

A ration for one duck.—Morning: Cooked potatoes or roots, 2 ounces; meal, ½ ounce; meat or fish scrap, ½ ounce; fireen food, 3½ ounces; gravel, crushed oyster shells or sand, 3 per cent., to be mixed with milk, 3 per cent., to be mixed with milk. Evening: Cooked grain, 1¾ ounces.

Fattening

Fattening may be started as soon as the ducks are eight weeks old. They are fattened in a yard or pen. They should be isolated as much as possible, in a dark building well ventilated and provided with a good litter, always kept very clean. The food should consist of mash mixed with milk, rather thin, and composed of cooked potatoes mixed with corn meal, barley meal, shorts, beets, cooked carrots, and green feed. Ducks are ready to kill when they move around lazily and when they refuse their feed. As a rule it will take about two weeks to finish them.

It is recommended to let the ducks take a bath so that they may be clean themselves, and to starve them at least 24 hours before killing. Ducks are killed in two ways: (1) by disjointing the vertebrae of the neck; (2) by bleeding, which is done by cutting the veins in the roof of the mouth. They should be chilled before packing.

Diseases

Ducks are subject to only a small number of diseases, which is an important point in favor of this industry.

Constipation

Caused in the majority of cases by exclusive or too long feeding on grain. It is recommended to give a purgative composed of two or three grams of sulphate of soda in a large spoonful of water.

Cramps

Cramps is a sign of anaemia and weakness. The duck is unable to stand and shows symptoms of diarrhoea. The sick birds should be isolated. Quinine and gentian powder should be added to the ration at the rate of one teaspoonful per day for every ten ducklings one month old; a larger dose for older birds. Also put three grams of iron sulphate for every quart of drinking water.

Diarrhoea

Caused chiefly by wet green feed and sometimes by worms. In the latter case, it may be cured by an ordinary vermifuge, such as gentian, tansy, which is added to the drinking water with a little charcoal power.

Diphtheria

The duck keeps its bill open for breathing. Put in the mash, per duck and per day during eight days: Iodine, 5 drope; flour of sulphur, one pinch.

Mosquitoes.

To keep away mosquitoes, which greatly inconvenience ducklings at times, the ducks may be rubbed lightly two or three times a week with lard and kerosene or lard with a small quantity of carbolic acid.

Rheumatism

Generally caused by exposure to cold. The duck walks with difficulty. Keep the duck in a warm place, rub the limbs with a little oil of turpentine, feed well and put bicarbonate of soda in drinking water (5 grams of bicarbonate for every quart of drinking water).

Vertigo

This is a fairly common disease, generally caused by long exposure to the sun. The duck turns round on himself almost continually, he appears to be drunk.

This disease may sometimes be cured when it is taken in the proper time; bleed the bird at the vein under the wing or the membrane of the toes. If this treatment does not succeed, it is better to kill the bird, which is still very good for eating.

PREPARE THE EGG LAYER FOR WINTER PRODUCTION WHEN PRICES GO SKY HIGH

We are told that "eggs are going sky-high" before long. And while this may be somewhat exaggerated, yet we have to admit that prices are on the upward trend. Not only egg prices, but grain prices and, in fact, prices of nearly everything else.

A good many poultry keepers are asking themselves the question: "Will it pay to keep hens for winter eggs and feed high-priced grain?"

The above question must be answered by the individual himself, or by someone who understands local conditions. But so far as we are concerned, there is no question as to whether it will pay or not. We know by long experience that winter eggs are profitable and with ordinary success we still hope to come oue "ahead of the game."

Plenty of Feed Essential for Winter Production

There is no magic in getting eggs in winter. But a good many things must be considered. To begin with, it is essential that the fowls kept be healthy and of suitable age, i. e., neither too old nor too young. Old hens, as a rule, put on flesh instead of laying eggs, while small, late hatched pullets or those that were stunted in growth, will lay no eggs during the winter months.

PEERLESS PERFECTION
The Fence For Real Protection
gives life time service. Is made of the best Open Hearth steel fence wire, all impurities burned out, all the strength and toughness left in. Makes the fence elastic and springy. Will not snap or break under sudden shocks or quick atmospheric changes. Galvanized to prevent rust and the coating will not flake, peel or chip off. Can be erected over the most hilly and uneven ground, without buckling, snapping or kinking. Every joint is locked together with the well-known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences. Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

Children Like It

It is not an easy matter to get a medicine that children like, or to force them to take one they don't like. Most mothers know that a cough medicine, while palatable, should contain no drug injurious to the child. The great popularity of

Chamberlain's Cough Remedy

is explained by the fact that it contains no opium or narcotic of any kind, and at the same time is so pleasant and agreeable to the taste that children like it. For this reason it is a favorite with the mothers of young children.

Yours for health,

—Granny Chamberlain.

28

Keep Pullets Separate

Don't let the young pullets roost in the same house where the hens are kept, until they get used to the rest of the flock. There are always some backward pullets that cannot "hold their own" with the older birds. For these, we have a house and yard where they are kept for a few weeks, separate from the others. Of course, they must have good care and plenty of feed.

Remember, these so-called backward pullets are not the culls, but good thrifty pullets which seem rather timid and, for some reason, are unable to get their full share of feed. A variety of grains and other things are necessary. Practically the same ration is required for growing pullets as that which is necessary for laying hens.

Also, moulting hens. The latter require a liberal ration. Plenty of feed and good, dry roosting quarters should be provided if the hens are expected to come through the moult and be ready for business, before cold weather sets in.

Buttermilk Valuable for Egg Production

Buttermilk is very beneficial, both as an egg producer and growth promoter. It also helps the moulting hens to grow feathers. Bear in mind that the latter are under a strain so to speak. Their vitality is beink taxed to the limit. The late moulter is very frequently a heavy layer and while she is growing a new coat of feathers, she is, at the same time, laying up egg material for the future. We keep some milk before the fowls most of the time, but sweet-milk should never be used because it takes a bad effect on the bowels. Be careful to keep the milk trough as clean as possible.

There is doubtless a great deal of soft corn in many parts of the country at this time. Be careful about feeding this immature grain to poultry. New corn, at best, is none too safe. In former years we have suffered severe loss by feeding poultry new corn, especially turkeys. If new soft corn must be used, we now boil it.

This same rule holds good with other things such as musty grain, cull beans, etc. If any of these are not too badly spoiled, they may be made suitable for poultry feed by thorough cooking. This sort of feed can be used as a mash by adding bran or something similar. Right here we want to speak a word of caution in regard to the use of crushed corn. When the cob is crushed with the corn it should not be used as a poultry food. The crushed cob is practically indigestible, somewhat similar to sawdust. We have known of a number of cases where poultry have died from eating "cob meal." They simply cannot see the difference between cob meal and corn meal.

A Wheatless Ration

While wheat is one of the best egg-producers known, when fed along with corn, we have cut it out of the ration entirely, on account of the cost. Instead, we use bran and boiled oats. Thus, with a little corn meal added, makes an excellent mash. Sometimes we use boiled vegetabls Somtimes we use boiled vegetables, instead of oats.

When the hens are kept housed, as they must be, when the weather is severe or snow is deep, it is essential to vary their ration. We sometimes add raw cabbage (chopped) to the mash. A little salt or a dash of cayenne pepper helps to give it a "tang" that is greatly relished. Green stuff, or a substitute for same should be provided. Pure water, with the chill removed, should be kept within reach.

Don't fail to provide some sort of place where the hens can get all the exercise they need. We have regular scratch-sheds attached to each house, but in former years the floor of the poultry house answered very well.

Every fall when dry leaves are plentiful, we store large quantities to be used as scratch material. Rye in the sheaf, or other unthreshed grains are used, also. Small grain, such as kaffir or even millet, will answer to make the hens work, but will not take the place of corn.

Fall Feeding Important

Sharp grit is an important factor. Again let us impress upon the minds of beginners the importance of a generous ration, right now, for both old and young. Don't wait until winter to begin feeding fo reggs. The fact is, chickens are more often under-fed than over-fed, at this season of the year. If judgment is used in the selection of feeds, it is next to impossible to over-feed a moulting hen or a growing pullet.

As to hopper feeding, don't do it unless the fowls have been accustomed to it, from the time they were hatched. Otherwise, they seldom know when to stop eating.

A warm mash in the morning, with scratch-feed and "grains" through the day and a full feed of warmed corn at night (never feed frozen corn) will give better results as a rule. We usually allow one quart of shelled corn for every ten fowls. A large handful for each hen is a safe rule, but may be varied.

ANNA W. GALLAGHER.

NOTICE TO FARMERS

Cards requesting information about seed will be distributed in a few days by the school teachers. These cards are for information only and no person is bound in any way by them. Every man receiving one is requested to fill it out immediately and return to the teacher.

If any do not receive cards, state seed requiremnts for 1918 to the Secretary of an Agricultural Society or to the N. B. Department of Agriculture, Fredericton.

POULTRY HOUSE DISINFECTION A DESIRABLE STEP

The principal factor in the eradication of poultry diseases is the adoption of proper sanitary measures at the outset. Infectious disorders will recur, no matter how wisely treated, unless such treatment is supplemented by the liberal use of efficient disinfectants. Disinfection is the one basic principle upon which rests freedom from disease and prevention must occupy the foremost place if headway is to be gained.

The proper method of disinfecting fowl houses is as follows:

Remve all litter from the floor and nesting places and burn as near the building as convenient to avoid contamination of the surrounding soil. If possible remove nests, roosts and other portable fixtures and place in the sunlight. Empty all hoppers, feed bins, etc., of dry mash and other grain and discard grit or scald with boiling water before using time. Scald all utensils, pans, etc. If cotton fronts are used, these should be removed and either washed thoroughly or scalded with boiling water. The windows should be taken out and washed with warm water and soap, the frames being well scrubbed with a hard brush. If straw lofts are used, the straw should be removed and burned with the litter. The inside should then be thoroughly swept down to remove cobwebs, dust accumulations, etc., or if possible, flushed out with a good hose. All accumulations of hard droppings should be loosened by softening with water and then scraped clean with a hoe or other sharp instrument. Disinfection may now be commenced. Mixed fifty pounds of unslaked or quick-lime in a barrel of water and add to this one gallon of good commercial disinfectant. If a smaller amount is required it may be made by adding two and one-half pounds of quick-lime to a pail of water plus half a teacupful of disinfectant. Be sure that the lime is not slaked by exposure to the air as all its disinfecting power is therebf lost. The easiest method of applying the lime-wash is by mean s of a spray-pump which can be purchased at a reasonable cost and can be used to advantage in other buildings. Before using the lime solution it is advisable to strain it through a fairly fine sieve or cheese-cloth as the filter is liable to become clogged. In the absence of a spray-pump, a whitewash brush may be used although it is difficult to fill the cracks and crevices without a stream to drive in the solution. These cracks serve as breeding places for mites, lice, etc., and should be given careful attention. Where an infectious disease, such as tuberculosis, has been present, it is wise to spray the interior at least twice with an interval of one week between each application. Otherwise one good treatment will be sufficient. The runs, if not too large, should be covered with a thin coating of air-slaked lime and then spaded or ploughed to a good depth. If lime is not available, a thorough spading may be sufficient although less ecective than the former method. The runs should be changed each year if possible or divided up, one-half being sown to rape or other green crop This cropping destroys the breeding places of worms, etc. If portable houses are used, they should be moved frequently as feeding fowls and chicks on the same ground year after year, serves to infect them with numerous diseases. Allow the fowls open range is such : av-ailable.

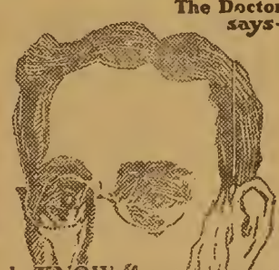
You Want Your Dairy Bright and Sanitary
Keeping things clean makes them work better and last longer.
Then use Old Dutch and save time and money.
Old Dutch Cleanser
Chases Dirt

Disinfect in the spring and fall if possible and by all means in the fall before introducing fresh stock into the fowl houses.

A GOOD LICE KILLER

According to Farmers' Bulletin No. 801 sodium fluorid powder is death on poultry lire. It can be dusted into the feathers so it will reach the skin. It should be applied to all parts of the body. It can be made into a solution one ounce per gallon of water and stir well. Dip the poultry into it. The dipping method kills the lice quicker, better and more cheaply. The sodium fluorid has no bad effects on the skin but is a little irritating to the air passages. It is however, very destructive to the lice.

The Doctor says—



I KNOW from years of experience that Wilson's Invalids' Port is a tonic of great merit, prepared with Cinchona according to the British Pharmacopœia.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

A CHEERFUL RECEIVER

An Object-Lesson Christmas Story

Told by Ethel Chapman Haring

Giving always came easy to me. I'd rather sit hungry with my soul all swelled up wtih the pleasure of giving away my supper than eat the best meal in Ellenville. And my appetite's middling, too. It was part my disposition, and half the way I came up.

You see, I'd just turned up my braids and let my skirts down to my shoe tops when father died, and before my heart had done ashing mother followed him. Then the mine petered out—the one that had kept up going ever since father's fall in the mill—and there I was, all alone, with just the house, besides a little income from railroad stock. All Ellenville believed in that stock as they believed in gospel and government, but 'twasn't near enough for me to live on. That is, if I kept the house. And I was set on that.

Well, I'd always been fond of needlework, so I put my hair in a pug, let my skirts down to the ground, sent old Jemima to the son who'd been wanting her for years, and started to sew for a living. There were Granny Grunts a-plenty, but mostly folks sympathized with me wanting to keep the house. And besides, I was a good seamstress.

After a few years I got to be a good dressmaker—for Ellenville. I could give to the church and the village improvement society, and do a little for those shiftless Cummingses over Jones's Creek way, and old Dosia down the lane—I suppose her name was Theodosia. Every year I got more independent. And independence is giddier than hard cider.

The summer I was twenty-four Tom Betterly began to keep company with me. He wasn't earning much in his father's hardware store, but he had an interest in the business, and he was likely and clean and strong. There wasn't a girl in Ellenville who wouldn't have been proud to have him pay her attention.

I was. But in those days the only way I knew to show it, was to do things for him. I wore my eyes out making him shirts by hand—nights, after I'd been sewing all day. When we went on little ercursions I wanted to pay my half—I had more than he did, anyway. He always made a fuss about it, but I knew he'd save what he didn't spend, and, you see, for eight years I hadn't had any practice cutting my ideas by someone else's pattern.

Well, along Thanksgiving time Tom got restless. Once in a while he'd stay away on his regular evenings, and not give me any reason, and I'd sit at home working on Christmas things for him and my poor people, and pretend that the bottom hadn't dropped out of everything. The next time he came I'd be too proud to ask questions. But dressmaking the way I was, it wasn't long before I found out. He was calling on Lucy Spire.

I was struck all of a heap! Why, she wasn't even pretty, except in a skim-milk sort of way, and no more fit for a poor man's wife than a sleazy chiffon's fit for a pair of overalls. How I suffered those weeks! A man who had a fine chance to find out, called jealousy cruel as the grave. It is the grave—of happiness and charity and peace.

Christmas coming, too! And I had two dresses to finish for Mattie Blake, who was almost engaged to a man who was to visit her brother over the holidays, and a nun's veiling for Mrs. Sprowles—her four girls were all coming home with their families, and she wanted to show them that she wasn't a back number, even if she did live in Ellenville, and was nine times a grandmother. It kept me stitching till all hours, and I had my poor people to do for after that, so I didn't have much time to worry about Tom.

On Christmas eve I put the last tired stitches into Dosia's wadded packet. It was grey flannel lined with sheet wadding—warm and serviceable, just the thing to keep the rheumatism out of her grumbling old joints.

At eight o'clock Tom hadn't come. His folks had invited me for Christmas dinner, but I thought he might drop in for a little celebration by ourselves. When he didn't I knew that able. —i wm TfiY vbgkq cmfwy shrd was the end. It was a mighty miserable Samaritan who started for the lane with Dosia's jacket under one arm and a basket of groceries and underwear for the Cummingses on the other.

The lane was out at the north end of Ellenville, where most of the ragtag and bob-tail of the town lived—a long, nipping walk from the hill. The moon was cold and unfriendly, and the stars sharp as steel points; my fingers ached and my ankles kept turning with a jerk on the frozen, nubby road. Once in a while the tears would come—because I was tired out, I told myself—but it was a scrap of comfort that somebody needed me, if Tom didn't.

I left my basket at the Cummingses first. All the youngsters swarmed to the door, and their poor worn-out mother—she wasn't much older than I was—asked me in, real craving, but I was too wretched to be sociable.

There was a faint light in Dosia's box of a shanty, that some good-natured men had built in a woodsy lane on the edge of town, to keep her out of the poor house. The bent old creature opened the door and peered out at me from the shadow of the red knitted hood she always wore. I was glad she couldn't see my eyes.

"Why, bless my stars and garters, come in!" she cried, blinking and throwing up her palsied old hand. "'Tis you, after all. But I might 'a' know you'd be sure to come. Set, won't you?"

"Thank you, Dosia." I shut the door after me and held out the bundle with a poor excuse for a smile. "But if I hadn't wanted to bring this to you, I shouldn't have stirred out tonight. What with sewing and Christmas work, I'm clean tuckered out. I hope the present'll keep you nice and warm."

Dosia took the package and fumbled with the string. "I was hoping you'd stay," she said, sort of resigned. "But I s'pose folks that don't have nothin' to do can't expect busy ones to waste their time—after all the hours you put on this present, too. My, but it's handsome—and how nice it's finished! I used to do fine feather stitchin' and herrin' bonin' afore my eyes give out. The material's real heavy, too—almost like some I remember mother buyin' at your Grandfather Bassett's store. I'll admire to wear it. You're awfully good to a useless old woman."

Dosia could run on at the fearfullest rate—not having any one to talk to generally, she had to make the most of her chances. I saw I'd be spending the eveing if I didn't cut her short, so I said:

"I enjoyed making it for you, Doshy. Merry Christmas!" and was turning to go, when somebody knocked.

"Oh, Doshy!" I whispered, "you're going to have another caller, and I'm too tired to see anybody. Can't I run into the lean-to until they're gone? Please!" and I tiptoed into the woodshed at the back.

She was dreadfully flustered, but she managed to let the visitor in. And who do you think it was? Lucy Spire, the girl I thought was entertaining Tom up on the hill! The minute she stepped inside she put her arm round Dosia's crooked old shoulders and kissed her withered cheek. Lucy wasn't a bit the get-up-and-get kind, but she had lots of brown hair done in a droopy twist, and her drawly voice had a pleasant, comfortable sound.

Christmas gift, Miss Dosia! Why, I b'lieve you don't know what that means! Easy to see you weren't fetched up in the south." She held Dosia's hand all the time. "It means I want you to make me a present."

I blushed for a well-off girl like her making Christmas an excuse to beg from that poor woman!

"It's a long time since I made a present," said Dosia, as if the words came hard. "I don't know as I've got a thing you'd want."

"Why, Miss Dosia, what you talking about? You've forgotten that lovely bunch of rose pineys you gave me last spring! I never shall. And those geranium slips—why, I set out 'most one whole bed from those slips! And I know you've got this, but it's such a big thing I'm almost afraid to ask." She looked real shy and persuading.

"I'm sure if I've got it, it's yours for the taking." Dosia was all excited.

"Goody! Lucy squeezed the old woman again. "It's one of those dear little baby evergreens in your back yard—for a table tree, you know. The boys have looked all through the woods, but there aren't any as straight and full as those of yours. They would have asked you themselves, but I was afraid my big brothers would frighten you. They're waiting for me up the road. May I have one?"

Old Dosia began to cry. "Take 'em all. I don't want 'em. I don't want anything as much as I want to give somebody something. 'Course we poor folks 've got to be guv to or we'd freeze or starve, but we've got to give, too, or there ain't much use livin'. It's dreadfully hard not to have anything anybody wants—specially Christmas. My, it's like old times mhen I could be free-handed, too."

Lucy held her tight—I couldn't hear what she said—maybe she didn't say anything—but she just petted her and crooned over her as if she'd been a baby. Finally Dosia said:

"Well, I s'pose we mustn't keep the boys standing in the cold on Christmas eve. Besides, I just can't wait to have you take that tree!"

"Ah, thank you! I knew you were a giving sort of person. One of the boys brought a hatchet. Goodnight—I hope somebody'll give you a present you want as much as I do this!"

"I got my present," Dosia quavered. And I knew she didn't mean mine.

A minute after, there were voices and the blows of an ax—then shouts of "Merry Christmas," as they passed the house. Dosia looned out and waved.

She had forgotten all about me, so I clicked the latch before I came into the room.

"Doshy," I said—and I didn't need to put on the shivers—"I'm a mite cold waiting out in the lean-to. Could you make me a cup of tea before I go?"

She gave a little jump and bustled over to the rusty old stove as if there wasn't such a created thing as rheumatism.

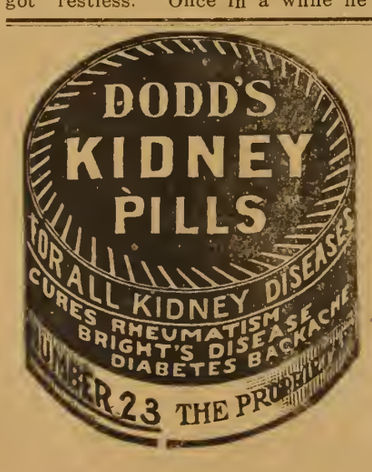
"My suz, I should think I could. Will you stay? Tea's one thing I allus keep by me. Set down, do, and be as comfortable as you can," and she pushed me toward the only rocker, a crazy thing with spread legs.

Well, in two shakes of a lamb's tail we were cozy, and I was telling her about Mrs. Babbitt's new high-heeled, low-necked daughter-ni-law from Drayton, and how the minister had scolded the choir for giggling when one of the Cummingses forty'leven dogs sneaked into church last Sunday.

She looked real happy when she talked to me about the time when my grandmother and she had been girls together. I'll warrant she was a keen one in her time. She told me about Grandfather Bassett, who died before I was born. I must have favored him, for she said Lucifer was a meek and brow-beaten citizen side o' Eben Bassett.

When her wheezy old clock snarled ten, I could hardly believe how long I'd stayed, and I told her so. "But there's one more thing I wish you'd give me, Doshy—a twig off your balsom fir for a Christmas tree."

"Pull it up by the roots, if you're a mind to. I don't want it. Ner nothin' mor 'n I've had tonight. Tears stood in her filmy eyes. "You've allus been



LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

HAD A VERY BAD COLD and COUGH

DR. WOOD'S NORWAY PINE SYRUP CURED HER.

Mrs. C. Dresser, Bayfield, Ont., writes:—"I want to tell you of the benefit I got from your medicine.

Last winter I had a very bad cold and cough, but after taking two bottles of Dr. Wood's Norway Pine Syrup I was cured. I think it is about one of the best cough syrups that I know of. I always keep a bottle of it in the house so I can have it when I want it.

The other week I told an old lady about "Dr. Wood's." She had been sick for three weeks with bronchitis, and had been getting medicine from the doctor, but did not seem to be getting much better. She got one bottle of Dr. Wood's Norway Pine Syrup, and she says it has done her more good than all the doctor's medicine she had been taking."

Dr. Wood's Norway Pine Syrup is rich in the lung healing virtues of the Norway pine tree, and this makes it the best remedy for coughs and colds.

The genuine is put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

good to me—why, I've got those foot warmers yet you made me when you was a slip of a girl—but I never felt really drawed to you till now."

I broke off a twig of the balsam; I forgot all about being cold. All the way home I saw how Tom must have felt, just like Dosia—noly worse, being a man and made to be depended on. And when I got home, the first thing I did was to whip those handmade shirts and hemstitched handkerchiefs into great-grandfather's sea chest, and stick the bare twig into a flower pot.

Bright and early next day I was up and doing. Things were going to look Christmasy if my heart was one big ache. I piled the wood into the baseburner, and tied red paper petticoats on all the flower pots. But before I'd half finished looping the ground pine over the pictures, I heard a man's tread across the porch, and when I answered the big knock Tom stepped into the living room. He looked a little worried—I knew he dreaded the presents he was going to get—but he was there. That was all I cared. In my relief I couldn't speak.

"I came as soon as breakfast was over," he said, taking off his overcoat. "Mighty sorry not to get down last night, but mother wanted a lot of help tacking up greens, and we had a busy day at the store. My, how fine you look!—regular holly bush in that green and red rig. Sure you didn't strain yourself bringing in the Christmas tree?" He smiled a sober sort of smile.

"The tree's plenty big for what I'm going to put on it," I began slow and awkward; then I let go: "Oh, Tom!" I cried, "I'm not going to give you any present. I couldn't think of a thing that wasn't small and mean compared with what you've given me —what you're giving me every day—friendship and love and the hope of a real home."

His eyes shone: He took both my hands in his. "Thank heaven, girl, if that's so. I've been afraid—"

"You needn't ever be, again," I told him. "I'm not going to be afraid, either—of anything. But I should like to know this: Why did you like Lucy Spire so well? Please—just to satisfy my want-to-know-itiveness. Honestly, Tom, I'm not the least bit jealous."

He blushed a little, but his honest look didn't change.

"You needn't be jealous of any girl in the world, Hattie. But to tell the truth, sometimes when you seemed so comfortably fixed and so sure of yourself, Lucy was a change. She has such a graceful sort of way of making a fellow feel—well, more of a man, to be looked to and depended on. But jealous! Why, she can't hold a candle to you."

"I guess any candle she'd hold would shed quite a bit of light on some of my ways of doing things," I said. "But I just couldn't get along without you now, even for Lucy."

"You won't have to, girl; you won't have to."

He kissed me solemnly to seal the promise. And right then and there I learned how blessed it was to be a cheerful receiver.

How Gold Dust saves housekeeping time

Here is an easy way to prove that Gold Dust saves housekeeping time.

The next time you wash dishes try Gold Dust. See if it doesn't dissolve the grease quicker than soap. When you get through, see if you can't honestly say to yourself, "I've saved some *real* time."

But don't let Gold Dust stop at dishwashing. Use Gold Dust in all kinds of household cleaning—such as scrubbing the kitchen floor, washing woodwork or cleaning the bath-room.

But for Gold Dust results be sure you really get Gold Dust. For sale everywhere in large and small packages.

LABOR SAVING APPLIANCES IN THE FARM HOME

The conservation of our various resources is being discussed from many viewpoints. None of these resources is of greater importance than the strength of the farmer's wife, a fact which apparently has not been generally realized. History has ever shown, not only that a constant stream of vigorous new blood flows from the farm to keep up the waning vitality of the city, but also that from it come most of the men and women who lead the progress of the world. This granted then, anything that will lighten labor in this home or conserve the strength and youth of the wife and mother is cheap at any cost. Did any one ever see a farmer's wife sucering from lack of exrcise? No, but she is often so exhausted by doing her work that seh has neither time nor energy for the higher duties of mother, for self-improvement or for the rational enjoyment of leisure, and in the face fo this there are now many labor-saving appliances procurable at reasonable cost, and in these modern times just as applicable in the country home as the city dwelling. Owing to the scarcity of farm help there has been a remarkable development in the use of hydro-electric energy on many farms, and electricity can now be had in the home of the average successful farmer. This system has the advantage of the adaptability to run many appliances, the sewing machine, separator, churn and washing machine, in addition to lighting the home. Perfect sanitary conditions are certainly among the practical requirements of a modern home which received but scant attention a few yeasr ago. What can possibly be more practical than careful heating, ventilating, plumbing and lighting of a home when it means a constant contribution to health and physical comfort and extends the lease of life. Light, heat and water systems change a mere house into a cosy home.

The kitchen is the main workshop in the home and it cannot be made too handy. The water supply to the kitchen is of very great importance and the modern cistern located in the cellar is proving a boon to many a farmer's wife today, and with this installation the laundry can be provided for adequately in the basement. Water can be piped from the cistern to the laundry, and the usual drudge of carrying water for pumping purposes can thus be done away with. The sink is of double value when provided with a sink drain, and this is easily arranged. The refrigerator is to-day playing an increasingly important part in the economy of the well equipped home. A flour chest is important. Better than the common tilting box is one running on rollers on the floor, with a kneading board sliding in a groove above. Still better is a flour chest in the upper cupboard, filled from the second storey, and having a hopper-shaped bottom terminating in a patent sifter and drop down for use. The kitchen cabinet, improved washer and wringer, measuring cups, graduated spoon sets for cake and pie measuring, improved cake pans, roasters for the ovens, fruit strainers, food grinders, chopping knives and kitchen cleavers for preparing meats, all help out in the busy seasons of cooking, canning and baking. The suction vacuum cleaner and brush sweeper combined make an ideal sweeping day companion, removing as it does the dust not only from the carpet but from the floor beneath, thus eliminating the real cause for germ and disease germs. The O-Cedar mop is another equipment which will save the housewife much unnccessary scrubbing of linoleum and oiled floors, with all the kneeling and "getting up and down" attendant upon the old-time hand-cleaning of floors. The folding rack ironing board, which attaches to the wall, is another convenience worthy of note. The pulley clothes line is a very desirable improvement upon the old method, removing all necessity of standing out in inclement weather on damp ground.

The practical requirements of the modern home consist of every known convenience, too numerous to mention here, but a visit to any up-to-date hardware, commercial store or show roo mwhere electric appliances are displayed would convince the housewife that no line of work in connection with house-keeping or homemaking has been forgotten in modern invention. Work in the up-to-date equipped home is but mere play in comparison with the toilsome duties of former years.

INSTITUTE NOTES OF INTEREST FROM NEW BRUNSWICK

Albert—The young ladies of the village gave half the proceeds of their Hallowe'en Entertainment, $25.70 to the Institute. The members are busily engaged in making sleeveless sweaters for the soldiers.

Bath—This new branch is taking a special interest in the school and several improvements have been recommended to the school board which, if not carried out by the board, will be undertaken by the Institute.

Boiestown—A house to house canvass for new members added 17 new names in October to the list of paid members.

Campbellton—The Tea given in St. Andrews Hall last month by the W. I. in aid of the Great War Veterans' Association of Richibucto was a grand success. The hall, with its prettily appointed tables made the place very inviting, and the patronage extended was a generous one. The net proceeds amountd to $130.83 and after deducting expenses the Institute gave the boys $100.00, which will go towards furnishing their rooms on Water Street.

Centre Napan—The September meeting was especially for parents and children. Mrs. W. C. Galloway read a very helpful paper entitled, "How to Teach Children Economy." Twenty-five children were present to hear Mrs. Galloway's practical suggestions. This branch has prepared a printed programme for several months in advance. Each month contains not more than one subject so that if an additional number is wanted to be included at any meeting, this can be done.

Chance Harbor—Probably encouraged by the prizes the Department is offering for best average attendanse and rarefully prepared programmes for the first six months in 1918, this branrh for the first time since the war began, is preparing a variety programme with a view to winning a prize.

Chipman—Two or three excellent papers prepared by members of this branch have been forwardd to the Department. Especially worthy of mention are "Parliamentary Procedure" and "Banking for Women." "Do your bit" is the motto adopted by the Institute. From a donation received, a drinking fountain and individual drinking cups are being purchased for the school.

Codys—Thanksgiving quotations were given in response to roll call at the November meeting and the girls furnished the programme with thanksgiving readings and recitations.

Corn Hill—The annual social meeting with the "gentlemen" as "guests" was held in November. A very enjoyable social time was held. On October 29th the Pie Social netted $34.00 towards filling Christmas boxes for the soldiers.

A Merry Christmas and a Happy New Year to All

Moncton Business College, Moncton, N. B.

Dalhousie Junction—"How to get money for helping in Patriotic Work" was given earnest consideration at the July meeting. With a small and scattered membership it was somewhat of a problem after other devices had been about exhausted. The unique method arrived at and since carried out is very worthy of mention. The Institute members have agreed to help one another in any way required, such as washing, housecleaning, sewing, mending, etc. In return for such help the members are to pay one another the same wage that would be paid to the regular or professional working woman. The money so earned is then handed in to the Institute to be used as may be needed. The secretary writes, "We find it quite successful. For instance, I have found it inconvenient to have to get a woman to come some distance to do my washing and other heavy work. One of my neighbors now gives me a day when she can and receives the money which otherwise I would pay the regular working woman. On the other hand, I can do some kinds of sewing, darning, etc., rather well and now instead of doing an invisible darn in my friends' frocks for love, I do it for money and give the money to a good cause."

Grand Falls—The members are making a thorough canvass of the surrounding country in the interests of the soldiers yarn fund. Fifty-five Christmas boxes were shipped overseas in November.

Fredericton Junction—This branch is presenting the Children's Home with quilts and is also giving a supply of clothing to a family in distress in their community.

Hillsboro—The Sock Social held in October was a great success. After all expenses were paid there was a balance of $93.00 on hand for patriotic work.

Kennebecasis Valley—The following resolution passed at the November meetini, reads: "For refreshments at Institute meetings there will be no frostings on cakes." A number of members brought to this meeting useful and dainty Christmas gifts costing not more than twenty-five cents. A Bean Supper in October netted $30.00 for patriotic work. This branch continues to hold a Guessing Contest at each meeting and the receipts from same help along the good work being done for the soldiers.

Havelock—A reception was held for a returned hero in October. The ladies prepared the supper, engaged a man to do the serving and left the entertainment wholly to the gentlemen of the place. No ladies present, but about 75 men. This was a complete success. Corporal Keith was presented with a signet ring. The Department is greatly pleased to note that this branch invested in a Victory Loan Bond.

Jeffries Corner and Poodiac—The proceeds from the Basket Social held October 31st, together with the money raised from selling candy at this social, will be spent on school improvements. This branch has also purchased dishes and silver for Institute entertainments.

Lord's Cove—Here is enthusiasm for you. One of the members of the branch made a percale quilt and gave it to the Institute. She has sold 100 tickets so far and ha 150 yet to dispose of, but is quite cheerful that she will be able to do so, and rlear at least $30.00 for the Institute.

Marysvile—Prior to the Canning Exhibit at the Convention, this branrh had an exhibit of their own and awarded prizes. The jars of fruit and vegetables were placed on exhibition in one of the store windows and were greatly admired. The proceeds of a Fall Supper netted $90.00 to be spent on the soldiers.

Minto—The sum of $124.61 was cleared from a picnic held in September. During the past year this branch has raised over $700.00 and with this money a hall is being built in the community.

Nelson—The Birthday Party in

Final Appeal Judge Gives Ruling on Exemption of Farmers

Mr. Justice Duff (the Final Court of Appeal) Declares it is Essential that there shall be No Diminution in Agricultural Production.

(Published by authority of Director of Public Information, Ottawa.)

Hon. Mr. Justice Duff gave judgment on December 6th, in the first test case brought before him, as Central Appeal Judge (the final court of appeal), for the exemption of a farmer. The appeal was made by W. H. Rowntree in respect of his son, W. J. Rowntree, from the decision of Local Tribunal, Ontario, No. 421, which refused a claim for exemption. The son was stated to be an experienced farm hand, who had been working on the farm continuously for the past seven years, and ever since leaving school. He lives and works with his father, who owns a farm of 150 acres near Weston, Ontario. With the exception of a younger brother, he is the only male help of the father on the farm. The father is a man of advanced years.

In granting the man exemption "until he ceases to be employed in agricultural labor," Mr. Justice Duff said:

"The Military Service Act does not deal with the subject of the exemption of persons engaged in the agricultural industry; and the question which it is my duty to decide is whether the applicant being and having been, as above mentioned, habitually and effectively engaged in agriculture and in labor essential to the carrying on of agricultural production, ought to be exempted under the provisions of the Military Service Act.

"These two propositions are indisputable:

"(1) In order that the military power of the allies may be adequately sustained, it is essential that in this country and under the present conditions, there should be no diminution in agricultural production.

"(2) The supply of competent labor available for the purpose of agricultural production is not abundant, but actually is deficient.

"The proper conclusion appears to be that the applicant, a competent person, who had been habitually and effectively engaged in labor essential to such production, ought not to be withdrawn from it.

"It is perhaps unnecessary to say that such exemptions are not granted as concessions on account of personal hardship, still less as a favor to a class. The sole ground of them is that the national interest is the better served by keeping these men at home. The supreme necessity (upon the existence of which, as its preamble shows, this policy of the Military Service Act is founded) that leads the State to take men by compulsion and put them in the fighting line requires that men shall be kept at home who are engaged in work essential to enable the State to maintain the full efficiency of the combatant forces, and whose places cannot be taken by others not within the class called out."

Ottawa, Dec. 8, 1917.

November was well patronized. Each person attending brought in a little bag as many cens as they were old. The proceeds, $35.30 will be spent on yarn.

Newcastle—"Putting Away Summer Clothes" was the subject discussed at the November meeting. The preserves and pickles donated by the members to the public hospital were must appreciated.

Patriotic—In November the Institute held a "Sewing Bee" for a member who has a number of small children and has been most unfortunate in having considerable sickness in the home. The "War Time Prayer" prepared especially for our Convention will be read at the regular meeting of this branch until the end of the war.

Penobsquis—A gentleman of the community entirely in sympathy with the work of this branch, presented the Institute with a load of hay which was disposed of in a short time and the proceeds from the sale will be utilized in patriotic work.

Petitcodiac—Sixty-two boxes to the soldiers overseas were shipped in November. The preparation of these boxes has so exhausted the funds, arrangements were made at the November meeting for a Band Concert and Pie Social in the near future.

Parkers Ridge—There being just the one church in the community and all the members of the Institute attending, this branch is giving assistance towards its upkeep. A lamp is being placed at the front entrance and wood is being purchased for the church and parsonage.

Petit Rocher—The members of this branch seem most active in promoting the work of the Institute. They have a scheme in mind whereby they feel sure they cannot help but take a prize in the membership and programme contest for 1918. The membership numbers 18, yet 38 boxes were prepared in November for men from their community now serving in the King's Army "Somewhere in France."

Ripples—At the September meeting each member was given 10 cts with the request that it be turned into $1.00 before the October meeting. The mmbers have expressed their willingness to send reports of their meetings to the local newspapers.

Sussex—This branch has bought a new piano and placed it in the Agricultural School. "Needs of the Town" and "Victory War Bonds" came in for considerable discussion at the November meeting.

Stanley and Cross Creek—A committee from the Institute was apponited at the October meeting to assist the Agricultural committee in arranging exhibits at the Stanley Fair. The Institute had a very attractive booth at this Fair. Souvenirs from overseas were on exhibition and persons wishing to inspect them were "tagged." The young ladies solicitated contributions from the crowd, and altogether the sum of $129.00 was raised.

Upper Sackville—Practically all the October meeting took the form of an open discussion. Roll call was answered with economical suggestions. Ice cream and frostings were considered extravagant at this time by the majority of members, although some thought if ice cream took the place of puddings or pies at a meal, it was all right. That cream should be made into butter when it is so scarce, is the opinion of this branch.

Whitneyville—The first meeting since organization in October was held November 12th, the subject being "Inexpensive Christmas Gifts." The members showed their interest by displaying a number of attractive gifts at most reasonable prices. A programme committee was appointed to map out a programme several months in advance, which is surely a start in the right direction.

Fredericton—Certainly doing a stroke of work these days. Taking an active part in cooperation with the I. O. D. E. in the distribution of the food pledge cards. November 23rd, under the auspices of the Institute, a Musical Company, entitled "The Harmony Glee Club" put on an excellent concert thoroughly enjoyed by a large audience. This is the first of a series of rondcrts to be held during the winter months under the auspires of the Fredericton W. I. This branch is also holding once a month a meeting for the purpose of giving the women of the city information along food conservation lines. Mrs. Lawlor, President of the St. John Housewives' League, gave an instrhctive lecture in September illustrating with lantern slides "The Cheaper Cuts of Meats and Their Food Value." Miss Jean Peacock, Household Science Teacher of the Provincial Normal School, gave a very helpful lecture in October on Food Values. This month she demonstrated "Meat Substitutes," and next month she will demonstrate the making of Soups. These meetings are becoming very popular and are being well patronized by those women wishing to do their "bit" and "best" in shortening this terrible war. The Institute will again this year hold a "Hospital Day." A house to house canvass will be made, when housekeepers will be asked to give a jar of preserves or pickles to the hospital. Last ycar over 600 jars were collected and this year the members hope to collect cven more, when they will be equally divided between the Victoria Public and Military Hospitals.

Middle Southampton—A very encouraging meeting held at the residence of Mrs. F. R. Brooks, December 1st. A committee was appointed and given a sum of money to purchase Christmas gifts for the small children of the community. A graduate nurse gave an instructive address on "Typhoid Fever."

Welsford—Four new members were gained at the December mcting. Arrangments were made to tender a reception to a returned hero in the ncar future. Afternoon tea, served at the close of the meeting, addcd to the treasury, $1.50.

Devon—Six new members joined at the November meeting. The Nashwaaksis members were the "Guests" at this meeting, and a programme consisting of vocal solos, piano selections, guessing games, etc., was much enjoyed by all. A valued member, soon to lcave the community, was presented with a casserole at the December meeting.

Queenstown—The November meeting was held at the home of the president, Mrs. S. L. Peters. Mrs. T. H. Scovil read a paper on "The Duty of Self Control." The Institute agreed to distribute Food Pledge Cards over the district, thereby showing their approval of and sympathy with Canada's Food Controller. The Institute is making one of their members Nursing Sister Edna B. Davis a life member of the Red Cross Socicty and the sum of $20.00 was subscribed for that purpose at this meeting.

Point de Bute—"Should Children have an Allowance", was the subject so ably handled by Mrs. Frank Trueman at the November meeting. The roll call was another enjoyable feature, the members giving their views on "Given a Dollar, how would you spend it in order to get the most good out of it?"

CROWN BRAND
CORN PURE SYRUP

Children prefer it to the most expensive butter. Why not save money by using more of this syrup ?

In 2, 5, 10 and 20 pound tins—3 lb. Glass Jars.

Write for free Cook Book. 34

THE BATTLE CRY OF FEED 'EM

Yes, we'll rally round the farm, boys,
We'll rally once again,
Shouting the battle cry of Feed 'Em.
We've got the ships and money
And the best of fighting men,
Shouting the battle cry of Feed 'Em.

The onion forever, the beans and the corn,
Down with the tater—it's up the next morn—
While we rally round the plow, boys,
And take the hoe again,
Shouting the battle cry of Feed 'Em.

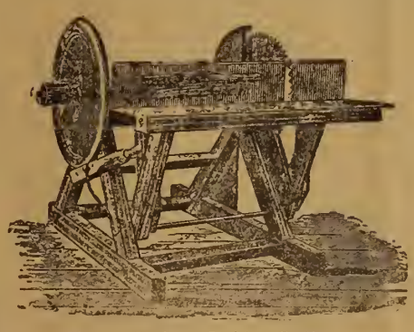
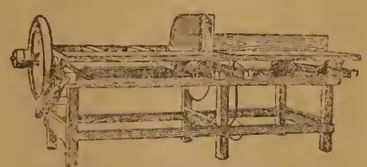
Save the expense of hiring an engineer. Book recently revised to 254 pages. Illustrated. Endorsed by engine manufacturers and leading engineers everywhere. Price bound in cloth, postpaid $1.50. Address, Windsor Supply Co., Windsor, Ont.

Why Sussex Wood Cutters Satisfy

It's in the Design



Short Swing Table Cutter



Flat Roller Table Cutter

TABLE made of heavy steel plating, bottom and back in one solid piece firmly bolted to birch frame.

FRAME made of well seasoned birch, mortised and bolted together.

ARBOR of best quality machinery steel 1¾" diam.

BALANCE WHEEL solid webb weight 150 lbs.

PULLEY solid for use with engine or ratchet collar for Tread power.

BEARINGS of high grade babbitt, and grease cups attached.

SAW, best quality 10 guage guaranteed.

Our Long Swing Table cutter is the most popular machine on the market. Ask our nearest agent or write us for full particulars, it will pay you.

Remember, we are sole manufacturers of the famous Star Feed Cooker and Star Root Pulpers.

Prompt Delivery guaranteed.

The Sussex Manufacturing Co., Limited,
Sussex, New Brunswick

SHARP PAINS SHOT THROUGH HEART.

Thousands of people go about their daily work on the verge of death and yet don't know it.

Every once in a while a pain will shoot through the heart, but little attention is paid to it at the time, and it is only when a violent shock comes that the weakness of the heart is apparent.

There is only one cure for the weak heart and that is Milburn's Heart and Nerve Pills.

Mr. H. A. Young, 83 Hayter St., Toronto, Ont., writes:—"I used to have sharp pains shoot through my heart, suffered from shortness of breath, and was so nervous I could not sleep at night. A friend advised me to try Milburn's Heart and Nerve Pills, and after one box I found great relief. Three boxes completely cured me."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

A STEAM COOKER VALUABLE UTENSIL

Steaming is cooking foods by moist heat in the vapor arising from boiling water. It is the most gradual of all the methods of cooking, and though this necessitates the use of more fuel, yet, as many different articles of food can be steamed over one vessel of boiling water, it is really economical. Its extent depends greatly upon the appliance at hand. An ordinary perforated kitchen steamer with a close-fitting lid is generally all that is required for simple household cookery.

It is a pity that this most excellent method of cooking does not become more generally adopted for cooking meat, poultry, fish, vegetables, puddings, fruit cakes and bread. Most food that can be boiled can also be steamed; it is not advisable to cook large joints of meat by this method because of the length of time required to cook them thoroughly, but smaller pieces of mean, fish, puddings or vegetables are delicious cooked in steam.

Apart from the old-fashioned steamers, there are several improved patterns, which are so arranged that several articles—indeed, four or five courses—can be cooked in one steamer; the appliance is constructed so that each article of food is in its own compartment, so that while the steaming operation goes on, the flavor of the other articles does not affect the contents of the compartment above or below.

A good steam cooker is a blessing to every home, as it is so useful and economical. It saves food, as nothing is lost by evaporation; there is no shrinkage of meats and nothing is burned. It is easy to manage and keep clean, as there is no scouring of pots and pans. A great variety of food can be cooked at the same time with very little attention.

Food cooked by steam is recommended by physicians as more healthful and nourishing than when cooked in any other way. A large portion of the juices and "goodness" is retained in this way which is usually boiled away or evaporated in an oven.

Advantages of steaming over boiling are: (1) The gradual heat renders the food more digestible, hence its special value for invalid cookery.

2. Puddings and souffles are decidedly lighter and richer than when boiled.

3. No water can ever get into contact with the articles steamed.

4. None of the nutritious elements of meat, fish or vegetables are lost in the water, thus all foods retain their full flavor and food value.

5. Pudding cloths are not required, thus the washing of them is saved.

THOUGHT BABY COULD NOT LIVE

Doctors said chances were small because of Severe Stomach Trouble, But Dr. Cassell's Tablets cured her.

Mr. Corby, Harriston P.O., Ont., says:—"Our little girl was weak from birth, and though we tried doctors' medicine and other things she got no better. She just lay and cried, and neighbours all thought we could not save her. The doctors said she had stomach trouble, and that her chances were small. Yet Dr. Cassell's Tablets cured her. They have been worth their weight in gold to us. I don't think there is any medicine for children like Dr. Cassell's Tablets."

A free sample of Dr. Cassell's Tablets will be sent to you on receipt of 5 cents fro mailing and packing. Address Harold F. Ritchie and Co., Ltd., M'Caul-street, Toronto.

Dr. Cassell's Tablets are the supreme remedy for Dyspepsia, Kidney Troubles, Sleeplessness, Anaemia, Nervous ailments, and Nerve paralysis, and for weakness in children. Specially valuable for nursing mothers and during the critical periods of life. Price 50 cents per tube, six tubes for the price of five, from Druggists and Storekeepers throughout Canada. Don't waste your money on imitations; get the genuine Dr. Cassell's Tablets.

Proprietors, Dr. Cassell's Co., Ltd., Manchester, Eng.

WHOLSEOME FOOD AND GOOD LOOKS

Every girl and woman wants to look as well as possible and that is perfecty all right, and what they should try to do. But no one can be good looking, or even wholesome looking unless they are healthy. We cannot have the clear skin, right eyes and the necessary vitality unless we have pure, wholesome blood coursing through our veins, and to have pure blood four things are necessary, good, wholesome food, fresh air, plenty of exercise and sufficient sleep.

With regard to food, to be healthy one must not eat much meat. Meat if eaten in large quantities, has a bad effect upon the health and consequently upon the complexion. It causes uric acid in the blood, rheumatism and hardening of the arteries. On the other hand, "beauty food" is another name for the vegetables and women and grls who ilve in the country may grow in their own gardens, and have in a fresh and wholesome condition, all the beauty food which makes for health and good looks.

When we are eating carrots, onions and potatoes we are taking a course in natural food that acts like a cosmetic, making the skiin clear and soft and rosy. Whatever affects the quality of the blood affects the hair, the eyes, the lips the skin and the figure, as well as the internal organs. The blood which passes and repasses thoughout the entire body either carries strength and nutriment or depletes every organ of the body. And the blood picks up its nourishment from the food we eat, and so to be healthy, wholesome and good looking we must eat plenty of wholesome vegetable foods, and fight shy of much pastry, meat and candy.

COMMON SENSE IN CHOOSING FURNITURE

Get good furniture when you buy. It will pay you in the end. Some young, inexperiened housekeeper will buy a bunch of cheap, useless furniture instead of using good common sense and getting what she needs and of a better grade. In selecting furniture, not only beauty of line, but adaptability to service must be considered. Usually too much attention is paid to appearance, and not enough to service. As a consequence furniture bought because of its looks when tested out does not measure up in the actual service expected. Although an experienced designer will never sacrifice service for beaut, at the same time he will see that both are combined. Better any day a half houseful of good, serviceable furniture than an over-loaded one of cheap junk.

In polishing furniture, never use cheap polish, powder, kerosene oil or vinegar, because the acid in them will dull the finish and eventually destroyit. Get a good grade of polish. First wipe the surface with a soft cloth which has been wrung out of slightly warm ywater. This will remove the dust. Then give it a liberal coat of polish, applying it with a brush so as to reach all corners and carvings. Use at least two cloths (cheese cloth is best) in removing the poish. Unless all excess polish is removed it will collect dust.

Varnish is made of gum and should never be expoced to extreme heat. If furniture stands too near the stove or where he sunlight falls on it, the varnish will become soft and blister. Sudden hanges of temperature will cause the finish to crack and look as if it were full of small scratches. If gas or steam heat is used a bowl of water should always be kept in the room. Otherwise the air will become too dry and cause the glue in your furniture to crack. Then the joints will become loose. Standing near an open window on damp or rainy days will deaden the finish on your furniture and it will probably peel off later. The wood will also absorb dampness and swell, causing the glued joints to loosen.

HOW FURNITURE MAY BE REFINISHED

Most varnished furniture in the course of time needs serious attention and most funiture is varnished. Somethe varnishes can be rubbed down with boied linseed oil and pumice stone, giving a duller polish, but more often the varnish should be removed. To do this, get a prepared varnish remover. Apply to surface with a brush, let stand about thirty minutes. Applyy the second time, let stand fif-

PURITY FLOUR

Establishes the highest standard of quality ever attained in the manufacture of flour.

It contains an extraordinary amount of nourishment which makes its use a real economy.

More Bread and Better Bread---and Better Pastry, too.

4

The low cost per cup

It is hard to believe that a cup of good, rich tea only costs about a fifth of a cent, but, you see, Red Rose consists chiefly of Assam teas—the richest, strongest teas in the world.

Red Rose easily yields 250 cups to the pound. And it's a tea of rare economy and flavor.

Kept Good by the Sealed Package

635

teen or twenty minutes, scrape off with putty or case knife or steel scraper. Another application of remover which can be wiped off with a cloth may be necessray. Then sandpaper surface, using medium to fine paper. Then rub down with oil and pumice stone, wiping off all oil and polish, using a wollen cloth. The piece can then be waxed, using a mixture of turpentine and beeswax or floor wax. It is better to rub down with oil several times before applying wax.

This gives a beautiful finish to old mahogany or walnut and brings out the beauty of the wood. Many an old piece could be made a thing of bauty by this treatment.

So much furniture is finished in golden oak and is unpleasantly shiny. Try finishing a piece and see how it improves the looks. It may need a coating of stain to even up the color where it has been scraped.

Any furniture finished in a wax or fumed surface should be rubbed down with oil a few times a year to preserve the finish. Be sure and wipe off all superfluous oil. Some of the most beautiful old English furniture never had any other finish but frequent treatments of linseed oil.—Nellie M. Killgore.

CAN YOU TELL WHEN GOODS IS ALL WOOL?

The laws of our country at present offer no protection to the puchaser of textile materials. If the price of "all wool, a yard wide" goods is paid and later it is found that the material is half cotton, there is nothing left for the purhaser to do but to enter it as "loss" in her profit and loss account. To be sure there are any number of stores where the dealers are truthful about the textile materials handled, but nevertheless a knowledge of a few simple tests may not come amiss.

Sometimes slezy, thin cotton material is made to look quite firm and attractive by the use of sizing or dressing. By rubbing a corner between the thumb, the sizing is removed and the real quality of the material is apparent. In very thin material the sizing may be detected by holding the cloth to the light. The starch will show between the threads.

An examination of the raveled warp and woof threads will often reveal much. Cotton fibres are short and broken ends of cotton threads will appear fuzzy. Linen fibres are long and conesquently broken ends of linen threads are more pointed than those of cotton. Cotton material feels warmer than linen.

Some woolen materials are "made over" that is, old woolen rags and short, broken fibers, and the clippings from broadcloth are used in its manfacture. Sometimes this can be detected by unraveling the end. The short fires are loosened and fall out. —Beyl Dixon, Colorado Agricultural College, Fort Collins, Colorado.

Much of the backache from which very many houewives suffer might be avoided if women would sit down while doing some of their kitchen work. One of the kitchen stools which are made for that purpose, makes this easily possible, as they are of the right size and height to uee at most kitchen tables. An old piano stool is better still, as it is adjustable.

How often we hear women who do their own cooking say that by the time they have prepared a meal and it is ready for the table, they are too tired to eat. One way to mitigate this is to take about half an hour before dinner, a raw egg, beat it until light, put in a little sugar and milk, flavor it and drink it. This will relieve the faint, tired out feeling, and will not spoil the appetite for dinner.

WORTH REMEMBERING

Jelly cakes should have the edges pared off carefully and rolled on a damp towel.

When bacon is good and sweet the lean is firm and red, and the fat quite white.

Strong ammonia water is excellent for removing iodine stains from the skin.

Sliced raw potato can be baked instead of fried if put in a hot oven, and they will be crisp and nice.

You can always have fresh mint in your house by growing it in water.

If salt is added to flour for thickening gravies it helps to keep it from lumping.

If a frock becomes spotted with rain, press it under a damp cloth. The process is long andtedious, but the rain spots will disappear. Press always until the damp cloth is dry, then wet and move to another place.

To keep the skin of the neck in good condition there should be a complexion scrub at least once a week. Make a suds of hot water and some mild soothing soap and scrub the neck with a complexion brush. After the scrub the neck should be well splashed with cold water to harden the tissues and prevent flabbiness.

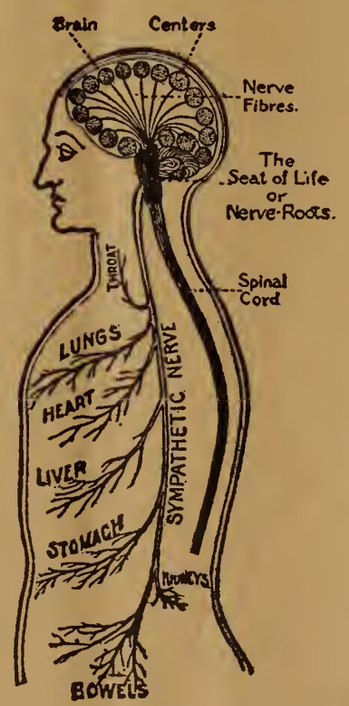
Study the Inside Nerves

WITH the brain as its centre, the nervous system reaches out to every organ of the human body. From the spinal column and from the various nerve centres the thread-like nerve fibres find their way to every nook and corner of the body, controlling all movements and action, and making a living being of the mass of flesh and bone.

Without the nerve force which is manufactured in the brain there could be no beating of the heart, no breathing of the lungs, no digestion, no activity, no life.

It is only when you think of the nervous system in this way that you begin to realize its true importance and to appreciate the far-reaching effects of any derangement of the nerves. Any break in this connection with the brain, or any pressure on the nerve fibres to interfere with the transmission of nervous energy, means helplessness or paralysis of the part affected. It may be the loss of power to use the hand or failure of the stomach to do the work for which it was intended.

To Learn the Cause of Weakened Vitality



If there is ever a time when sympathy is needed it is when the nerves give way. But you must have more than sympathy if you are to recover your nervous energy. The feeble, exhausted nerve cells must be nourished back to health by the use of such treatment as Dr. Chase's Nerve Food.

This treatment is so gentle and natural in action that it admirably suits the delicate condition of the exhausted nervous system, and at the same time is wonderfully potent in restoring vigor and strength.

A little patience is necessary in order to build up the nervous system so far run down, but as headaches disappear, digestion improves, and you rest and sleep better, you will be encouraged to continue this treatment until restoration is complete.

Dr. Chase's Nerve Food

50 cents a box, a full treatment of 6 boxes for $2.75, at all dealers, or Edmanson, Bates & Co., Limited, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

CURING MANGE

It is a stockman's axiom that steers which spend too much time at the rubbing posts cannot put on fat at a profit. It is just as true that an animal which goes to market with its neck and shoulders bare from rubbing will be discriminated against by buyers.

But the steers are not to blame. They don't rub because they would rather rub than eat. Ten to one it is because they are affected with mange, a skin disease caused by a small parasite, more troublesome in the fall and winter than at any other time of the year.

Spraying and dipping the animals with coal-tar preparations is advised for the control of these parasites. That means the work must be done before cold weather comes on. A second dipping, ten days after the lrst, will get rid of any insects which hatch out after the first treatment. Soft water is best for mixing the dips, since they do not mix readily with hard water.

A dipping vat is commonly used when a large number of animals are to be treated. For only a few, the dips may be applied with brushes or old brooms, scrubbing hard enough to dislodge the scales under which the insects are secure against anything but vigorous treatment.

When a dipping vat is used, a plunge is not enough to do much good. Every animal must have a real tub bath lasting several minutes. More good is accomplished if a brush is used to soak up the affected parts befor the animal's are dipped.

After the bath, clean quarters. The parasites breed in sheds, on the feed-racks and bunks, and on the fences and rubbing posts. Since those things cannot be dipped, a spraying or scrubbing with some of the coal-tar preparations is the logical means of cleaning up the quarters. If that is not done, the cattle will soon leave the feed-racks for the rubbing-posts again. Dipping without follow-up measures is of little value.

GRAIN FOR THE RAM

A ration formed of about 5 parts oats, 2 parts bran, and one part linseed oil meal, is an excellent grain mixture for the ram during the breeding season. A pound or a pound and a half per day for an average sized ram will be found sufficient if he is on good pasture, or being fed on hay, clover or alfalfa. If not used to grain start feeding very lightly and gradually bring up the amount to what the ram can eat with safety. The idea in feeding grain at this season is not to fatten the ram, but to put him in hearty, thrifty condition.

THE FARM HOME THAT IS UP-TO-DATE

Farm families deserve all the modern conveniences that help make farm homes more comfortable and attractive. Such conveniences are used most in the winter, and are most appreciated in cold weather when doing the regular work and going places mean exposure in all kinds of rough weather. But now is the time to make plans for them, at least come to the conclusion to do something in the way of improving the home if steps have not already been taken in that direrrtion. Woman's work in the farm home is heavy enough—too heavy in many instances—without adding to it unnecessarily. Modern heating, lighting and running water outfits lighten the farm woman's work wonderfully, their cost is not high, and they should be secured at the earliest possible moment| Most farmers love their wives well enough, but a good many seem to be perfectly willing for them to go on supplying water, heat and light in the old, laborious, inefficient way. Get all the enjoyment and satisfaction you can out of living, and start the getting right away.

SALT VERSUS MILK

Some men seem to think a cow doesn't need any salt, others go to the other extreme and load her down with it, while a third faction strike a happy medium and are bountifully repaid. True feed and water carry some mineral matter but not enough.. For the dry cow about five ohnces per week meets the average demand with an additional amount given to the producing cow in direlt proportion to the milk flow. An animal produding twenty pounds of milk per day will require an additional four ounces per week; the cow giving forty pounds, twice that much and so on. Thus the twenty pound cow could use approximately half a pound of salt per week, or better still divided into daily allowances of a little over one ounce.

Encouraging the drinking of a large amound of water by feeding excess salt has no advantage, and may even do harm. If the cows are allowed free access to a continuous salt supply they will use an ample amount but still do themselves no injury through overcrowding.

EARLY PORK CHEAPEST

Most economical gains on hogs are secured while the pigs are young, and for that reason it is advisable to finish hogs as early as possible, weighing 200 pounds when marketed. Gains on adults are expensive, and feeding them during too long a period loses money.

Weaning time is the critical stage in the life of fall pigs. Three weeks before weaning teach them to eat, supplying a box or creep which admits the little ones only. Feed a little middlings and skim-milk, adding, later, some sifted ground oats.

Pigs may be self-fed from six weeks onward. It is best, however, to start self-feeding at about ten weeks of age. With paddock feeding a self-feeder will saxe fifty per cent of the labor. On pasture, with running or a continuous supply of water, nearly seventy-five per cent of the labor may be avoided.

DATES TO REMEMBER

"The Annual Convention of the Dairymen's Association of Nova Scotia will be held at the Agricultural College, Truro, on Jan. 10th and 11th, 1918."

"The Dairy Course for Cheese and Buttermakers of the Martime Provinces will be held at the N. S. A. C., Truro, for four weeks beginning March 13, 1918."

HOW TO STOP BLIGHT

Blight in fruit trees can only be cured by cutting out all infected branches. These must be carefully destroyed to prevent further spread. Furthermore, the instruments should be sterilized after each cut in a solution of corrosive sublimate in water, 1 to 1000, as an additional precaution against infection. Paint cuts with white lead and linseed oil to protect against decay.

THE APPLE INDUSTRY

It is not more than two years since the Dominion official charged with supervision of the apple industry warned that orchards had been set out far in excess of the needs of the market and that overproduction was certain to result. A careful observer now declares that there is danger of an apple famine in Ontario. Orchards generally neglected are falling into decay. That, we suppose, is a result of the failure of labor on the land. A correspondent complains that spraying and care no longer assure a crop, and makes the suggestion, probably fanciful, that spraying, by destroying the good and bad animal parasites, has left a free field to destructive fungi, which are proof against spraying—The Weekly Sun.

The three essentials for successful calf raising are cleanliness, care and regularity.

Much caution should be exercised in the administration of drugs to pregnant mares.

At foaling time, if indoors, the mare should have plenty of room and clean bedding.

It is just as important to keep the girl on the farm as the boy, and she will be more likely to stay there if the housework is made interesting. In no way can this be as well accomplished as by modernizing the home in every detail.

This Christmas
Let Your Choice be a—
"William & Mary" Period Design $190.00
Pathephone
LET it be a Pathephone because the Pathephone has all most desirable features possessed by other phonographs in addition to its exclusive improvements.
For instance, the Pathephone plays with a genuine polished Sapphire Ball which never requires changing, instead of a scratchy, scraping needle which has to be changed after every record. The Sapphire Ball is part of the Pathephone equipment. It never wears out and Pathe' records are guaranteed to play over 1,000 times without wearing.
The Pathephone music is wonderfully full and clear and natural.
The Pathe' cabinets are the most beautifully designed of any, and will be a splendid acquisition to the most exclusively furnished home.
Do You Know—
The Pathe Sapphire Ball replaces the old-time scratchy needle.
It produces better music.
The Pathephone plays all makes of records as well as Pathe records.
Pathe repertoire includes the cream of the world's best music.
The Pathephone is a combination of French inventive genius and Canadian manufacturing brains.
The Pathephone costs no more than ordinary phonographs.
Your present talking-machine can be exchanged for a Pathephone on attractive terms. Write to us at once for name of nearest dealer and get our free catalogue, splendidly illustrated, and also containing chats on Period Furniture.

Meat is The Best "Fighting" Food

The fighting forces of the Allies are fed heavily on meat.

There is a reason. The nutrients in meat are more readily and completely digested, and give vim and energy to a greater degree, than nutrients in cereal grains.

Cereal grains supply little fat but a great deal of starch, whereas meat, especially bacon, supplies much fat but very little starch, and fat is worth more than twice as much as starch for producing energy.

In other words, no other food is equal to meat as a producer of driving force and stamina —it is the food with "the punch."

The armies of the Allies must be ensured adequate supplies of this "fighting" food. This means that a great increase in meat production is required by Canada and the United States, because the demand for meat overseas has been so enormous that there are to-day 115,000,000 fewer animals in the herds of Europe than before the war. Great Britain, France and Italy are dependent upon Canadian and American producers to save the day so far as meat is concerned.

There is no time to be lost. The shortage of meat overseas must be relieved as quickly as possible.

Hogs The Solution

The supply of meat can be increased more quickly through hogs than through any other stock animal because hogs are very much more prolific, and they are ready for market at an early age.

The most efficient meat-making machine in existence is the hog:

(1) It produces more meat from a given amount of food than is produced by any other animal.

(2) It gives more dressed carcass in proportion to its live weight.

(3) The carcass of the hog contains more edible meat in proportion to bone than the carcass of any other animal and it is about 50 per cent. fat which is so vitally needed in the rations of our fighting men.

An Urgent Call

Canada has responded nobly to every call that has been made for men, for money and for farm produce. To-day's call for increased hog production is of the utmost urgency.

The Government now controls and restricts the profits of the Packing Houses. The hog producer is assured his fair share of the price paid by the consumer.

The Flour Mills are under a form of license with restrictions on profits. Bran and shorts will be available at reasonable prices.

The huge new corn crop of the United States, estimated at 600,000,000 bushels greater than last year's, will be available to Canadian producers. This crop is under effective United States Government control to prevent speculation.

One Commission representing the Allies will do all the buying of the meat for export overseas. This will be an influence in stabilizing the market and preventing wide fluctuations in price. This fact, considered in association with the great meat shortage in Europe, justifies confidence in the profitable possibilities of hog raising in 1918.

Save the Young Sows

Young sows which are slaughtered now only produce about 150 lbs. of meat per sow. By breeding them, many times that quantity of meat can be produced ready for market in ten to twelve months. Every pound of pork that it is possible to raise will be needed. It will take an enormous quantity to meet even a fraction of the present European shortage of 32,425,000 hogs, which is ten times the number of hogs there are in Canada to-day.

FIRST AID TO ANIMALS

(Continued from page 169)

also a knife for cutting hoofs, and a float for filing the teeth. Every dairyman shuld own a milk fever outfit, in order to be ready to promptly apply the air treatment, if necessary. He should also own a cattle trocar and canula for puncturing cattle for bad cases of bloat. Remembering a much smaller trocar and canula should be used when puncturing horses or sheep for bloat. A probang is another instrument that cattlemen should own, handy to use in case of choke.

First Aid Operations

Animals on the farm are continually being wounded and the first step to take in the care of a wound is to promptly explore the parts with a view of ascertaining if there is a foreign body, then arrest the hemorrhage to prevent waste of blood. This can very often be done by twisting the blood vessel or tying it, or by compression. The wound should then be washed with an antiseptic solution of some kind, however, remember it is important that the wound have proper drainage. Therefore, it may be necessary to do a little cutting before drainage is obtained. A wound that pockets seldom heals quickly. Small wounds about the head and neck should first be cleaned, peroxide of hydrogen applied (stitching material dipped in same), then edges of wound brought together with stitches as evenly as possible, and paint the edges of wound with tincture iodine or apply equal parts oxide of zinc and boric acid, or any other reliable commercial dusting powder. Never stitch a wound unless you believe it necessary to hold the tissues together.

The Medicine Chest

Your medicine chest should contain coal tar disinfectant, carbolic acid, aromatic spirits of ammonia, tincture of iodine, rectified oil of turpentine, raw linseed oil, Glauber's salts, epsom salts, cooking soda, borax, boric acid, salicylic acid, ginger, gentian, charcoal, powdered copperas, sugar of lead, tannic acid, castor oil, olive oil, etc. In a future letter the writer will tell how these different drugs can be best given or applied as home remedies.

W. C. FAIR, V.S.

It's a money-saver—
this book we send you free
It's no exaggeration to call this book—
"What the Farmer can do with Concrete"—
a money-saver. It makes money by saving money—for every farmer who reads it and who acts on the advice and instructions it contains. How does it save money? Simply by telling how to build farm improvement of Concrete.
The farmer nowadays realizes that he is under a terrible handicap in his efforts to make money, if he has to be constantly sinking profits in repairs. Only by using Concrete can he have buildings that do not call for repairs and painting. Only with Concrete for his building material can he have his farm fireproof, waterproof, watertight, repair proof, vermin proof and sanitary.
In our 100-page book, there are directions which enable the farmer to construct all sorts of improvements of Concrete, in odd times—with the help of his man. Send for this remarkably useful, money-saving book. Mark on the coupon the subjects which are of immediate interest to you.
WHAT THE FARMER CAN DO WITH CONCRETE
By building Roads of Concrete we can reduce the cost of living, and at the same time increase the farmer's profits on everything he sells or buys.
The welfare of the farm demands Permanent Highways of Concrete. Our farmers need them for the hauling of garden-truck, fruits and dairy products into town. On Concrete alone can this hauling be done economically. It provides the only surface that resists the wear and tear of modern traffic. Concrete is, in fact, as necessary to successful road building as it is for successful farm construction. Concrete roads, like Concrete buildings, pay for themselves in the saving of repairs.

HOW DO YOU CURE PORK?

Here Are Some Tested Methods

Hog killing time is coming. Everybody is planning for next year, and the meat is to be gotten ready this fall. So fix plenty and some to spare. We are giving three tested methods and some points on smoking meat.

Dry Cure

Do not cut up the pork till the carcass is well chiled. Make a mixture of clean, fine salt, forty pounds, white or brown sugar 10 pounds, whte or black pepper 4 pounds, red pepper ½ pound. This will make enough cure for about 1,000 pounds of pork. If saltpeter is desired, use 2 pounds in the above mixture. It will give a red color to the lean meat, but has a tendency to harden the meat too much. Chili saltpeter may be used instead of the regular saltpeter by taking 20 per cent. less.

Rub each piece of meat thoroughly with the cure. Take special care to work the cure around the ends of the bone of hams and shoulders. Pack skin down on a table or in a box in a cool airy place. Do not place in direct sunlight or in a damp musty cellar. After four or five days overhaul the meat, rub thoroughly with the cure and repack; repeat this in about a week. Hams and shoulders should remain in the cure from one and one and a half days to two days per pound weight of piece; the latter time is safer for meat that is to be kept during the summer. Bacon shoud be in the cure a shorter time. Ten days will give a very nice mild cure to a six or eight pound piece.

Brine Cure

Make a brine by boiling 7 pounds of clean salt and 2 pounds of white or brown sugar with two gallons of water. If saltpeter is desired add one fourth pound. This gives about enough to cover 100 pounds of pork when well packed. Sprinkle a little clean, fine salt in the bottom of the barrel, rub each piece of meat lightly with the salt, sprinkle a layer of salt between each layer of meat. Put on a board and weight down with a rock. Alllow to stand over night. Tip barrel on side and allow the liquor to run out. Cover the meat with the cold brine and allow to stand in a cool place for four or five days. Overhaul, repack and cover with the same brine. Repeat in about a week. Give the meat the same length of time for curingas with the dry cure.

When the curing is complete wash off the excess cure and hang in the smoke house.

Plain Salt Cure

Make a brine of ten pounds of salt, two ounces of salt peter and four gallons of water. The carcass should be cut into smaller parts than for the brine ure. Pieces about six inches square will be the best. Put meat in a barrel and pour brine over it. When cold, cover and weigh down to keep meat under the brine. The pork should be kept in the brine until used.

Smoking the Meats

Pickled and cured meats are smoked to aid in their preservation. The smoke seals up the pores, acts as a vermifuge, aids in drying, and adds flavor to the product.

Green hickory or maple wood smothered with sawdust of the same material gives the best results. Hard wood are always preferable to soft woods. Resinous woods (pines, firs, spruces) should never be used, because they are likely to impart bad flavors to the product. In the production of Westphalia hams, Juniper wood and berries are used.

Before putting meat into the smoke house take it out of the brine and let it drip for two days. In cases where the brine was strong, it will be very advisable to soak the pieces in cold water over night to prevent a crust forming on the outside when it is drained. Then suspend all the meat so that no two pieces come in contact, as this would prevent uniform smoking.

A slow fire may then be lighted, warming up the meat gradually. In cold climates it is best to keep the fire going at a steady temperature until the smoking is completed in from 24 to 30 hours.

Smoke will not penetrate frozen meat. Flies should be excluded by keeping the house dark and the meat cooled by opening the doors and ventilators.

A dry, cool cellar or attic with free circulation will be the best place in which to keep smoked meats at all seasons, provided it is kept dark and the flies excluded. If it is desired to keep the meat for a long time, wrap it in waxed paper, then in muslin or canvas and hang it in a dry, cool place.

COSSAR STOCK FARM
Lower Gagetown, N. B.

Special prices to clear this stuff out as I want to close out by the end of the year. Learn something more about tbis stock, it may pay you—only a stamp.

T. J. HAWKINS,
Stewiacke, - - Col. Co., N. S.

WHY WHEAT IS NEEDED

(Continued from page 167)

years the wheat loaf has been the basis of life in Europe, with the exception of Italy. The art of household baking has long since been lost. Most of the bread is baken by bakers. For this reason alone it is almost impossible for them to substitute corn bread, which cannot be distributed by bakers. Furthermore, the actual household machinery of baking—ovens, etc.—has long since been out of existence in most European homes."

There are also serious transportation difficulties in connection with the sending of large supplies of other cereals than wheat to the Allied countries. With the exception of Italy they have few corn mills and corn meal is not a sufficiently staple product to be suited to transportation across the ocean. Moreover, corn meal requires more shipping space than does the same weight of wheat flour.

It has been estimated that the Allies will need to import, on the basis of their pre-war consumption, about 577.000,000 bushels of wheaf or the equivalent of wheat flour. The urgent necessity of economizing in the use of shipping obliges them to depend practically upon North Amrica for their cereal supplies. And on the basis of normal consumption here, North America's exportable surplus will not greatly exceed 200.000.000 bushels of wheat. The aggregate wheat crop of the Western European Allies has been estimated at not more than 400.000,-000 bushls. Adding to this the North American exportable surplus of 200.-000,000 bushels we have only 60 per cent of the Allies' requirements, leaving 40 per cent to be made up with other cereals. But, as already has been explained, a good bread loaf cannot be made by the bakers of Europe with only 60 per cent of wheat flour. If the people of North America, by reducing their consumption of wheat and substituting other cereals, will increase by 150.000.000 bushels this continent's exportable surplus of wheat, the Allied countries of Western Europe will have enough wheat flour to hold mixed cereals together in a baker's loaf.

North America's consumption of wheat on the normal basis is about 600 000,000 bushels, so that to spare enough to give our Allies overseas a good loaf, every man, woman and child, on the average, must reduce his or her consumption of wheat flour by at least one-quarter and substitute other cereals to make up the difference.

TRURO AGRICULTURAL SHORT COURSE

We commend to the attention of our readers the Short Course at the College of Agriculture, Truro, advertisement of which will be found elsewhere in this issue. No other Short Course in Canada has, for a succession of years, enrolled such large numbers of students as the Truro course and the one to be held from Jan. 2nd to 10th next should be no exception to the preceding ones. In former years, many students have attended from New Brunswick and Prince Edward Island as well as from Nova Scotia, and this year the College again extends an invitation to all from these sister Provinces who can make it convenient to attend. It is worth while going to Truro, if for nothing else than to examine the magnificent college herd of cows in which during the past year, some outstanding milk records have been made. Included among these are the two year old College bred Ayrshire heifer MacGregor's Laurie May, that has just completed her first lactation period with 13,060 lbs. of milk and 638 lbs. of butter, and the two year old Holstein heifer College Canary Rosie, that likewise in her first lactation period has completed the year with 15,193 lbs. of milk and 632 lbs. of butter to her credit.

A special feature of interest to many Maritime Province farmers will be the tractors, with which the Nova Scotia Department of Agriculture has been experimenting during the past season. One at least of these, the famous Ford tractor will be on exhibit and will be operated during the course.

COST OF HORSE KEEP AND HORSE LABOR

In two recent issues, tables showing the cost of keeping horses during winter at Indian Head Farm, and the cost of keeping a farm horse for a year on another Saskatchewan farm were given. Herewith is shown an itemized statement of the annual cost per horse of 154 horses in Illinois, as given in a recent bulletin of the U. S. Department of Agriculture. The statement follows:

Feed and Bedding	$68.75
Labor	13.99
Interest	7.90
Use of equipment	3.82
Shoeing	.86
Depreciation	3.46
Miscellaneous	2.12
Total	$105.85

The same bulletin shows the annual cost of 72 farm horses studied in Ohio was $129.43, and on 90 head in New York, $159.81. One item in the U. S. table—net loss on colts—is disregarded here, also their credits for manure which amounts to $5.24, $8.20 and $13.36 in the three states respectively, also small items for appreciation and colt profits.

Taking the Illinois figures which, considering the crops grown on the farms where horse costs were studied, were most comparable to our own, the following information is given: Average value of horses $158; "stabling cost" includes 5 per cent interest on the average investment and insurance, taxes, labor, repairs and depreciation; "use of equipment" items are made up of a charge of 5 per cent interest on harness and miscellaneous equipment, repairs, insurance, taxes, and depreciation; "miscellaneous costs" embrace veterinary services, medicine, salt, etc.

In Illinois, the average number of hours worked per year by the 154 horses was 1,053. the average feed cost per hour worked was 9.56 cents. This was considerably lower than the average cost in either of the other two states. On one farm where the horses worked from 500 to 600 hours per year the feed cost per hour was 19 cents. This was due to feeding with expensive feeds though working an average of about 2 hours per day during the working days of the year. On six farms where the horses worked from 80 0to 1300 hours per year the average feed cost per hour was less than 5 cents, due to the judicious use of cheap feed and pasture, when the horses were idle. As feed is the largest item in the cost of keeping a horse and the feed cost per hour averages wll over 10 cents per hour for all the horses studied, it woul dseem that of the various ways of keeping down the cost of horse labor one of the best is to keep the horses busy. From the figures under review it is apparent also that large farms permit of more efficient use of horse labor than small farms. On large farms there were 22.2 acres in crop per horse while on the small farms there were but 16.8 acres per horse.

Fertilize and cultivate your garden this fall in anticipation of an early start next spring. Put away your garden tools cleaned and in good repair. If you have saved some good seed of your own growing such as beans, peas, lettuce, corn, potatoes and beets, put it away carefully in a safe, dry place.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex, N. B.

GEESE—Two large Geese and one Gander fit for breeding. The first eight dollars takes them. F. Baxter, Harcourt, Kent Co., N. B.

FOR SALE—Choice Tamworth boars and Collie dogs. J. Titus Barnes, Apohaqui. R. R. No. 3.

FARM FOR SALE five miles from Sydney. Price, Thirty-five hundred. Two thousand cost required. If interested write Ernest McLean, Coxheath.

BERKSHIRES FOR SALE—Sows bred, boars ready for service, young pigs ready to wean. All choice stock. Write if you want something good. Valley View Farm, Truro, N. S. J. R. Semple & Son.

FOR SALE—Aberdeen Angus Bull, 22 months old. Was first and champion at Halifax, 1917. Write for particulars.—GEORGE A BLACK, Westmoreland Point, N. B.

AYRSHIRE BULLS—One 22 mos., G dams on both sides 15,000 lh. cows, hred at Agricultural College; one out of fifty lh. cow eleven months old.—R. J. MESSENGER, Lawrencetown, N. S.

LADIES WANTED to do plain and light sewing at home, whole or spare time; good pay; work sent any distance, charges paid. Send stamp for particulars.—NATIONAL MANUFACTURING CO., Montreal.

Willow Glen Shorthorns

Entire show herd for sale. See our record at the recent Halifax show. All prize-winners from three year old cows down bred by myself, and sired by Champion and Sire of Champion Stately Monarch. Write for particulars.

SOLID COMFORT

"SERVICE" Stoves are unornamented, but if quick heat and good baking are matters of importance to you, a PLAIN STOVE at reasonable cost is worthy of consideration. There are very very many FREDERICTON-MADE Stoves in use in Eastern Canada. The steady demand gives us the impression that Plain Stoves are still used and still wanted, and we KNOW that each of our "SERVICE" Stoves is a source of great COMFORT to its owner. Heating-Stoves and Cooking-Stoves, and Furnaces for wood or for coal, they are PLAIN BUT SERVICEABLE.

FROM

Stoves and Furnaces let us direct attention to our "YORK" Turnip-Pulpers with vertical disk and side basket. They are extensively used in Eastern Canada, and each year brings an increased demand for these well-thought-of Root-Cutters.

ONLY GOOD GOODS

Besides the above-mentioned lines we manufacture Iron Pots, Tea-Kettles, Griddles, Frying-Pans, Bean-Jars, Oat-Boxes, Pig-Troughs, Cow-tail Holders, Window Weights, Horse Weights, Sled Bench Castings, Wagon Boxes and Nuts, Etc.

Agents Wanted

Farmers in the Maritime Provinces have learned by experience that they can raise from 50% to 75% greater crops without additional land by using Ontario Fertilizers. It is easy to sell these high class fertilizers to the farmers who are eager to get more production and secure the splendid high prices now prevailing. Fertilizer helps to offset their labor problem. Farmers and others are invited to write us for full particulars about our attractive selling proposition to agents.

Care and Management of the Dairy Herd

By R. S. Hulce, Associate in Milk Production, and W. B. Nevens, Assistant In Dairy Husbandry, University of Illinois

Introduction

Intelligent care of the dairy herd is essential to profitable milk production. In order that each animal may contribute its share to the income derived from the herd it must receive individual attention and care, and have the benefit of those general practices in the management of the herd which have been found by dairymen to give the best results. The following suggestions on the care and management of the dairy herd are intended to apply to general dairy conditions in Illinois rather than to all specialized phases of milk production.

Problems of General Care

Regularity

Dairy cows readily become accustomed to a regular daily program any interruption of which acts as a disturbing influence and tends to cause a decrease in milk production. There should be certain hours for milking and the same order of milking should always be followed. Thus, at the regular time the cows release the muscles controlling the milk ducts so that the milk is given down more quickly and easily. Regularity in milking is one of the important factors in keeping the milk flow constant.

It is immaterial whether the cows be fed grain before or after roughage, but it is desirable that the feeding be done at regular intervals and that the feeds always be given in the same order. Feeds which have considerable odor are usually fed after milking in order to prevent the absorption of odors by the milk.

Kindness

In the hurry of getting chores done, the dairyman sometimes forgets that dairy cows are naturally of a nervous and excitable disposition, and that under conditions of excitement or fear the milk flow is materially lessened. Driving cows on the run, chasing them by dogs and with loud shouting are not allowed on a well-managed dairy farm. In the stable all operations should be carried on quietly. When a cow kicks there is usually a reason for it; the teats may be hurt by the milker or the cow may be frightened. At such a time a little care in removing the cause and pacifying the cow will often prevent further trouble. Many good cows become confirmed kickers and consequently less profitable as a result of lack of careful observation and kindness on the part of the attendants.

Care at Freshening

The work of milk production, particularly in the case of a heavy producing dairy cow, coupled with that of the production of offspring, is a severe tax upon her vitality. In order that a cow may begin her period of lactation in good physical condition, it is desirable that she be given a rest of six to eight weeks previous to freshening. The length of the rest period is determined, not by any hard and fast rule, but rather by the amount of time necessary to put the cow in a good condition.

Drying-off the Cow.—Two of the essentials in reducing the milk flow are milking less frequently and supplying less feed. If the feed supply is decreased and the cow is milked as usual, since the act of milking is a stimulus to milk secretion, she will draw upon the surplus energy stored in her body in order to produce a normal amount of milk. Therefore, if the feed is reduced the milkings should be less frequent. When cows are giving a large amount of milk the drying-off process may be begun by leaving part of the milk in the udder at the regular milking period. After a few days one of the daily milkings may be omitted entirely. As the milk flow decreases, the milking may be done once in two days and then once in three days until the amount has been reduced to three or four pounds daily, when the cow need not be milked further. It is important that the drying-off process take place gradually in order to prevent injury to the udder.

Feeding During the Rest Period.—During the rest period the cows should be fed so that they will be in good flesh at the time of freshening. It has been shown that cows of the dairy type which are in good flesh at freshening tend to produce milk of a higher butter-fat content than those that freshen in very poor condition. The grain mixture to be fed during this period may consist of two parts corn meal and one part bran or ground oats. If good pasture is available, grain may not be necessary.

Care Just Before Freshening.—It is important that the ration during the latter part of the rest period be somewhat laxative. This is a matter deserving special attention if the cow is receiving dry feed. In this case, it is important htat she be fed a good quality of legume hay, such as clover, alfalfa or cowpea, or other laxative feed, such as silage. Any one of th following grain mixtures, which are somewhat laxative, may be used to supplement the roughage.

Equal parts of bran and ground oats

Two parts ground oats and one part oil meal

Equal parts ground oats, bran, and oil meal

Two or three days before the cow is expected to calve, she should be placed in a clean, dry, and well-bedded box stall. During the day in mild weather she may be turned out-of-doors, as a moderate amount of exercise during this period is beneficial. If a laxative ration has not been fed, a drench of Epsom salts, should be given. When a cow is given careful attention previous to freshening, fewer of the troubles attendant upon calving, such as retention of the afterbirth, milk fever, and udder troubles, are experienced.

After Freshening.—After the calf is dropped, careful attention should be given to the comfort of the cow. In summer it is well to spray her with a fly repellant, and in winter cold drafts should be avoided. If the temperature of the bran is very low, blanketing the cow for a few days is desirable. The stall should be supplied with an abundance of dry bedding.

Just after calving, the cow should not be allowed to become chilled by drinking cold water. The drinking water should be lukewarm during the first day at least, and for a few days should be not colder than that coming from a deep well.

Swollen Udder.—Some inflammation is usually present in the udder at freshening which causes a swollen and caked condition. By rubbing the udder vigorously with the hands several times a day or by allowing the calf to nurse for a few days, the inflammation may be reduced. When the udder is not greatly inflamed or caked, the swelling will usually subside in a few days provided milk is being given from all quarters. If the udder is severely caked, special treatment may be applied.

Feeding after Calving.—It is very important the cow be fed grain sparingly for several days after calving, so that she may gradually become accustomed to the feed. A small quantity of bran fed as a warm mash proves helpful. The grain ration which was fed just previous to calving may be fed for a few days beginning with the second or third day, after which the grain may be changed to the mixture which the cow is to receive during the lactation period. If the udder is not severely inflamed or caked, four or five pounds of grain per day may be fed on the third or fourth day and the amount increased at the rate of one-half pound per day. The grain may be increased as long as the cow continues to respond with a proportionate increase in milk flow. A legume hay and silage may be given in such quantities as the cow will consume. When these feeds are used, the amount of grain fed to Jersey cows should be about one pound per day to each two and one-half to three pounds of milk produced daily, and to Holsteins about one pound to each three to four pounds of milk.

Length of Time Cows are Profitable

Cows usually reach their maximum production between the ages of six and eight years, after which time the annual production begins to decrease. When the heifer calves from the best cows only are raised, one-fifth to one-fourth of the cows in the herd may be replaced by the hifers each year; in this way, or when purchase is the method employed in replacing cows, few need be kept beyond the age of eight years.

Cows are less profitable milk producers during their first lactation period than when they become mature, since part of the feed is used for growth. The loss occasioned by this additional cost of milk production is usually offset by the better prices which can be secured for the mature cows when they are sold before passing their prime. Good cows may be profitable producers up to the age of fifteen years, but comparatively few are kept to that age except for breeding purposes. After cows reach the age of eight years, the uncertainty as to how long they will continue to be profitable on account of failure to breed and their lessened resistance to ailments becomes more marked. The uncertainty is probably greater where forced feeding in record making is practiced.

Replacing Cows In the Herd

One of the discouraging but usually certain losses involved in milk production is the depletion of the milking herd thru accident, failure to breed, or diesase. It is sometimes a serious problem whether to maintain the normal quota of the herd simply by the purchase of cows of milking age or by rearing the heifer calves from the best cows in the herd.

Purchasing.—When cows are replaced by purchase of others, the labor required in caring for the calves is reduced to a minimum, since the calves are sold at an early age. Under certain conditions, such as inadequate barn facilities for raising calves, limited pasture, and high prices for whole milk, purchase may be the more feasible method for maintaining the desired number of cows in the herd. However, the danger of the introduction of disease into the herd is greatly incrased by the purchase of animals. In purchasing cows on the open market records of previous production are usually lacking, so that judgment as to their productive ability is based on physical appearance alone. Some cows thus purchased prove disappointing as milk producers, since conformation is not always a reliable index to the value of dairy cows.

Rearing Dairy Animals.—When the heifers are reared to replace the cows, there is less opportunity for the introduction of disease, altho if calves are fed on unpasteurized skim milk or whey from a creamery or cheese factory, there is a chance that they may become infected with diseases from other herds. The skim milk or whey should be thoroly pasteurized at the factory before being returned to the farm.

When a bull capable of transmitting high milk-producing qualities to his offspring is used, the rearing of the heifer calves from the best cows is usually an economical and certain method of securing high-producing animals

to replace the aged cows. One of the greatest advantages in rearing such calves is that it is possible not only to maintain the standard of quality in the herd, but to gradually increase its production.

Season for Freshening

Some of the factors which determine the season at which the herd shall freshen are: length of the pasture season, amount of labor available, and market demands.

Spring Freshening.—Where it is possible for the herd to secure an abundance of good feed on pasture thruout a considerable portion of the year, it is usaully desirable to have the cows freshen in the spring in order htat one may take advantage of the inexpensive feeds at the stage of lactation when the largest amount of nutrients in the ration must be supplied.

Fall Freshening.—There are several advantages in having the cows freshen in the fall provided there is a sufficient supply of labor available during the winter months. Cows freshening in the fall may be fed so that they will produce a good flow of milk during the winter months. During the latter part of this period the flow tends to decrease, but it will be increased with the stimulus of spring pasture. The period of smallest flow will be during the latter part of the summer, when conditions are not favorable for high milk production and labor can be used to advantage in other farm work. This tends to equalize labor to a greater extent than when the majority of the cows freshen in the spring.

Calves born in the fall make good growth during the winter and are able to make some use of the pasture in the spring. Calves born in the spring are not sufficiently mature to make much use of pasture even in the latter part of the same season, on account of the annoyance of heat and flies.

When the milk is sold to a whole-milk market, it may be more profitable to have the cows freshen in the fall, since prices for whole milk are usually higher in winter.

Breeding Age for Heifers

The age at whch heifers should freshen depends largely upon their development and the season when it is desired to have most of the cows freshen. Altho the larger breeds do not mature at so early an age as the smaller ones, in most cases it is possible by liberal feeding to obtain sufficient growth so that heifers may profitably be bred to freshen at two years of age. It is seldom desirable for a heifer to freshen at an earlier age.

In deciding upon the time to breed, the size and development should be given greater consideration than the age, since it is important that the heifer have good growth by the time she freshens. However, if allowed to become too mature before breeding, especially in the case of animals that are heavily fed, there is sometimes difficulty in getting the heifers in calf.

It is undesirable to have cows freshen during the latter part of the summer because their milk production will be seriously hindered by hot weather, flies, and dried-up pastures. Rather than have heifers freshen during the summer months, it is advisable to postpone their breeding so that they will freshen during the cooler season.

BUTTER AND OLEOMARGARINE

Hoards' Dairyman has the following:—"We must ever keep before us the difference between oleomargarine and butter. The present price of butter, which is low compared with other food products, is leading many to use oleomargarine instead of butter. Most of these people do not know that butter contains a substance essential to growth, which is not found in oleomargarine. Dr. McCollum of John Hopkins University, has proven, through feeding experiments that vegetable and animal fats as used in oleomargarine do not contain the substance essential for growth and reproduction.

"According to Miss E. L.. Amery of the Wisconsin College of Agriculture, it has been found that in the hospitals of Germany the wounds of soldiers did not heal properly until their ration contained butter. Growing children need butter also if they are to develop properly. If these things be true it is not unreasonable to hold that butter is more nourishing than oleomargarne and contains a substance necessary to promote good health in all classes of people. The New York Health Commissioner says:

"Let us not be deceived by those who are interested in the sale of oleomargarine and lead us to believe it is as nutritious as butter. Facts, show butter contains an ingredient necessary for growth, for healing wounds, and for the health of people and that this ingredient is not found in oleomargarine.

"As butter is never an exclusive article of diet and a milk or vegetables and fruit in the general diet of children and adults contain the substances other than fats which butter has and oleomargarine has not, there is no advantage from the point of calories or of other food ingredients in replacing butter by oleomargarine in table use and cooking for children and adults.

"The Commissioner may be right in stating there is no difference between butter and oleomargarine in caloric value but he is wrong in saying there is no difference in other food ingredients.

"We refer our readers to Dr. McCollum's article in the current volume of Hoard's Dairyman, page 625. It will be noted that the rats receiving milk fat grew to normal size and reproduced themselves but those receiving vegetable and animal fats, from which oleomargarine is made, were scrawney and did not complete their growth or reproduce themselves until given milk fat."

Stable manure supplies fertility in the elements, nitrogen, phosphorous, and potassium. It also supplies organic material which has a physical effect upon the soil.

Can We Blame the Farmer if Production Fails

It will not be long before an appeal will be sent out to the farmers of the Maritime Provinces to increase their farm production during the coming season. Such an appeal is founded on the urgent necessity of the warring nations to be well supplied with food materials of all kinds. The importance of this need has been grasped by the farmer with the result that the total of last years crops has shown that an extra effort and an extra dollar has been spent by him to swell the amount of foodstuffs produced in the Maritime Provinces. How much greater this production can be increased remains to be seen. To some of us it is a matter of raising a sufficiently clamorous hue and cry about Increased Production and the output of farm products will be doubled in one season. To the one who has a true understanding of farming conditions in the eastern provinces the problem is not so easily solved. Such a one sees the difficulties, in farm operations, the farmer is up against and hence is skeptical as to how much the Increased Production campaign as now waged will bring results.

No one will but admit that the farmers, as a class, are just as patriotic and just as anxious for the allies to win in this war as any other class of men in Canada. They will do their share. But in case too great a burden should be placed upon them it would be well to keep in mind the conditions which they have to contend with and which handicap them in increasing the productivity of their farms.

What with the high price of labour; the high price of seed, fertilizer and machinery the Maritime farmer will be up against a bigger proposition this spring than he has ever before had to face. Of course, the one who is ahead of the game is differently situated. He will not hesitate to make an added investment in his farm as he knows the returns will pay good interest on his money. But what about the farmer who just manages to come out even at the end of the year. The annual returns from his years labour and capital are all in and when his bills are all met very little is left in his pocketbook to face the expenses of spring's work. We cannot say that this is an exceptional case. Unfortunately, we have too many of our farms in such positions. At any rate to such a person the opening of seeding time is fraught with difficulties. There is seed to buy—fertilizer to buy—labour to be paid for, and the worn out machinery to be replaced. The call comes to increase the production on his farm. How is he to meet the situation? Either he can buy on credit; borrow money from a friend or bank; or make the best of a bad bargain by putting in half a crop. It is doubtful whether it is sound policy for anyone to recommend the first alternative. The co-operative companies now established in different counties will not give credit. The long time credit given by middlemen of the class of local merchants is an expensive credit to the farmer, since the merchant must of necessity add a large percentage of profit on the buying price. The second alternative of borrowing from a friend is even just as difficult and probably not a sound business proposition. With a great amount of the unproductive capital now invested in Victory Bonds it may be quite difficult to find a loaning friend. In any case a high rate of interest must be paid and when a farmer has to pay over 5% for the capital used in farm operations, the money must be expended to the very best advantage which, without reflecting discredit on some of the more progressive farmers in the provinces, is not generally done. Barring the possibility of getting credit or borrowing from a friend, he must then go to the local bank. What about this alternative? We all know that the banks of this country are not a fit institution for the loaning of money to farmers. They were never intended to be such. Three months is the limit for farmers to use bank moneys, while it takes six to seven months for him to get returns on the money he invests on his farm in the spring time. Moreover, 7% is what he must pay on money borrowed in this way, and according to what we have said previously, this is too high a rate of interest for the farmer to pay for his capital. Hence then, we must eliminate this means whereby the farmer can raise his capital. Are we then going to let him grope in the dark through the situation as best be can, with the result that the much needed farm production is going to be hampered to a considerable extent. In the face of all this then can we not help but realize that there is food for thought, and serious thought for our legislators; for those in charge of the Agricultural work in the province, and for public men who are heralding the cry of Increased Production far and wide. Can they not see that CAPITAL is just as necessary as ENDEAVOUR for the farmer to produce more. Finally, can they not see that the much needed capital is not within the farmrs reach and it will not be unless some special legislation or some special arrangements be made to help him out along this line.

We might ask the question now,—Have the farmers been assisted in getting cheaper and more readily available capital in other countries? Yes. In European countries; in the United States and even in Western Canada, Rural Credit laws have been enacted. The Eastern provinces have yet to realize that before agriculture is to be put on a sound economic basis, and before this happy state of affairs will come to pass, some method must be devised whereby the farmer is assisted in getting cheaper money than he is now using. How this can be brought about is a difficult problem to solve. Owing to our provinces being sparsely populated the Rural Credit laws of Europe would not work to advantage. The United States have adopted, with good results, a modified form of the European plan. The West have worked out a scheme similar to the American Credit system, but it is just questionable whether or not either of these would be applicable to eastern conditions. At any rate the time is present when our legislators should get their heads together to solve the problem. It takes time to formulate a thorough working Rural Credit law. The details connected with it are so varied that it is beyond question to think of having a Rural Credit law in operation this spring. Still could not something be done to improve the conditions the farmer has to meet in a very short while? Could not some assistance be given during the coming season. Could not some arrangements be made with the banks whereby money could be loaned on long term credit based on farm and crop valuation? We will let the question rest here, temporarily, for some one else with the interest of the Maritime Provinces and the interest of the British Empire at heart to continue the discussion on this topic.

Isn't it Strange? — — But Dairy Dan's Wife had the Right Idea!
The Sharples Separator Co., Toronto, Can.
TURN FASTER PAPA!
Look Papa you are Still Losing that Dime!
Maria—Sew Up this D— Hole I Lost a Dime
SHARPLES SEPARATOR
Saves Cream Thrown Away By All Other Separators
Dime
Dairy Dan was a regular feller—had a ten-cow dairy and a fixed-feed separator.
But he couldn't turn that fixed-feed separator up to regulation speed. He lost a dime's worth of cream anyhow—twice a day.
He hated to admit that this constant loss would have more than paid for a modern seperator which skims clean at any speed.
But one day he discovered a hole in the pocket of his 6-days-a-week suit—commonly called overalls.
And he sure did give Maria an awful call-down for her carelessness.
She got peeved and showed him how he could mend his carelessness—by buying a SHARPLES SUCTION-FEED SEPARATOR.

Moderate Estimate of the Profits From Keeping a Brood Sow This Winter

The man who plans to respond to the strong appeal of Food Controllers Hoover and Hanna to speed up hog production by saving young sows this Fall, wisely considers the business as well as the patriotic side of the venture. Sows are worth high figures and the necessary winter feed is proportionately high. It is not to be wondered if doubts as to financial returns are entertained. With an aim to settle this question we obtained some facts from Professor Trueman, of the N. S. Agricultural College, which we herewith set forth:—

At the College Farm the brood sows are fed on an average of 2 lbs. of mixed meal and 20 lbs. of mangels per day, up to the time of farrowing. The practice is to give them 4 lbs. of meal until they get in condition, and mangels along after that. After harrowing, the sows are fed much heavier. The whole process is set forth in the following table:—

Dec. 1 to April 1—121 days	
2 lbs. of meal per day @ $50.00 per ton (121 days)	6.05
20 lbs. of mangels per day @ 12c per bushel (121 days)	4.84
April 1 to May 11—6 weeks	
8 lbs. of meal per day @ $50.00 per ton (42 days)	8.40
20 lbs. of skim milk per day @ 25c per cwt. (42 days)	2.10
20 lbs. of mangels per day @ 12c per bushel (42 days)	1.00
	$24.07

This may be regarded as an extreme figure, averaging as it does about $4.40 per month. Before the war there were those who claimed to have fed sows at from $1.00 to $1.50 per month, and even lower figures were quoted when skim milk, garbage and other waste material was used. Now for the returns.

An average sow will raise 8 pigs and frequently 10 to 12. Sucking pigs will sell next Spring at $5.00 or more a piece, which means a gross return from the sow of at least $40.00 to be set against a cost of $24.00 for maintenance. The sow herself will be worth as much as when the feeding began. No further figures are necessary to indicate profits to be derived from keeping sows, even with feeds at the present unheard of prices. Possibly some may doubt the market for young pigs next Spring relatives to which we should point out that the "Keep a Pig" movement, like the "Town Garden" movement of last Spring is sure to interest hundreds of suburban dwellers in feeding pigs next year, and this demand added to the normal demand promises a bigger sale for young pigs than the total available supply.

This is the business side of the story. There is no need to dwell on the patriotic, except to briefly state that the "Hog Line" offers the quickest route to making up for the tremendous shortage in meat supplies, which is now one of the most critical features of the war. For further particulars read the advertisement elsewhere inserted jointly by the Dominion and Provincial Department of Agriculture.

NOVA SCOTIA DAIRYMEN MEET

The dairymen of Nova Scotia should note with interest the ad. in a separate column, of the 5th Annual Convention of the Dairymen's Association to be held at Truro. One of the principal features in connection with this will be the results of the Butter Scoring Competition which was held among the creameries during the past season. In this Competition each creamery sent a box of butter to Halifax during each of the five summer months. This butter will all be on exhibition at the Convention, and just previous to the Convention will be scored separately by three judges and the average of the three taken as the official score. A discussion will take place on the quality of the butter to be led by D. J. Cameron, of the Dairy and Cold Storage Division, Ottawa, who will act as one of the judges and also deliver an address before the Convention. Mr. Cameron is one of the ablest butter jurges in the Dominion of Canada and it will be of educational value to everyone interested to have the opportunity of discussing these matters with him.

SCRAP METAL ON THE FARM

Farmers may not realize that they are unpatriotic if they are not selling their worn-out machinery and implements.

Large quantities of iron and steel are needed for guns, shels, bridges and other war purposes. There are many farms on which a good deal of junk is to be found. Higher prices are being paid for scrap metal than formerly, but, in order to save unnecssary expense in getting it to the foundries, neighboring farmers might co-operate and make one hauling do instead of several.

GRADE UP THE DAIRY HERD

Malcolm H. Gardner, Superintendent of American Advanced Registry, makes the surprising statement that there are 5,000,000 unprofitable cows in the United States. This is one-fourth of all the cows in the country. He figures that if it were possible to cut out and save the care and feeding expenses of these unprofitable cows, the saving would amount to at least $100,000,000 a year. This is a vast sum to be wasted, for it has been proven that it is possible to pick out the boarder cows. The man who keeps animals of this character in his herd is doing so either because he wishes to or because he is not sufficiently interested to take the trouble to cull them out.

It would not be possible to eliminate all the unprofitable cows at one stroke, as there are not enough good ones to take their places, although it might in many cases be better for the farmer not to keep cows, rather than keep the ones htat lose him money. The process of elimination must of necessity be gradual, a weeding out and a grading up. By the use of better sires and the selection and use of the cows and heifers that produce sufficient to more than pay for their feed and keep an increase in the yearly income from the dairy herd will become evident. Such a process of breeding and selection should go on in every herd. If more attention were given to this subject by cow owners, there would be more profit in daeirying.

The work carried out in the Maritime Provinces by Messrs. Harvey Mitchell, H. N. Flewelling, Harry Brown and others, under the auspices of The Canadian Cow Testing Association, is bringing results. Through their efforts many of our dairymen are becoming more and more interested in the upbuilding of their herds and the increasing of their average production.

The slackers must go. We know of no new New Year resolution that would mean more dollars and cents to our dairymen than the elimination of the boarder cow as per the verdict placed upon her by the Cow Testing Association.

TO SAVE NEW BRUNSWICK FORESTS BY NEW FOREST SERVICE

The chief power behind the circulating dollar in New Brunswick is the productive forest. To reduce the umber cut automatically reduces the amount of money that is available for everyday business. It also means the reduction of provincial revenues, and the amount thus forfeited, would have to be raised by other kinds of public taxes. Employment likewise would take a permanent slump from which nothing could revive it.

In order to keep New Brunswick's forests contributing their utmost in money and employment, n thriving towns and busy industries, a movement is under way to have the Provincial Government reorganize the system of fire protection on all the timber lands. Fire has robbed New Brunswick of vast quantities of timber, from which no citizen derived a penny of benefit nor a day's employment. The plan proposed by the Chief Forester and strongly supported by public bodies such as the Commission of Conservation and the Canadian Forestry Association, is to establish a system of fire districts, each in charge of a competent forester. Instead of locally-controlled fire wardens, as at present, there would be a centrally-controlled body of skilled men, under constant supervision of discipline. Such a system of fire rangers has been proved as the only workable and economical plan for Quebec, British Columbia and Ontario.

The rangers would perform their duties according to schedule, giving close account of their time, distances covered, fires encountered, fire damage, etc. They would be assisted by observation towers, telephone lines and other necessary aids in controlling outbreaks of fire. To encourage the best rangers to remain with the Forest Service from year to year, the Chief Forester plans to utilize them for supervision of the cutting in fall and winter. This involves a new departure for New Brunswick. It means that the Government would have much more thorough oversight of the quantities of logs cut on licensed lands and could make some provision for the more careful treatment of the forest by jobbers.

A feature of the plan of Forest Service reorganization, now being considered by the Government is that with very little more than the present expenditure, New Brunswick can have a well-organized Forest Service second to none in Canada.

THE MEAT SHORTAGE

Word comes from Europe to the Department of Agriculture that the fat shortage among the allied nations is becoming acute. The situation in France is very critical—each month sees a still further depletion in the already limited supply. Mr. Hanna, Food Controller of Canada, says the speediest way to relieve the fat shortage is to greatly increase the production of hogs.

This is sound logical advice. Swine are prolific and grow to marketable size more quickly than any other kind of livestock. One brood sow will produce from 1500 to 2000 pounds of dressed pork in one year. Hence one is justified in making the statement that we must look to the brood sow to solve the meat and fat shortage.

New Brunswick, always a big importer of feeds, has harvested a very small crop of grain this year. Weather conditions were unfavorable —hence the feed shortage is worse than ever. Thus it may seem unadvisable to advocate the keeping of more brood sows under existing circumstances. However the present scarcity of fats warrants us in making every effort to increase pork production in New Brunswick. Numbers of people could partly winter a sow on the garbage and kitchen refuse from the house. It is to those farmers and people who are not wintering a sow and to those farmers and people who could carry an extra sow that this appeal is directed. The monetary return, aside from the patriotic issue involved, may be large or small according to how much feed has to be purchased. With pork ruling at 25 cents a pound it would seem that money invested in a brood sow should prove a fairly attractive proposition.

Regarding the feed shortage and importation of feed—no feed can be exported from Canada until Canadian buyers have had a chance to bid on it, e. g. the New Brunswick Department of Agriculture was given an option on a certain number of cars of feed at a fixed price. As many car loads as possible were placed by the Department and on December 8th the option went out of effect. Other options on other lots of feed will undoubtedly be offered to us. The Department takes orders in straight car lots. Few farmers would require a whole car load but a group of farmers could unite and handle a car load.

The seriousness of the meat shortage has been placed before you, likewise a means of meeting the feed scarcity. Action is necessary. Winter a brood sow.

INTERESTING THE YOUNG PEOPLE

How rapidly educational work of an agricultural nature is spreading among our young people. It is vastly different to be a boy or girl on the farm to-day than it was ten or fifteen years ago. In those days there were no boys' and girls' clubs, no school fairs, no banks sufficiently interested in farming to loan any money to a boy or girl to buy a pig or a calf. None of these things were thought of.

But to-day it is a real joy to live in a farming district where the boys and girls have a place in community life. It is quite proper nowadays for boys and girls to own a pig, calf or colt. Such ownership is doubly prized and doubly interesting. Apart altogether from the satisfaction of owning something of their very own, young people are constantly enthused in anticipation of the day when their possessions are to be pitted in competition with othr boys and girls at the school fair. Here the highest principles of friendly competition are installed into the young mind, and he or she is inspired to accomplish the best possible when standards are set by this method.

And what may we expect from this awakening of educationists to a reaization of the possibilities for agricultural betterment through our young people? We may confidently hope for a more enlightened and more contented future generation on the farm. We may also hope that the interest of the coming generation will be keenly directed toward the production of better poultry, better live stock, better grain, and in better farming generally. The impressions made on the young mind are much more indelible than those inprinted on the old. If the above is accomplished in any measure, the work undertaken will be well worth while. We have been altogether too long in awakening to the fruitful field for education offered by the boys and girls. Now that it is begun let it go on with the fullest measure of support from all.

* * *

The term nervous temperament s used to refer to the ability of the cow to use a great amount of food without wasted energy. It is this nervous temperament that enables good cows to convert every available ounce of food into energy, or milk and butterfat, while other cows would waste energy because conditions under which they are housed, cared for or milked are not absolutely ideal and suited to their individual tastes.

HORTICULTURE

THE RELATION OF FOOD TO THE WINTERING OF BEES

In warmer climatesnot blessed with as severe, cold winters, where bees can enjoy frequent flights, it matters very little what the food is as long as it is there in abundance. Even honey dew that would cause dysentery before spring, in northern bee colonies, will answer as food. In these milder climates little or no protection is needed, but in higher latitudes chaff packed hives or warm, well ventilated cellars are necessary and there must be some care exercised in regard to food. It has been asserted by some writers that "honey is the natural food of bees anl nothing is gained by substituting something else." It must be remembered that the "natural home" of the bee is that of a warm climate, where there are no long spells of confinement caused by continued cold.

Honey, of course, is the "natural" food, but this does not prevent their dying osmetimes as a result of its consumption, when a diet of cane sugar would have saved their lives. In my opinion, food is the pivotal point upon which turns the wintering of bees in our nothern states.

"Food is the fulsrum and temperature the long end of the lever"' said one of the foremost of bee writers, and I believe he was right. The whole question in a nut shell is just this: The loss of bees in winter, aside from that caused by bee dysentery, is not worth mentioning. It is this that causes the most of our bee losses in Maine, whether in the cellar or out-of-doors, and we should well investigate the cause. An overloading of the intestines, with no opportunity of emptying them; cold confines the bees to the hive; the greater the cold, the larger are quantities of food consumed to keep up the animal heat; the more food there is consumed, the sooner are the intestines overloaded.

A monment's reflection will convince one that the character of the food consumed ha an effect upon the accumulation in the intestines. In the digestion of cane sugar, there is said to be very little residue or waste foreign matter. Honey is usually quite free from nitrogenous matter, being well supplied with oxygen, and a very good and safe winter food if gathered early and properly ripened, although not as good as properly prepared sugar syrup made from good granulated sugar, free from any admixture or aduteration. There has been sold a granulated sugar having a bluish tinge, which has not been found a safe food for bees in confinement, but we have always found the granulated sugar from the Forest City sugar refinery a safe winter food. Honey often contains floating grains of polen which is not good for bees in winter. · Sugar syrup never contains nitrogen, but more oxygen or heat producing producing matter, which is just what is needed in our cold climate.

The excreta from diarrhetic bees has been found ao be composed almost wholly of pollen grains in a digested or partly digested state, with slight traces of organic matter. What overloads the intestines of bees and is the greatest contributing cause of bee diarrhoea or dysentery is this organis matter combined with the larger amount of the nitrogenous matter, either as grains of pollen flotanig in honey, or by their eating the bee bread itself. Repeated experiments have proved beyond a doubt that as a winter food for bees cane sugar has no superior.

With this as an exclusive diet, bees never die with dysentery, and if kept in quiet and darkness and in a temperature ranging from 40 to 45 degrees, other things being quite right, they are all but certain to winter successfully. The temperature can only be perfectly controlled of course in a dry, frost-proof cellar, although we have wintered well in a rather damp one. Other things being quite right, what are these other things that I have mentioned::

First, a strong colony of young bees, bees hatched in August and September; bees that are allowed to become queenless at swarming time and kept so from neglect to provide a queen until late in the season, go into winter quarters with old bees nearly ready to slip their mortal coil and do so long before spring; their vitality to stand the winter's cold is very little, and the quality or quantity of the food cuts a very small figure in this matter, whether good or poor.

Second, bees bred from vigorous stock. Will our wise and progressive dairymen breed from an animal small, undersized, with a noticeable lack of vigor? Not if they know it. They select vigor as one of the first requisites. So should we, especially in Maine. Breed from those queens that produce colonies that winter best, and secondly, those that produce the most honey; for production amouns to nothing if we cannot succeed in wintering the colony. We cannot afford to buy new colonies every spring. This being the case, the question naturally follows, why not take away the honey in the fall and feed the bees sugar in the place of it? But the objections are these: Every pound of sugar fed puts a pound of honey on the market, but this ought not to weigh so heavily against the almost certainty of wintering the bees safely. Neither need there be any labor of extracting the honey in the fall if comb honey is raised mainly and supers given as soon as clover opens and the bees are induced to enter them, for most of the clover crop will be tsored there and afterwards the colony can be given a super of drawn comb, until the fall crop is over with, they then can be extracted and sugar syrup fed in its place. I have not space at this time to speak of the way it should be done, but will do this later, but I will say that a reckless ertracting of broad frames in late fall by the inexperienced has often been the cause of losses and heavy losses. Replacing honey stores with sugar syrup stores must be done properly to be a success.

The present price of sugar is prohibitive, but the price of honey is rapidly rising and there is no doubt in my mind that the business of producing honey is going to be a good one from now on. The price of sugar will seek a level with other commodities in time, and then we may feed it to our bees for winter stores, and extract and sell our honey at a profit and winter our bees safely on sugar. We have in the past wintered from 50 to 100 or more colonies with practically no loss, and it can be done by anyone who cares to take the trouble to learn the proper way to do it. Extracted honey is being shipped to Europe in large quantities for the use of the soldiers, as its virtues for their use are becoming known, and there will be a greater demand for it. I predict, after this war is over.

Extracted honey is easiest to raise both for the bees and their owners, and the easiest and most sensible way to present it to the public, and I hope to live to see the day that it will be in the greatest demand; and if there are fussy people that must have indigestible wax to eat with honey, perhaps we may conclude to present them with a sheet of it along with every bottle of extracted honey sold, to nibble along with the honey. It would be as well for them and better for us, the producers. What do other beekeepers think?

I never see a handsome case of ocmb honey (and I admit that looks well) without thinking of how much extra work has been done by the bees and their owner to get it in that form. Only extracted honey can be shipped and the price will be high. At the present price of sugar, it does not pay to replace honey with sugar for market purposes, but for wintering we have found it the safest food.—E.N.S.

PLOWING THE GARDEN

Early plowing is necessary for an early garden. Land plowed in the fall will dry quicker and be ready to plant sooner than spring-plowed land. The fall-plowed garden should be left in the furrow slice unworked, because this rough surface will catch the winter rain and let the water soak into the subsoil below; more soil moisture is stored; more of the surface soil finds its way into the openings in the subsoil, thus loosening and ameliorating the latter. The higher masses of surface soil granulate under the influence of alternate freezing and thawing and sun and rain. If a garden is forked or spaded no attempt sould be made to level it.

If subsoiling is desirable it should be done in the fall. Usually at this season the subsoil is yet wet, and therefore will not be puddled by handling. Winter freezing mellows and disintgrates the subsoil. Leaves or similar loosening material to be worked into the soil are more plentiful in autnmn. This fall working also gives the soil time to settle before spring planting. Soil worked deep in the psirn, leaving an opening below, may dry out badly, especially if much coarse organic matter is worked in shortly before planting.

During the first sunny days of early spring the rough surface of fall-turned land dries and flocculates. It is in condition to work down and be planted early. On the other hand, land which lies unturned, smooth and fiat udring a wet winter has no dry flocculent surface, and remains too wet to handle until late.—[Dr. J. C. Whitten, Misouri.

GARDEN AND ORCHARD

A Winter Garden iin the Cellar

If you have a warm cellar you can grow fresh vegetables all winter. It is particularly easy to grow rhubarb in the cellar and to provide enough for pies at a season when they will be greatly appreciated. Asparagus is forced almost as easily, while dandelions endive and horse radish may be grown without much trouble.

Perhaps it is tbest to experiment with rhubarb if one feels a little doubtful about the success of a cellar garden. Rhubarb roots are plentiful and cheap, but it is as well to use only those which are at least three years old. Usually they can be obtained in the home garden or in the garden of a neighbor, but if not, a seedsman or nurseryman will provide several clumps at small expense.

Freeze Rhubarb Roots

When the roots come from the garden they must be dug before the ground freezes, although they are not to be forced until they have been well frozen. It is difficult to dig them after the ground has become frozen, of course, but they should be left on top of the ground until the frost has pentrate them. Then they will keep safely until the time to start them into growth arrives. As a rule, they do not force well until after January 1st.

The plants may be set on the cellar bottom or in boxes and commonly are simply covered with two inches of sand, the latter being kept moist at all times. Quicker results are secured if a layer of fresh horse manure is placed under the clumps and covered with two or three inches of loam, so that the roots will not be burned. A foot apart is the right distance to set the clumps.

Rhubarb forced in this way is best grown in the dark for which reason it is well to hang a curtain over the window or across a corner of the cellar, or to partition off one end. Of course, only a little room is needed. Two or three months will be repuired to produce a crop and the stalks will be almost white, with but little leaf growth, and of delicious flavor.

Don't Allow the Roots to Freeze

Similar methods are to be followed when asparagus is forced in the cellar, except that the roots must not be allowed to freeze. They may be kept in a cool place, however, and a few forced at a time. Plants from the garden or the fields of professional growers may be used if they are not at least three years old. Scedsmen sell plants designed especially for forcing.

The roots are to be grown in the dark, like those of rhubarb, and should be set close together, but not crowded, with ordinary soil worked around them so that all the spaces are fille. Asparagus comes along rather quickly, and often may be eaten in six or seven weeks from the time forcing begins.

For all vegetables grown in the dark a temperature of from 50 to 65 degrees will be about right. In many furnace heated cellars there will be difficulty about the temperature, but sometimes it may be necessary to provide a little extra heat, which is easily accomplished by hanging one or two lighted lanterns in the cellar, but first the glass must be painted black, so that no lght wll be emtted.

There are other vegetables which may be grown in the kitchen in full sunlight during the winter months. A little bunch of parsley potted and given a sunny window will furnish flavor for many a savory dish. Sage may also be grown in pots. Cress is easily grown in a box set in the window and a few seeds will give plants large enough to use in a few days. Chives may be forced in the same way sa that there may be no lack of fresh green stuff, even when the ground outside is piled high with snow.—[E. I. Farrington.]

GARDEN REDUCES LIVING EXPENSES

The garden is the quickest and best means of reducing the cost of living. Present food prices can best be reduced by growing a new supply of food. It will take several months to produce a surplus of many food products such as meat, potatces and flour. Furthermore, the effect of this surplus on the price which the consumer has to pay is doubtful. By planting a garden the consumer can relieve the food shortage directly in a few weeks. He can substitute his fresh garden vegetables for canned products and for many of the high priced staples.

The earliest garden crops are those which thrive in cool weather and which are more or less frost resistant. The first crops which may be planted are onions, peas, salsify, spinach, and parsnips. Ordinarily these may be planted in April or early May. Later, lettuce, radishes, beans, corn, etc., may be planted. Succession plantings of lettuce and radishes should be made because both have a short harvesting period. Another group of cool weather crops includes beets, carrots, cauliflower and cabbage.

CARE OF ROOTS IN STORAGE

(Experimental Farms Note)

A great many ton of mangels, turnips and carrots are lost annually by neglect after being placed in storage. Everything may be done to insure a full crop and to harvest it at the proper time in good condition, yet, if not properly looked after during the winter months, a high percentage of this crop may become a total loss. Such

NEW ROUTE TO WESTERN CANADA PROVING POPULAR

Runs Through Famous Clay Belt of New Ontario and the Cobalt Mining District

On your next trip to Western Canada, why not travel over a new route, see the wonderful land opened up in Northern Ontario by the Transcontinental Railway and gain a glimpse of Tamagami, and the Cobalt silver mining region?

You may use two famous trains on your journey without and added expense for railway fares as compared with any other route. The International Limited will carry you to Toronto, where "The National" starts on its westbound flight. "The National" sues the rails of the Grand Trunk to North Bay, the Temiskaming and Northern Ontario (Provincial Government Line) to Cochrane and the Canadian Government Railways to Winnipeg, where it links up with the Grand Trunk Pacific for all important points in Western Canada.

A pleasant daylight run to Toronto, and evening in the Queen City and "The National" is ready to carry you westward. The departure of "The National" from Toronto is 9.00 p. m. on Tuesdays, Thursdays and Saturdays. North Bay is reached early next morning and there opens up for your admiration, all the lakeland beauties of the territory served by the T. & N. O. line. These are followed by a wonderfully interesting trip through the sparsely populated territory of New Ontario, giving the traveller an opportunity of inspecting this fertile region, including the famed clay belt where tens of thousands of settlers will make their homes in the future. The area of New Ontario is 330,000 square miles, fully four times the size of Old Ontario, and, in addition to great expances of farming land, it has wonderful resources in timber, minerals, water power, fish and game.

The three railways have combined to make the passenger service over this new road the equal of that afforded anywhere on the continent. The smooth, straight and level roadbed embodies all that has been learned in three quarters of a century of railroad building. The greatest travel comfort is assured. Write J. H. Corcoran, T. P. A., G. T. R., Moncton, N. B., for further particulars.

loss con be prevented only by prompt attenton to the details of storage requirements

If a cellar is to be used for storage it should be thoroughly cleaned, the ventilators put into good working order, and thorough drainage and portection from frost assured some time before it is filled. Usually in filling cellars it is customary to dump the roots down through a trap door in the floor above, or roll them in over a shoot from windows at the ground level. No matter how much care is exercised in the performance of either of these operations, there is bound to be accumulations of broken and bruised roots and earth at the end of the shoots, or beneath the trap doors. Unless frozen, the broken and badly bruised roots, in such a mixture, will invariably rot and by so doing enerate heat that will help to spread the infection to the surrounding sound roots. It s therefore obvious that accumulations of this nature should be thoroughly cleaned out as soon as possible after the harvest has been completed, and the damaged roots fed before they have had a chance to decay.

Frequently, during the winter months, rotting will start among apparently soound roots, usually as the result of an unsound root becoming buried among the others. Infection spreads rapidly among roots in storage, and all such infected areas should be thoroughly cleaned out whenever detected

All classes of roots lose a certain amount of moisture soon after harvest by evaporation or, as is commonly called, sweating. If an adequate ciculation of air among the roots has not been provided for, this moisture will condense and wet places will be formed which will favour this growth of moulds, and other plant life, which may directly, or indirectly, cause rotting. It is, therefore, imperative that during the first few weeks of storage, and in fact whenever the outside weather permits, thorough ventilation be maintained.

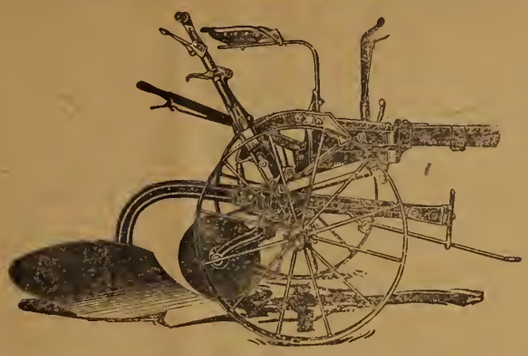
The temperature in the cellar should be such that the roots will neith ergrow to any appreciable extent, nor yet freeze From freezing to 40 degrees F. may be considered as the extreme range. It is an excellent plan to hang a thermometer in a convenient place in the cellar and consult it daily. If the temperature is above 38 degrees F. the ventilators should be opened and, when it drops sufficiently, closed. When the warmer weather of spring and early summer has set in it is advisable to keep the ventilators closed during the day and open during the night, so as to admit only cool air, thus keeping the cellar cool as long os possible.

If the roots are to be pitted outside it is essential that thorough drainage is assured, either by choosing a location on sloping or sandy land, or by providing artificial drainage.

After the roots have been piled and the ventilators inserted, the pile should be covered only with straw to a depth of about eight inches. Later in the season, when cooler weather has set in, about 4 inches of earth should be placed over the straw. Still later, when this earth has become frozen to a depth of about two inches, another covering of straw and earth should be made. When cold weather has finally set in the ventilators should be plugged with straw.

If the pit has been properly constructed and covered correctly there is littledanger of the roots rotting. As a precaution, however, it is advisable to hang a thermometer in every second ventilator and to consult it occasionally. If the temperature in the pit gets higher than 45 degrees F. it is evident that heating is taking place and the pit should be opened up and the infected area thoroughly cleaned out.

In the spring the layers of covering should be gradually removed, the ventilators opened and, generally speaking, the portection modified to suit the rising temperature.



LET YOUR PLOW BE AN OLIVER

Take a simple type of two-wheeled sulky plow like the **OLIVER 26**, equip it with a suitable bottom, put it into the hands of an Eastern Canadian plowman, and you'll see a good job of plowing.

The **OLIVER 26** sulky handles like a two-wheeled cart. It has a pole shift that changes instantly the landing of the beam, making it easy for the operator to straighten crooked furrows, to turn short corners, or to plow side hills. The land wheel has a range of lift that insures good work on rough ground, around dead furrows, and in finishing out a land. No plow made works better on rough, uneven land or can be backed more easily. It has a horse lift that eases the work of the plowman without tiring the horses.

Other **OLIVER** plows from tractor and riding gangs down to walking plows, complete a line in which you can find any plow you may need at a price you can afford to pay. May we send you our folders telling all about **OLIVER** plows for Eastern Canada? Write to the nearest branch house.

Eureka Potato Planter

Pays for Itself in Labor and Time Saved

One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.

Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. **Furrow opens and seed drops in plain sight**—an equal distance apart, at uniform depth, with **absolutely no injury to seed.** Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.

Write for **free** catalog on this great line of potato planters—the largest line made. 3 sizes, 1 or 2 rows, with or without fertilizer attachment. **In Stock Near You.** A success for over 19 years. Whether you are a large or small grower—**write today.**

Saskatchewan—Harry Follett. Duval. Sask.

Alberta—E. W. Bjorkeland, Red Deer, Alta.

British Columbia—Dr. S. F. Tolmie, Victoria. B. C.

W. A. Clemons.
Secretary.

WHY BE A DAIRYMAN ?

Dairy farming is a growing business. There is a wide-spread tendency for large beef ranches and grain farms to be sub-divided into smaller and more intensive dairy farms. Why is this the case and what are the reasons which draw men into dairying?

In any business the owner must look to the profits. In the dairy farming business the profits may come from four sources. The fiirst and least evident of these profits are those due to the increased soil fertility but it counts as much or more than any other. Many fields have been cleared and then cropped continuously until the diminishing returns per acre have sounded the warning. One farmer had a thirty-five acre field which had been "farmed to death" producing less than twenty bushels of corn per acre in a good season. Hauling out manure and rotating with clover built up the fertility until some years later. he obtained sixty to eighty-five bushels per acre. according to the season and in some parts of the field the yield went as high as ninety bushels. To estimate the money value of the fertility phase of dairying. the farmer should very largely credit the dairy herd with the increase in the crops per acre.

A second and more tangible source of profits is in the sale of the dairy products. Selling cream and feeding the skim milk to young stock and poultry is probably the most profitable combination in dairying, unless a particularly good market for milk is available. Many practical and scientific experiments have proven that calves and pigs will thrive on warm, sweet, undiluted skim milk. nearly as well as an whole milk. especially when the skim milk is supplemented by a small quantity of grain. For feeding pigs. 100 pounds of skim milk is worth about as mush as one-half the market price of a bushel of corn. One dairy farmer's cream checks for a year totalled $1900.15 and deducting the cost of feed. which was $950.00, left an income of $950.15 without adding the feeding value of the skim milk to calves and pigs.

The breeding and maturing of good dairy cows is the third source of profit. Good cows are valuable, not only to fill vacancies in the home herd but they also find a ready sale to other dairymen. Very often. they can be sold at private sale as foudation stock for some new herd.

The sale of a cash crop from the dairy farm makes a fourth source of profit possible, without the usual decrease in soil fertility. since the manure. rich in plant food. from the dairy herd balances the sale of the fertility constituents of the crop.

Another advantage which attracts men to dairying is the utilization of non-tillable land as pasture ; kaste land which may afford good pasture to dairy cows, but which cannot be tilled and made to render a crop income. Land in pasture is not subject to "washing out" as much as plowed land.

The conversion of bulky crops such as hay. grain and roots into the more easily marketed products such as milk, cream. cheese and butter. effects a great saving in the transportation and handling of such crops. Constant employment of farm labor. producing crops in the spring and summer and feeding these crops in the fall and winter. makes it possible to hold steady help throughout the year. Unifform and regular returns coming periodically to the dairyman gives him cash for ready capital to meet his family and labor needs. The dairyman is able to pay as he goes and to take advantage of cash prices due to this "cash on hand."

Good profits. building up the soil. less transportation. year around employment of labor, and the cash weekly or monthly returns are some of the advantages which make dairymen from beef or grain farmers.—R. A. Lamson. Purdue University.

SEX CONTROL

On Oct. 24. Dr. C. D. Woods of the Maine Agricultural Experiment Station issued the following bulletin:

No Known Way to Control the Sex Ratio in Cattle

Any method of breeding which would tend to increase the proportionate number of heifer calves is of the utmost importance. There seems to be a pretty general feeling among brooders that the proportion of heifer calves may be influenced by regarding the time in the heat period at which the cow is served. There is difference of opinion. however. as to how such control is to be gained. On inquiring among about 200 of the best breeders in the state, it was found that 42% breed early in heat. and 27% breed late in heat. A few data gathered by the Maine Agricultural Experiment Station 25 years ago indicated that there was a possibility of influencing the sex ratio by paying attention to the time of service. The subject aws believed to be of such supreme importance as to justify the careful study of the matter on the basis of extended statistics.

Summarized results of 1313 separate and distinct matings show that there is no practical relation between the time in the heat period which the cow is served and the sex of the offspring. In each one of the cases the facts were accurately known and reported in such a way that any bias conscious or unconscious. of the observer could not have influenced the result. Out of the more than 1300 matings. about 50% of the calves were males, whether their mothers were served early in the heat period. at the middle of the heat period. or late in the heat period. The results of these studies make it evident that there is no significant preponderance of the females when service is early in heat. The apparent relation between thse two factors, which is believed by many breeders to exist. and which earlier statistics at the Maine Agricultural Station appeared to indicate. seems now to be purely accidental, and to have arisen only because of the comparative meagreness of the statistics on which the matter was discussed. There is no known method by which the sex ratio or proportion of sexes in cattle may be effectively controlled by the breeder.

To this bulletin. S. S. Perkins of Durham takes exceptions, as evidenced by the following letter sent to the Lewiston Journal:

In regard to the controlling of sex in breeding cattle. I will say that I think I hve overcome the obstacle. We have been trying for the last four years a plan that has given us heifer calves at will. and bull calves from such cows as we thought best, at our will.

When 1 read Dr. Woods' report of the plan he had mapped out for the 256 farmers of the state to report on. and not a single one had a favorable report to make. I could not help saying Eureka! For the plan we have been following has not failed us in a single instance, and we have the

WHEN YOU CAN'T SLEEP

Dr. Cassell's Tablets will sooth the Nerve Restlessness that causes Insomnia, and ensure rest.

Sleepless nights mean overstrained nerves—nerves that are always shaky because they are always weak. That is why you cannot sleep. The remedy is to nourish your nervous system, and so build up new vigour and vitality, by taking Dr. Cassell's Tablets. Then you will sleep naturally and healthfully, and wake refreshed. Dr. Cassell's Tablets are true restoratives. They act by restoring the vital power of the system, by promoting digestion by enriching the blood, by strengthening every bodily organ. And there is no dope in them.

A free sample of Dr. Cassell's Tablets will be sent to you on receipt of 5 cents for mailing and packing. Address Harold F. Ritchie and Co., Ltd., 10, M'Caul-street, Toronto.

Dr. Cassell's Tablets are the supreme remedy for Dyspepsia, Kidney Troubles, Sleeplessness, Anaemia, Nervous ailments, and Nerve paralysis, and for weakness in children. Specially valuable for nursing mothers and during the critical periods of life. Price 50 cents per tube, six tubes for the price of five, from Druggists and Storekeepers throughout Canada. Don't waste your money on imitations; get the genuine Dr. Cassell's Tablets.

heifer calves to show or it.

Our plan is one that we thought was right, and that is in regard to sex of the ovary. We think that the ovary must be a male or a female one at the beginning, and it can't alter the sex, no difference what time of service.

So we keep a record of the sex of the last calf a cow has, and the next heat of the cow will be the opposite sex of the last one. So by keeping a strict record of heats, we are able to control the sex of the calf. That the ovaries are either male or female, so we are sure if we serve on a male heat we shall get a male calf; and if a female heat a female calf.

Our experience has been such that we are sure of the right results. Hope this may bring out some argument on the subject.

FEEDING THE CALF

The average man makes a mighty poor "wet nurse" for a calf. Too often he seems to think that the calf should be as hungry as possible at feeding time so that it will take a hearty meal. For that reason he lets it have but two big drinks of milk, inght and morning.

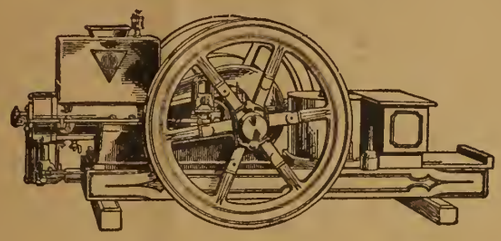
That is a wrong and unnatural way of feeding a young calf. Watch nature's plan. The youngster takes a suck or two o fmilk at frequent intervals, changing teats now and then and often kneading the udder with its head. Note that it sucks the milk instead of drinking it, and sucking is a comparatively slow process. On the contrary, when the calf is fed by hand the man who arrives with the pail of milk is usually in a big hurry, and so makes the calf hurry up the drinking process as much as possible; then he wonders why the calf suffrs from indigestion, or at least fails to thrive.

What a difference there is in the appearance of the hand-fed calf, raised on the plan we have outlined, and the suckling calf at six weeks of age! Thedifference surely is an argument in favor of the natural plan of feeding. The natural plan gives the better results for the reason that the milk is sucked in small quantities, so slowly that it mixes at every swallow with the saliva poured into the mouth during the operation. The saliva renders the milk alkaline and properly prepares it for the fourth stomach which contains the ferment (rennin, of rennte) that curdles the milk. When a calf drinks fast the milk is swallowed without the addition of the necessary amount of saliva and entering the fourth stomach, is quickly coagulated into a tough curd which cannot be easly digested by the calf, is the natural cnsequence. The calf may scour acutely and die, or suffer from less acute chronic scouring and fail to thrive. Or it may suffer from a sudden acute attack of indigestion characterized by a fatal fit or convulsion; or it may show no severe symptoms, but fail to grow and look as weel as it shoudl do or would do if properly fed.

The lesson from all this is that it would be better, if possible, to have a woman do the calf feeding. If that cannot be managed, then have it done by a mature, careful person, as young children do not understand the importance of careful feeding. Then try to feed milk at least three times a day, instead of twice, and from a self-feeder, which will make sucking unnecessary. If that cannot be done, then make the calf drink slowly and keep it stanchiond for some time after feeding. This alone will prevent a great many cases of severe indigestion, and most of the chronic indigestion so common among hand fed calves.

Next remember that the fourth stomach, or true digestive stomach (abomasum), is the only one ready in the young calf to digest or care for food. The first stomach (paunch or ruinen) is undeveloped at first and cannot care for roughage. It therefore is a serious mistake to make the calf eat coarse fodders too early, in place of feeding sufficient milk and easily digested meals which go almost directly into the fourth stomach. The calf fed on roughage becomes potbellied and stunted, and the growth which should be made during calfhood if not made then, cannot be attained later. The proper feeding and developing of the young heifer calf really is more important work than the feeding of the adult dairy cow.

ALPHA



—the engine that takes the work out of farmwork

An Alpha will saw more wood in a day than you can saw by hand in a week.

It will pump water all day long without watching.

It will run your separator, churn or washing machine.

It will run a thresher, feed cutter, or silo filler.

There will not be a day when you cannot find some way in which your Alpha will save time, money and labor for you.

Owning an Alpha is cheaper than hiring someone else's engine. The money you now have to pay out for engine hire when you need power, and the greater amount of work you could do if you had an engine of your own would soon pay the cost of an Alpha.

The Alpha is a simple, powerful engine that will give you more reliable service and cause you less trouble than any other engine you can buy.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

MONTREAL PETERBORO WINNIPEG VANCOUVER

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

WAS IT THE COW'S FAULT?

Supposing that you keep a cow giving five thousand pounds of milk in a year, for which you receive $70 cash, how much profit does that cow make? This is not a riddle, but simply a query that every dairyman should be in a position to answer. Leaving aside the "higher accounting" side of revenue and expenses per cow — those persistent items of rent, interest, taxes, depreciation, etc.—and taking only income from milk or fat, and cost of feed, are you then in a position to say definitely that each cow you keep does make a good clear profit above fee cost?

Whether the feed is valued at $40 or $80, whether the income is $50 or $120, is there such profit that a fair return is made to you for the labor expended? For if revenue and expense just balance, showing no margin of ppofit at all, there must surely be something wrong, your labor has to be paid for.

PULVERIZED LIMESTONE

SWEETENS THE LAND AND PRODUCES HEAVY CROPS

The demand last season for our "Clairmont" Brand Pulverized Limestone was so heavy we were unable to fill a great many orders. We expect a very heavy business for 1918 and would advise all booking now and getting their supply early. Our Limestone is showing wonderful results.

THE CARE OF EWES IN WINTER

(By Professor THOMAS SHAW.)

When caring for ewes in winter on the arable farm, much depends on the weather conditions that prevail in the locality. In some areas where the snowfall is light and the ground is bare much of the season, the flock will gather a large part of its food in the fields, if allowed to do so, and suc liberty should certainly be given to it, not only as a matter of economy with reference to food, but as a matter of healthfulness for the sheep, and more especially for the healthfulness of the lambs when born. There is probably no one influence which tends so much to the production of weak lambs as lack of exercise in the dams. When ewes are confined to padlocks for long periods in Winter, as they sometimes are, where the snowfall is deep, it is almost a foregone conclusion that there will be trouble with the lambs at the lambing season. They will probably be over-large, but lacking in vitality. When goitre is present, it will be in an unusually aggravated form, so much so that some of the lambs may die at birth from the large swellings that appear in the throat.

In areas of deep snowfall, one of the most difficult problems of the stockmen is to secure ample exercise for the ewes. To encourage them to take such exercise the owners sometimes open up a track with a snowplow to some distant feeding ground, in which food is fed and to which they have access daily save in time of severe storms. The Northwest is but little subject to such snows, save on the mountains, hence the encouragement of artificial exercise is not a problem with them. Shepherds, notwithstanding, should allow the sheep to roam over the fields even when they may not be able to get much food. They will be greatly benefited by the exercise.

Another matter of great importance is to see to it that they are not confined in sheds over night where the ventilation is deficient. Such treatment is deplorably bad. They breathe impure air. They become overheated. When liberated in the morning, they go out betimes into a cold atmosphere. The sudden change produces colds and catarrhal troubles accompanied by more or less severe coughing, all of which is more or less harmful to the flock. To give them the liberty of a shed is far preferable, even though it be open in front and allowing them, if they care to do so, to lie out in the open in a well-bedded and dry yard. Oftentimes they will choose the yard in preference to the shed in which to sleep and they are certainly the best judges of where they can secur ethe greatest comfort while resting. The great consideration in providing suitable Winter quarters for sheep are to have them protected from winds and air currents in the form of draughts, to have them dry, that is, free from moisture influences coming from below, and to ave them so that they can obtain adequate shrelter in providing against severe st orms.

With reference to food, much will depend on the time when the lambs are to come. If they are not to come until the sheep go out on Spring pastures, the flock may do fairly well on some good kind of nitrogenous hay, or alfalfa, clover, or vetch, even in the entire absence of a grain ration. Such Wintering is not costly and it woul dseem to answer quite well for ewes that are to produce their lambs on the ranges after the opening of the season for grazing. It is quite different, however, with ewes that are to produce lambs before the season of grazing. Such ewes ought to be well maintained. They should be in fairly good condition before the lambs are born in orede to nourish them properly when they come. To insure this will usually call for the feeding of some grain, if the lambs are to be properly nourished; usually, however, not more than one pound per day will be required. Almost any kind of mixture will answer, but it is well when oats or wheat bran or both form a considerable proportion of the same, and a sprinkling of oilmeal will help much. If some field roots can b efed, so much the better but before the lambing season they should not be fed in excessive quantities.

After lambs have been produced, say in the early Spring months, the ewes should be liberally fed. After the lambs have reached the age of say two or three days, they will take care of themselves. They can then stand a considerable degree of exposure and apparently without harm. As lambs that come this early are to be sold as milk lambs or at least somewhat early in the season, the ewes must be well fed. In addition to nitrogenous hay, they shrould get a liberal supply of grain. If they can have an ample supply of roots, almost any kind of the same, it will tend greatly to stimulate the milking properties of the ewes. Corn ensilage will prove a good substitute ofr roots, but it is not the equal of roots in sustaining the animals in good health. Ewes thus fed should push their lambs forward rapidly for the early market. It should also be mentioned that the fodders fed to breeding ewes are much superior when nitrogenous in character and of fine growth. Overripe timothy or over-ripe prairie grass are ill-adapted to the needs of breeding ewes in Winter.

PROFIT ON A SMALL FLOCK OF EWES

In October, 1916, a flock of 100 grade ewes were purchased at public auction from the C. P. R. Department of Natural Resources at Coaldale, Alberta. 50 Shropshire shearling ewes at $11.75 apiece and 50 Merino three-year-olds at $9.50 apiece and a pure bred Shropshire ram at $42.50 also 6 old ewes at $6.00 apiece. To this really should be added the price of a second ram as the service of one was obtained from a neighbor who was planning to lamb around six weeks or so later than were we.

Cost of Wintering

A record of the cost of wintering was not attempted as they were pastured on the stubble fields and hay meadows most of the winter The feed that was given them during the severer part of the winter was damaged hay and odds and ends of roughage that had little or no market value. The onlly class of feed given that would not be apt to be found on the ordinary farm was turnips. As we happened to have a surplus of these they were given a feed of sliced turnips daily for most of te winter. At lambing time a little grain was fed, also some hay of good quality. They were fed grain (barley and oats mixed) from time of lambing until turned out on grass. Eac one probably received about one pound of grain and two pounds of hay daily at this time.

Dogs

Te danger from dogs is very real when sheep are kept under farm conditions and usually the closer one is located to a town te greater becomes the menace. Stringent laws arranging for the destruction of dogs which are ont kep under he owners' close supervision are most commendable. The Lethbridge Station is only about three miles from the city of Lethbridge and consequently there are more stray dogs wandering about than might be the case in a farming community more remote from a large town.

One night in February the corral in which the ewes were confined at night was visited by two stray dogs. Their presence was not discovered until nearly daylight, and they succeeded in killing twelve ewes.

Lambing and Summering

The ewes started to lamb on March 25th and the 94 ewes left after the trouble from the dogs all had lambs there being 118 born and 112 of these were saved.

The ewes and lambs were turned out on grass on May 13th having been shorn May 26th the average weight of fleece being 8.5 pounds. They had the run of about 18 acres of cultivated pasture grassess on the irrigated land and in addition about si xor seven acrse around a small artificial reservoir and on the canal bank. This supplied sufficient pasture until about the end of August when the fee became rather scarce. During the summer two ewes died, and nine lambs were killed by coyotes and dogs, leaving at weaning time, Oct. 1st, 92 ewes an 103 lambs.

Financial Returns

The following gives the financial returns from the investment:

102 lambs (present		
Total cost. 106 ewes	$1,098.50	
Cost of 1 ram.....	42.50	
Cost 4300 lb. grain.	75.25	
Cost of 4½ tons hay.	40.50	
Cost of shearing....	11.40	
Wool 809 lb. @ 64c.		517.76
92 ewes present value)		1380.00
1 ram (present value)		40.00
value		918.00
Profit	1,587.76	
	$2.855.76	$2.855.76

In the above statement nothing is allowed for labor. This is an important item but will vary with the circumstances. On a farm fenced with woven wire it will be reduced to a small amount. The destruction of weeds on a farm will go a long way to compensate for the labor involved in their care.

SHEEP ARE GOOD SCAVENGERS AND WEED KILLERS

As scavengers, sheep are certainly good and for this reason alone a dozen of fifteen head of sheep might well be carried on a farm or ordinary size—say one that contains a hundred acres. Cattle in the pasture refuse to eat the weeds along the fences and here is a place where sheep come in handy, since they seem to relish the weeds almost as much as grass. Many farmers have found to their everlasting pleasure that a few sheep turned into a corn field that is weedy will soon rid the field of the weeds without doing any particular damage to the corn. Of course if the corn is about ripe, after the sheep have eaten up the ragweeds and other foreign plants in the corn field, they may tackle some of the ears of corn, but they will not do this nutil they have exhausted the supply of weeds.

In cleaning up old brush rows or pastures that are intended for beraking, sheep do excellent work since they sprout the stumps so completely that the sprouts are killed out during the first season of pasturage. The following spring this land can be broken very well.

Rotate the Pasturage

Where sheep are kept as one of the major businesses of the farm, particular attention must be paid to the pasture upon which they graze, since there seem to be a number of internal and external parasites that prey upon the wooly creatures. After sheep have pastured upon one piece of land two seasons it is high time that they were moved to the next pasture.

Another point that often comes up regarding sheep is that of shelter during the winter. When it is taken into consideration that when winter draws on the sheep have all the way from two to five inches of wool covering their backs and when we remember how warm woolen clothing is, we are in a position to know at once that the sheep do not require a very warm shelter. The most successful sheep men do not give the sheep close shelter at any time of the year, except the ewes, for a few days just at lambing time.

Dogs, no doubt, contribute some thing to the loss of sheep and whether or not there happens to be a law to to that effect I should feel perfectly free to shoot any dog that was nosing about the sheep yards. Until secure protection from dogs can be legislated through, sheep men should take precautions by building high dog-proof fences about the place where the sheep stay nights. Under present conditions however, there can be no doubt but that it will pay to take on a few sheep, but as with all other ventures, he who makes th eventure should know the limitations of his enterprise.

I. J. MATTHEWS.

CLEAN UP THE WASTE PLACES

"I would not know how to do good farming without sheep," declared George McKerrow of Wisconsin, one of the best and most widely known sheep breeders of America upon a re-

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

KIDNEYS SO BAD WOULD FAINT AWAY

THAT WAY FOR TWO YEARS.

Those who have never been troubled with kidney trouble do not know the suffering and misery which those afflicted undergo.

The dull pains, sharp pains, and quick stinges, all point to the fact that the kidneys require attention.

Doan's Kidney Pills are a specific for all kidney troubles.

Mrs. Albert Williams, Edam, Sask., writes:—"I have the greatest pleasure in telling you what Doan's Kidney Pills did for me. Ten years ago I was so bad with my kidneys that I would faint away, and could not stand to do anything. I had been that way for two years, and had done all I could, but did not get any better until one day some one put a little book in our door, and I saw how another young girl had suffered like I was then, so I thought I would try them, and I am glad to say that after taking four boxes I have never had the same thing again. Thanks to "Doan's."

When asking for "Doan's Pills" see that you get the oblong grey box with the trade mark of a "Maple Leaf." Price 50c; put up by The T. Milburn Co., Limited, Toronto, Ont.

cent visit to the Food Administration in Washington. "Why," he continued. "Because my sheep use up the wastes of the farm. They clean up the grass, weeds, brush and gleanings, and in so doing turn into cash what otherwise would be lost."

Mr. McKerrow knows sheep, and his knowledge comes from a broad experience gained in 51 years of breeding them. His is a story filled with romance, faith and devotion to an ideal that covers a span of years from the time an eight-year-old farmer lad, who had saved his pennies and nickels and bought an aged ewe, which in turn produced two ewe lambs, down to the present, when thousands of sheep "eliminate the waste" on his 2300 acres.

"Sheep," said Mr. McKerrow, "make the most economical gains of any kind of live stock, because they clean up the odds and ends. They are particularly useful on the farm in the fall of the year, for they turn into mutton the things that otherwise would not be used. At the same time, they save the feedstuffs that would be given them if they did not have access to these other things."

After harvest, Mr. McKerrow's sheep are turned into the oat fields for a few hours the first day; an hour or two longer the second day; and the time gradually increased until at the end of a week they have complete possession of the fields. The lambs are permitted to enter the corn before it is cut, and they clean up on the weeds and lower corn plant leaves. The lambs do not pull down the lower ears of corn as do the sheep. Roots are grown for the cattle and sheep on Mr. McKerrow's place, and after the larger roots are hauled into storage for winter use, and eat thet-a6 into the field and eat the smaller ones that remain. Both the sheep and lambs are turned into the aftermath of the meadows, and this brings them into winter quarters in good condition.

Another profitable practice on this farm is that of plowing up fields that become weedy after harvest. These fields are sown to rape and turnips, and later the sheep are turned in. They eat the rape and turnip tops with relish, and will later hollow the meat from the turnip, leaving but a shell.

Mr. McKerrow has found that a frequent change of pasture is beneficial to the sheep. 36-inch woven wire fence in 20-rod lengths is moved about, thus preventing the too short cropping of the grass, and, furthermore, reducing the internal parasite plague to a minimum. Water is also an important consideration, and ewes particularly should have water, the same as dairy cows.

"I would not go so far as to say that there should be some sheep on every farm," declared Mr. McKerrow, "for peculiar conditions might not make it practical, but I do believe that there should be sheep on the vast majority of farms in this country. They turn waste into cash. The sort of saving that the good housewife is making in her kitchen can be practiced with corresponding effectiveness by the use of sheep on the farm."

DETERMINING THE AGE OF SHEEP

The age of sheep can be told largely by the appearance of the permanent incisors. The sheep, like human beings, have two sets of teeth; the first set known as "milk" (temporary) teeth, being replaced by permanent teeth. When a sheep has a full set of teeth we find eight of them on its lower jaw in front, but none on the upper jaw. The temporary incisors that are characteristic of lambs are quite different from the permanent ones which begin to appear when the lamb is about one year old. The temporary incisors are uniform in size and shape, are long and narrow and constricted at the neck, and are white in color. The first pair of central permanent incisors usually make their appearance when the lamb is from twelve to fifteen months old. The next pair, that is, one on each side of the central pair, make their appearance about one year later, so that the sheep has two pairs of permanent incisors when it is a little over two years old. The third pair appears the next year, making the sheep slightly over three years old when there are three pairs of permanent incisors. The last or fourth pair, that is the corner incisors, appear when the sheep is slightly past four years old. As a rule the sheep has a "full mouth" at five years of age. We often find that the changes of teeth are somewhat irregular, varying with individuals and feed conditions. After four years of age the exact age of a sheep cannot be definitely told by its teeth. However, experienced sheepmen can guess quite closely from general appearance. With advancing age, the teeth become wider apart and, when shed, handicap the sheep greatly in grazing and feeding. After five years of age, a ewe is likely to have a broken mouth and be less thrifty on that account. Two-year-olds with their first lambs are not as reliable as older ewes, hence the commercial flock should be largely composed of ewes from three to five years old. However, in pure-bred flocks a good breeding ewe is usually kept as long as she will breed.

THE HORSE

CURING HORSE OF NERVOUSNESS

I notice a lot of people offered preventativees but none a cure in handling the mare that would run away every time she got her tail over the line. Take this mare into the yard where there is plenty of room, put a surcingle around her body and buckle one front foot up to it. Tie a rope to the halter and pass this through the surcingle on the same side on which the foot is fastened up. Now step to the head of the animal and pull on this rope, which should be about 14 feet long. The animal will turn her head to the side and gradually sink down on her knee.

When she is completely down pole her all over. This is done by using a piece of broom stock or something similar about three feet long, starting at the ears, and rubbing back over the body. If the animal appears nerous when you are rubbing any particular spot start over again and go back until she has lost this nervousness.

You will need an assistant. Let him hold the animal down while you pole her until she is thoroughly submissive. After you let her up go over her again until you can handle her at will and she will not flinch or become nervous when you are handling her tail. Possibly you may have to throw her again or repeat the process several times.

Put on an open bridle and lines and drive her around for a while and let her get the tail over the line If she still is frightened throw her again and repeat the treatment.

The next step is to hitch her up the way she has been driven, leaving the throwing apparatus on her, and if she shows the least sign of kicking pull her to her knees again. After she gets so she won't resist when her tail is over the line, take the appliances off gradually. In working her, of course the foot is not straped up, but leave an ankle strap on her so that you can pull the foot up if you want to.—E. L. Drake.

PREPARING THE HORSE FOR THE SHOW RING

In succesful showing horses of any type, there are a few points which must always be kept in mind. It is, for instance, of prime importance that the horse be fat. No matter how much individual excellence he may possess, he can never win favor in the judge's eye if he is sent into the ring in a half-fat condition.

Fat is like charity, it covers a multitude of—not sins—but faults. It fills up the low places and smooths off the rough points, and in general adds to the look of the animal—giving the impression of abundant vigor and good health. There is no secret about getting a horse fat. It just takes feed, and then more feed. Feeding a horse is an art most anyone can master, if he just keeps in mind the fact that for the best results a horse should be provided with a palatable ration made up of a variety of good clean feeds in sufficient quantities.

It is a practice with some horsemen to add eggs to the ration in order to get a fine glossy coat of hair. Eggs will, no doubt, answer the purpose but a little oil meal added to the feed will prove equally efficient and will be found to be much cheaper. The best way to secure a beautiful coat of hair is to groom well and regularly. A curry comb should have a very small part to play in teh preparation of the show horse. A good stiff brush will answer just as well, and be far easier on the horse. After a thorough brushing to loosen the dandruff and dirt, the horse should be gone over with a softer brush, or better still, a grain sack makes an excellent rub rag, or a damp wisp of hay. Nothing will add lustre to the hair more quickly than simply going over the horse with the open hand, using plenty of elbow grease.

During the time of preparatoin, keep the horse blanketed to ensure the hair staying smoot and glossy. Care should always be taken to give the horse plenty of exercise, otherwise he may go off his feed; but do not exercise him so much that he will lose the fat he has put on.

Next to good condition in the matter of flesh, nothing is a greater asset to a horse than good manners. Weeks before the show, the horse must be carefully educated in the way he is to be shown. Every day the horse should be handled exactly as he will be expected to perform in the show ring. Teach him to walk straight, square and fast; then teach him to trot in the same way, always moving with the utmost freedom, but under perfect control all the time.

If he is to be shown in halter, the attendant should always keep on the left side, and just abreast of his shoulder. The halter rein should be loosely coiled in the right hand, and held at a point about 8 or 10 inches from the bit or halter ring. A long rein must never be used, and no matter what happens, keep close to the horse's head. There is nothing more objectionable in the show ring or more distracting than to see agroom trying to control and show a horse at the end of a 15 foot leading rein.

The horse must be taught to stand perfectly quiet and to behave properly in company. It is a common practice in standing a horse to place him in a stretch. This is all right, and a horse will usually stnad more quietly in such a pose, but to force him to stand at an extreme stretch will defeat the purpose and distract from the exhibit.

If the horse is to be shown in harness, he should be exercised, but not so much as to take off the necessary fat. He should be taught to get away at his stride quickly and to make his turns easily and with plenty of dash.

After these preliminary lessons, and before he is sent into the ring, there are a lot of finishing touches which can be put on, and which will add a great deal to the attractiveness of the entry. The feet should be in good shape and a piece of emery paper may be used to smooth the hoofs. The fetlocks should be trimmed, unless the horse be of a breed where plenty of "feather" is a characteristic. The ears, too, should be trimmed, thus giving a neat and clean appearance to the whole animal.

Decorations undoubtedly add much to a horse's appearance and can always be employed to advantage, provided they are not overdone. This is an art that cannot be learned from books. Experience is the only way to learn how to put on the elaborate rolls and braids in mane and tail, but it is not difficult to put on a few ribbons or paper flowers. It is sometimes a help to look up some illustrations in the magazines and thus get a general idea of how it is done, so as to show off a horse to best advantage. A mistake a novice often makes is to overdo the decorations. It is better to have too little rather than too much.

A few words of advice to the groom who has charge of the horse on show day. Let him be a master of himself

as well as of his horse when parading the horse. Remember that the work of a whole year is now going to be decided by the judges, and much depends upon how the horse is handled. Be quiet and unostentatious. Behave so as to inspire confidence in your horse. Do not shout or speak roughly to the horse. Speak quietly and calmly to the horse so as not to excite him. The whip may be seen in the show ring, but remember it is never used. Keep on good terms with your horse.

Lastly, remember that the man who wins will likely as not be he who has expended most work and pains on his horse, and wins by a few touches you could have equalled yourself had you the same detereminatoin to win.

B. C. TILLET.

CARING FOR THE HARNESS

The life of leather can greatly be prolonged by keeping it free from mud and well oiled. Mud is more destructive to leather than a moderate amount of wear, an water is even more destructive. Accordingly, one of the main things to be observed in the proper care of harness, is to keep the leather free from mud and water by frequent cleaning and oiling. Leather which has the proper amount of oil is pliable, and pliable leather is wear resisting.

Before attempting to oil harness unbuckle every strap and wash it clean with warm, soft water in which there is a little castile soap, using a sponge or cloth. When the leather is nearly dry apply the oil.

Vegetable oils being hardening in their effect (except castor oil) should not be applied. Neats-foot oil is considered one of the best dressings for harness. If the leather has become too dry, or has not been washed, it is necessary that it should be dampened before the oil is applied, so that it penetrates the leather thoroughly. One quart of neats-foot oil, four ounces of beef tallow and three tablespoonfuls of lamp-black makes a good dressing ofr leather of all kinds.

There are several ways in which the oil may be applied. It may be rubbed in with a woolen rag saturated with the oil, rubbing every part of the leather save the patent parts. Another way is to pour a quantity of the oil in a shallow vessel and pull the leather parts back and forth in the oil until saturated. Pass the leather back and forth slowly and rub the oil in with a sponge or woolen cloth. In either case be sure that a little more oil is applied to the buckle holes; the belly-bands, breechings, lines and straps that buckle in the bit all need an extra alllowance. On old harness that is very dry, dress with castor oil before washing; this will prevent penetration of the water, which resists oil.

HAULING A TON WEIGHT

An experiment has recently been concluded in California to determine just how much a horse pulls when he draws a ton. A good draught team was used for this purpose. The horses weighed 1600 pounds each. They were hitched to an ordinary farm wagon, and pulled a load of 6,000 pounds over different kinds of roads. The wagon was a standard farm wagon with steel axles of equal length, wheels 38 and 46 inches in diameter, and fourlinch tires.

A recording dynamometer was used to registrer the tractive force of the team. This instrument makes a record of the resistance on a strip of paper under a recording pencil, and after the test, the total pull of the team can be read off in pounds. The record of the test is as follows:

On a concrete road, unsurfaced, in excellent condition, the total pull on the load was 83 pounds, or 27.6 pounds per ton.

On a concrete road with ⅜ inch suracfe of asphaltic oil and screenings, road in excellent condition, the totad pull was 147.6 pounds or 49.2 pounds per ton.

Conserve time, money and your horse's strtngth by using
RED TIP CALKS
They will enable your horse to travel on slippery, icy roads and streets in absolute safety. They can be adjusted in a few minutes and make you ready for the road any time—day or night—eliminating danger and delay.
Neverslip Calks and Shoes always have Red Tips
Get them from your horsehsoer now
Booklet J will be sent free on request.
THE NEVERSLIP WORKS, 559 PIUS IX AVE., MONTREAL
U. S. Factory, New Brunswick

On the ordinary macadam road in excellent condition, the total pull was 193 pounds or 64.3 pounds per ton.

For a gravelled road, compact, and in good condition, the total pull was 2225 pounds or 75 pounds per ton.

An earth road, firm, with 1½ inches of fine, loose dust, the total pull was 276 pounds or 92 pounds per ton.

An earth road, with mud 4 to 6 inches deep, but soil firm underneath the total pull was 654 pounds or 218 pounds per ton.

On gravelled road before the gravel had been compacted, but when it was in ordinary loose condition after it had been placed upon the road, the total pull was 789 pounds or 263 pounds per ton.

CURING THOROUGHPIN IN HORSE'S LEG

Is there any cure for thoroughpin ? I have a horse that has got it; he never seems lame and it seems to come on through apparent cause?

H. A. C.

Thoroughpin is caused by severe strain on the joint principally through hard work. It seldom does any harm and is only objectionable as an eye sore. Lameness from it is very rare. It cannot be permanently cured, for, when made to absorb by treatment and rest, it will return with work. One way recommended to treat it is to apply a cooling lotion made as follows: 1 ounce muriate of ammonia, 1 ounce saltpetre, 1 quart water mixed together. Bathe the part with hot water, rub dry, and apply the lotion three times a day and give complete rest. Some advocate blistering but this results in thickening of the skin and leaving a permanent ruffle in the hair which only increases the apparent size of the puff when it returns.

COLT HAS SCROTAL HERNIA

Subscriber—"Sucking colt appears to be ruptured. Has been this way since birth, but did not pay any attention to same, as I thought that it was just the testicles. On examination I find both testicles, one of normal size, and the other one the size of one's fist, coming to normal at the back, which is of a soft texture. Will this be a rupture or an enlarged testicle; and what will be the safest treatment, as this is a valuable colt? Said colt it twom onths old, and is in excellent condition."

Answer—This colt has scrotal hernia or rupture at the bag containing the testicles. This form of rupture often disappears with the growth and development of the colt. The best plan in a case of this kind is to allow nature to take its course for a few months in the hope that as the colt grows and develops the rupture will disappear. If, at the end of three months' time, the rupture is getting larger, it would then be advisable to have it operated on by a veterinary surgeon. The operation for these cases is known as the "covered operation" of castration, and is very successful. Would advise you to follow the above course.

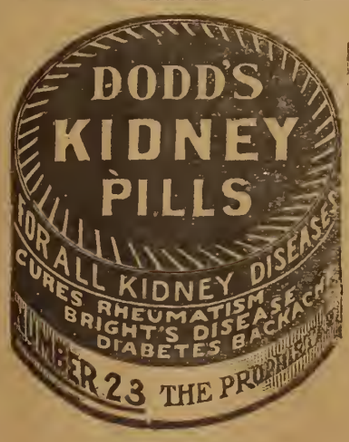
CANADA'S POSITION

Covering the years 1911-1916 Canadian total net exports of hog products were only 6.08 per cent. of the total British imports of such products.

The receipts or hogs at Canadian stockyards in September were only 64.53 per cent. of those in September 1916.

MONTREAL LIVE STOCK

MONTREAL, Dec. 3.—The week's receipts at the West End Cattle Market, 1,300 cattle, 1,100 sheep and lambs, 2400 hogs and 300 calves. This morning offerings on the market were light, and amounted to 700 sheep and lambs, 500 hogs, 200 calves. There was a good demand shown all around for th various lines and some brisk trading ensued. Prices were a little better in cattle lines on the increased buying and sold as high as $17.50 for choice Ontario stock. There was a weaker tone in hogs and prices scored a decline. Choice selects were $17.25 to $17.50. Canners' cattle were unchanged at $5 to $6. Quotations: Choice steers $10 to $10.59; goood steers, $9 to $9.50; medium, $8 to $8.75; choice butchers' bulls, $7.50 to $8; good bulls, $7; medium, $6.25 to $7; choice butchers' $8.50 to $9; good cows, $7.25 to $8; medium, $6.50 to $7; canners' cattle $5 to $6; sheep 12; lambs choice, $17.50; Quebec $15.50; choice select hogs. $18; good selects, $17.50; sows, $16 to $16.50.



HAD WORST CASE OF CONSTIPATION

DOCTOR EVER KNEW.

Although generally described as a disease, constipation can never exist unless some of the organs are deranged, which is generally found to be the liver. It consists of an inability to regularly evacuate the bowels, and as a regular action of the bowels is absolutely essential to general health, the least irregularity should never be neglected.

Milburn's Laxa-Liver Pills have no equal for relieving and curing constipation and all its allied troubles.

Mrs. F. Martin, Prince Albert, Sask., writes:—"I had one of the worst cases of constipation my doctor said he had ever known, and Milburn's Laxa-Liver Pills cured me of it. My father-in-law had used them, in fact he was the one who gave them to me. A number of people around here use them, and they all say that they are the best pills they ever used."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

POULTRY.

EARLY PULLETS VS. OLD HENS FOR EGGS

(Experimental Farms Note)

For porfitable early winter egg production the early hatched pullet is three times better than the late pullet, four times better than the yearling hen and thirty times better than the "aged" hen.

Early pullets are best for winter eggs. This has been demonstrated many times. The Poultry Division, Experimental Farm, has collected figures for several years and when the three months (November, December and January) only are taken into consideration the relative profitableness of the four ages is as noted above. If the six winter months were considered the contrast would not be so striking for the hens and the late pullets were just beginning to lay when the experiment closed. However, if eggs alone are to be considered we cannot afford to feed birds until towars spring before they produce. Even if desired for breeding it is a question if, with the high price of feed, we had not better rely upon the well matured pullet for hatching eggs next spring rather than feed hens that will not produce or only at a loss. Certainly there is no excuse whatever for keeping in our poultry houses late pullets wrose eggs cost more than they are worth and birds that are absolutely useless as breeders.

This summary is of results that extend over four years and are taken from several of the farms of the system so that figures will indicate fairly well what hay be expected for these three months.

These figures show that early pullets (hatched before May 1st.) produced eggs at a cost for feed of 18.3 cents. The late pullets (hatched after May 15th) at a cost of 56 cents. The year old hens at a cost of 78.2 cents, and for every dozen eggs laid by the hens in the aged class the cost of feed was $5.73.

Again these facts should be emphasized (1) that for profitable egg production birds should lay before February. (2) Early well matured pullets are the only birds that may be expected to do this. (3) Late pullets as a rule will not pay to keep. (4) For eggs, hens are not profitable. (5) If we have a good flock of eraly pullets, for the time being depend upon them for breeding. (6) It is a national loss to keep birds that eat a dollar's worthh of feed to produce fity cents worth of eggs.

MITES ON POULTRY REDUCE PROFITS

Chicken mites, the night pest of poultry may not always leave the fowls before daylight as commonly supposed, but may remain in the feathers in such numbers as to make poultry possible carriers of this pest to uninfested places. This fact was brought out recently by an entomologist of the U. S. Department of Agriculture in the course of a study of hte life history and habits of the chicken mite, undertaken to discover principles on which combative measures might bc based.

To prevent the introduction of this serious pest in mite-free flocks by means of new stock, the specialist suggests these precautions: New stock not known to be free of mites should bc isolated the first few nights and allowed to roost on new roosts wrapped with pieces of folded paper. The object of using the paper is to furnish a convenient place for the mites to hidc. The paper should be examined and if mites are found, the fowls should be kept on these roosts five or six days or until no more mitcs come off the fowls. Rcmoving and destroying the papers an dtreating the roosts thoroughly with kerocene or crude oil will prevent an infestation.

Methods of combating this pest include the spraying of the roosts and living quarters with crude petroleum or coal-tar products. One of the most effective sprays is a so-called wood preserver, consisting of anthracene oil with zinc chloride added. The cost of this spray is about $1 a gallon but twice the quantity may be abtained by reducing with cqual parts of kerosene.

POULTRY IN PLACE OF BEEF

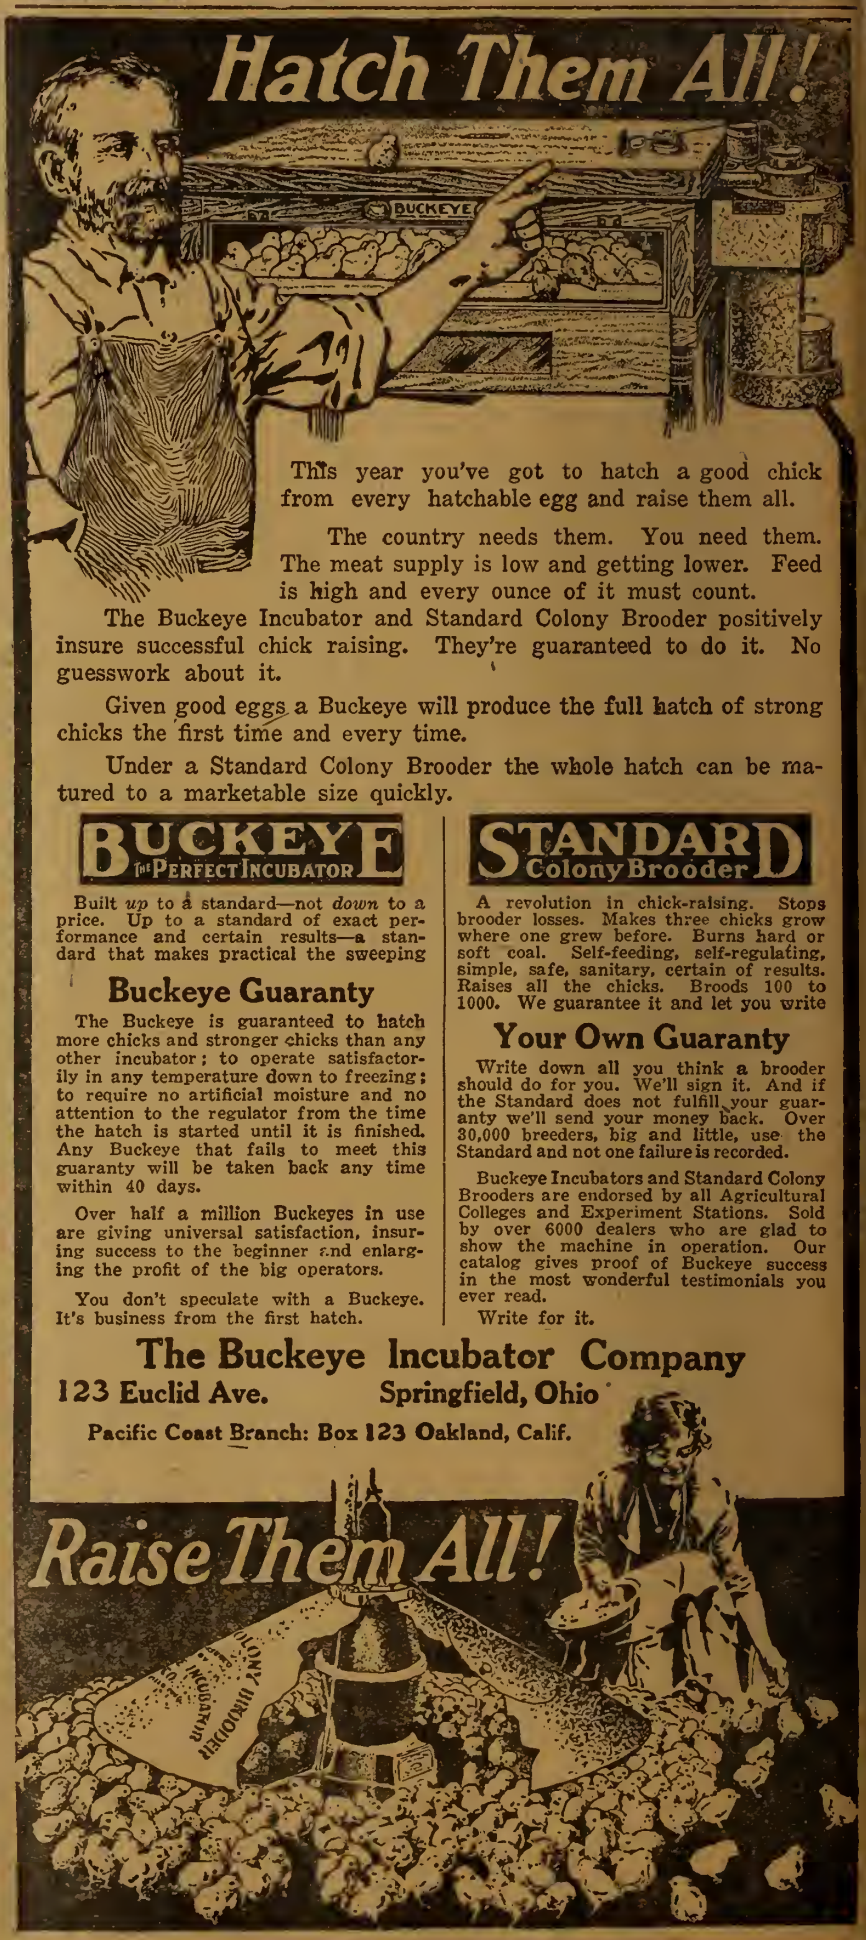
In the ntcrest of food conservtaion, and that we may supply our own soldiers and those of our allies, with beef in plenty to keep them in good physical condition and fit to fight our grat battels for us, thc United States Government is urging us to use more poulthy and eggs as our hearty food on our own tables, and to gretaly lessen the amount of beef used. This is a wise suggestion and one that all farmers especially, should follow. Pork is not as easily preserved annd transported as beef and the farmer who cares for it may raise and use it, bue even then he should raise and use more poultry and eggs, for a meat diet of pork alone is not conductive to health and happiness. Too much pork is bad anyway.

Of course we can have the beef—for a while—if we insist, but unless we conserve the food and conserve it diligently, the time will come only too soon when there will be no more beef available, either for us at home or for our soldiers abroad. Beef cattle are scarce now, and growing more so every day. The herds must be replenished, and it will take years to do it, therefore they should not be further depleted. Poultry may be raised quickyly, supplying excellent meat at a cost no greater than that of beef, and every farmer who makes this substitution of meat for his own table is performing a patriotic duty without in any way inconveniencing either himself or his family.

The exorbitantly high cost of grain is given as a reason for curtailing in the poultry business, but it is no reasonable excuse. If we look at the matter fairly, we must admit that increased cost in feed is, even if too great, not greater than the selling value of poultry and eggs, and not much, if any greater than the increased cost of other things used on the table. As a matter of fact, poultry and eggs may now be produced proportionately cheaper than either beef or cattle for the same percentage of food value—at least, the food experts affirm that this is so, and it would be exceedingly difficult to prove that they are wrong.

There is nothing in the way of

PEERLESS
PERFECTION
The Fence
For Real Protection
gives life time service. Is made of the best Open Hearth steel fence wire, all impurities burned out, all the strength and toughness left in. Makes the fence elastic and springy. Will not snap or break under sudden shocks or quick atmospheric changes. Galvanized to prevent rust and the coating will not flake, peel or chip off. Can be erected over the most hilly and uneven ground, without buckling, snapping or kinking. Every joint is locked together with the well-known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences.
Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing. Agents nearly everywhere. Agents wanted in uassigned territory.
THE BANWELL-HOXIE WIRE FENCE CO., Ltd.
Winnipeg, Manitoba Hamilton, Ontario



Hatch Them All!
BUCKEYE
This year you've got to hatch a good chick from every hatchable egg and raise them all.
The country needs them. You need them. The meat supply is low and getting lower. Feed is high and every ounce of it must count.
The Buckeye Incubator and Standard Colony Brooder positively insure successful chick raising. They're guaranteed to do it. No guesswork about it.
Given good eggs a Buckeye will produce the full hatch of strong chicks the first time and every time.
Under a Standard Colony Brooder the whole hatch can be matured to a marketable size quickly.
BUCKEYE
The Perfect Incubator
Built up to a standard—not down to a price. Up to a standard of exact performance and certain results—a standard that makes practical the sweeping
Buckeye Guaranty
The Buckeye is guaranteed to hatch more chicks and stronger chicks than any other incubator; to operate satisfactorily in any temperature down to freezing; to require no artificial moisture and no attention to the regulator from the time the hatch is started until it is finished. Any Buckeye that fails to meet this guaranty will be taken back any time within 40 days.
Over half a million Buckeyes in use are giving universal satisfaction, insuring success to the beginner and enlarging the profit of the big operators.
You don't speculate with a Buckeye. It's business from the first hatch.
STANDARD
Colony Brooder
A revolution in chick-raising. Stops brooder losses. Makes three chicks grow where one grew before. Burns hard or soft coal. Self-feeding, self-regulating, simple, safe, sanitary, certain of results. Raises all the chicks. Broods 100 to 1000. We guarantee it and let you write
Your Own Guaranty
Write down all you think a brooder should do for you. We'll sign it. And if the Standard does not fulfill your guaranty we'll send your money back. Over 30,000 breeders, big and little, use the Standard and not one failure is recorded.
Buckeye Incubators and Standard Colony Brooders are endorsed by all Agricultural Colleges and Experiment Stations. Sold by over 6000 dealers who are glad to show the machine in operation. Our catalog gives proof of Buckeye success in the most wonderful testimonials you ever read.
Write for it.

meat that can be produced and matured as quickly as poultry, and there is no food of equal value that can be put to as many uses and made palatable and nourishing in as many ways as eggs. Now that we must curtail in the use of wheat bread, sugar and the other articles of food which are becoming scarce, we must be more careful and consistent in the use of those articles of food which we are able to produce ourselves, so that we may become less dependent upon others and more nearly self supporting in actual production as well as earning capacity.

nAother thing that should be remembered is that with a shortage of beef, there is going to be a greater demand for both pork and poultry facts of which the farmer may well take advantage of in a business way. In the next year or two, and perhaps for several years after that, there will be a largely increaser demand for both poultry and eggs because of the war, rather than otherwise, and the same will be true of eggs as well. This will, of course mean good prices right along, and a porfitable business for those who take advantage of conditions and seek the best markets. It is likely that these conditions, modified of course by varying circumstances, will continue as long as the war lasts, and there is no likelihood that more poultry and eggs can be produced, no matter how high prices of grain may soar, than can be used to good advantage or sold at a good profit.

H. L. Goodwin.

TELLING THE LAYING HEN

To make a success it is imperative that we know our hens. We must test their abilities. We cannot afford to keep drones.

Therefore, we must adopt some method by which we can determine the good from the bad. Noticing a hen repeatedly upon the nest is not a guarantee that she is about to lay. In using trapnests, I have almost daily captured hens on the nest, but no egg and their annual records were ver low.

Every time a hen cackles when coming out of the laying room, is no criterion that she has laid. I believe it was Collingwood who once said: "A cackling hen is either a layer or a liar" and in using trapnests, I have found quite a number of these cacklers to be "liars."

So prior to the adoption of trapnests, the selection of layers has been more or less guess work. It was said by some writers that "spare and leggy birds are the best layers." This opinion no doubt was based upon the act that the Mediterranean class is built after that fashion.

This view was corroborated by the late Francis A. Mortimer, when he said that he found that hens with short legs, chunky bodies, short necks and small heads, are as a rule, indifferent layers. This would seem so from the standpoint that such hens are more of the meat order, but trapnests have told us that during the last few years our chunkiest Wyandottes were in the front row of layers.

Felch said the pullets that commence laying earliest in life are the ones to lay the largest number of eggs through life. There is some logic in that, but we cannot always tell our earliest layers if we have no system of trapping them.

Some years ago there was quite a discussion of the so-called "egg type." Nearly all these opinions were based on the style of the Leghorn, but some writers differed. For example, one writer said that good layers have a "long, slim body, are broad across the shoulders, are triangular, deep in front, not compact, and havt legs of good length." Another differed by saying: "Carefully avoid the leggy high-built, reared-up hen of the game cock style. It is the short-legged, heavy-set, motherly-lookisg hen that shells out the eggs." Many references could be given on this type quesiton, but the opposites, quoted above, are fair samples of representatives made in early days.

There is but one sure way of finding out which are the workers—we must catch the hens in the act. Each hen is to be known by the number on the band or ring that is placed on her leg. Catching the hen in the trapnest, her number is ascertained, and this marked on the egg. Each evening after the eggs are gathered, these numbers are properly creddited on a record blank provided for this purpose. At the end of the year we know for a certainty how many eggs the hen has laid. Not only that, but we also know the size of her eggs—whether normal or not—the color, whether white, brown or tinted.

I do not, however, employ trapnests soley for the purpose of finding out which are my best year-round layers. I want to know which are the profitable workers during the late fall, winter and early spring—times when eggs bring the best prices. It is not a quesoion (with me) how many eggs a hen lays in a year, but how much money her product brings. If it is possible to concentrate the bulk of her crop in six months of the uear, when prices are high, and induce her to "take it easy" during the warm months, devoting the most of that time to broodiness and molting, I will have a stronger stock, and consequently more profit.

In couclusion let me state that there is but one guaranteed way of determining our profitable layers, and that is by the aid of trapnests, and no poultryman can afford to do without them. It will mean a profit in the crop, and a saving of feed, room and labor. M.K.B.

Brain Power!
"Burning the Midnight Oil," is a dangerous occupation unless the body and brain are suitably tuned up for the occasion. Over-work frequently results in break-down, breakdown means loss to business, lost time—disorganization. Those who put extra burdens upon the brain through the necessity of continuous concentration of the mind need a food that has a large percentage of Carbo-Hydrates, Proteins and Fats. COCOA—when mixed with milk, contains these essential ingredients in abundance. It is the ideal food drink for such occasions and for the best and surest results use only.
COWAN'S
COCOA—
"Perfection Brand" Purest and Best
For the safest and best results Remember—only this Brand.

CANNING CHICKEN

There is no question but that the best place for cull chickens is in a jar, ready for table use. Canning changes a non-productive fowl from a libility into an asset. Such a chicken does not eat high priced feed, does not require daily attention and takes up much less space on the pantry shelf than it does in the poultry house. At a few moments notice the canned chicken can be prepared for the table in any one of many appetizing ways: fried chicken, smothered chicken, stewed chicken with dumplings, creamed chicken, chicken a la King, chicken and rice croquettes, loaf, salad or practically any way fresh chickwhole.

Method 1 given below is for small, frying sized chickens. Methods 2 and 3 may be used for chickens of any size.

Method -—Dress the chicken, separating it into sections or leaving it whole as preferred. Season and fry as for serving. When the meat is three-fourths done remove from the fire and pack the pieces into a clean, hot glass jar. If the chicken is whole break the neck and legs, roll the chicken up into a small roll, tie with string or fasten with toothpicks. A quart jar should hold two or more small chickens. Pour over the chicken the hot liquid from the frying pan, if necessary adding hot water to fill the jar completely. Adjust the rubbers and tops, leaving the lattter slightly loose. Place in a waterbath canner and sterilize from 90 to 120 minutes, depending upon te size of the of the chicken. Remove and tighten the covers immediatetly.

Method 2—Dress the chicken and leave whole or cut into pieces as preferred. Cover with boiling water and simmer until the meat can be separated from the bones. Return the bones to the liquid and boil it down one-half. Pack the meat closely in hot glass jars, add one level tablespoonful salt to each quart and fill the jar with the hot liquid. Adjust the rubber and top, leaving the latter slightly loose. Sterilize 3 to 3½ hours in a water bath canner. Remove and tighten the tops immediately. The liquid remaining may be placed in a jar, steriiized 90 minutes and kept for soup or gravy. Two pounds of dressed fowl should make one pint of solid meat and a pint of thick stock.

Method 3—Cut the dressed, raw chicken into convenient sections and pack into jars. Add one tablespoonful salt to a quart, fiill the jar with boiling water, adjust the rubbers and tops as above and sterilize in a waterbath canner 3½ to 4 hours.

DAMPNESS IN POULTRY HOUSES FOR EGGS

Dampness in any form, whether emanating from outside sources or from within, seriously impairs the vitality of hens during the fall and winter, and directly affects production. Fowls are anatomically different form other farm animals, in that they exhale from the lungs, in the form of vapour a very large proportion of the water that the ydrik. This causes the atmosphere in the interior of a tightly closed poultry house to become very humid, and in cold weather the walls and ceilings to become frosted.

Two simple methods of removing dampness are in common use: (a) the straw loft, which consists in placing a thick layer of straw on poles or rough lumber located at intervals on the collar beams. This mtehod is, of course, better adapted to square or hip-roofed houses than to shed-roof houses. (b) The use of the cotton or open-front houses. Many people have the erroneous idea that the cotton-front houses are colder than those having many windows. It has been proven without doubt that glass is a more effective conductor of heat than cloth. Thin cotton or burlap allows the moisture in the house to pass out and brings about an equilization of outside and inside humidity.

LAYING HENS NEED GRIT

Ground feeds are necessary for most efficient digestion in poultry. Hopper feeding saves labor and furnishes the necessary supplementary feed at all times. There is no danger of poultry over eating on ground feeds fed dry in a hopper. The University of Missouri College of Agriculture is recommending the hopper as a lobor saver in the poultry yard.

Limestone grit or oyster shell is also necessary for laying hens. A laying hen requires large quantities of shell-making material. Nearly all of this must come from the grit and shell she eats. It is poor economy not to keep a liberal supply accesible. One extra egg a year will pay the bill. It returns the money invested a hundred fold.

Chickens raised on range can be produced much more economically than those kept closely confined around the farm buildings. Not only is less feed required, but the danger from disease is reduced. The edge of the corn field makes an ideal poultry range. Chickens grow best on plowe ground and the corn furnishes shade, which is essential during the summer. Under such conditions a pound of chicken can be produced from three to four pounds of grain.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

SOLDIERS OF FREEDOM

They veiled their souls with laughter
And many a mocking pose,
These lads who follow after
Wherever freedom goes;
These lads we used to censure
For levity and ease,
On Freedom's high adventure
Go shining overseas.

Our springing hearts adore them,
These boys at school and play,
Fair-fortuned years before them,
Alas! but yesterady;
Divine with sudden splendor
Oh, how our eyes were blind!
In careless self-surrender
They battle for mankind.

Soldiers of Freedom! Gleaming
And golden they depart,
Transfigured by the dreaming
Of boyhood's hidden heart.
Her lovers they confess them
And, rushing on her foes,
Toss her with youth—God bless them!
As lightly as a rose.

KATHERINE LEE BATES.

AT EVENTIDE

This very day, while I with sweet content
Fulfill the common daily round, on homely duties bent,
From many a happy home, with careless unconcern
And gay good-by, have fared forth feet that never will return.
And what hath she who waits with all the world beside,
If nevermore her loved one comes home at eventide?

And what indeed am I, that God should give to me
So glad and blest a life, a home from grief so free?
That this sweet common day, for me without a tear,
Should bring for some the crushing loss of all life holds most dear?
That kept secure from whatsoever danger may betide,
My own come safely back to me today at eventide?

Help me, O Lord, I pray, my gratitude to show
In tender, loving ministry where falls the sudden blow;
In daily walking softly, lest the terror nigh
Descend in darkness swift and deep, o'erspreading all my sky,
And there should come to sit my own hearthstone beside,
The grief of one who waits alone, alone at eventide.

O Father loving all, I gladly trust to Thee
The days to come, that good or ill, I still may see
Thy tenderness in each; and whether stress or peace
They bring, I still can praise with praise that cannot cease,
That for so man ears love hath not been denied,
And I have welcomed home so long, m own at eventide.

LILLIAN MANKER ALLEN.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

LATCHSTRING HOSPITALITY

The Worth of Simple Kindness

The other day I chanced to be in a company of women when the subject under discusion turned upon that ever fruitful topic—matrimony. Some of the women present were married, some were not, but we all contributed freely to the general discussion.

In this discussion, the subject was whether or not the marriage of the average woman tended to broaden or to narrow her sympathies.

"All true women are supposed to have the spirit of universal motherhood," some one reminded us.

"But I don't believe we have," one married woman candidly admitted. "Before I married I loved all children. I could scarcely get by a baby on the street without stopping to look at him. But now I don't feel the slightest interest in any child except my own. I think, as a rule it is the unmarried women who have the spirit of universal motherhood."

One of our number, a thoughtful, quiet little lady whose unobtrusive acts of kindness are as the sands of the sea, advnaced the theory that, "quite apart from the motherhood point of view, there is something about marriage, the very fact of two people living together in such close intimacy and having to adjust themselves somewhat to each other, which gives to character a discipline that nothing else can, and makes for unselfishness."

This philosophy was very quietly expressed, but it touched a match to an unsuspected store of gunpowder. Most of the married women present accepted it with complacent acquiesence, but in the opposing camp were those who demurred and those who denounced.

"Why is it any better discipline to marry and adapt yourself to the demands of husband and children who love you, than to forego marriage, adapt yourself to the world from which you wring a livelihood, and battle besides with loneliness and a sense of failure?"

This question came from a hard-working professional woman who is supporting an invalid mother and helping a younger sister through college. It was worthy of respectful attention, and it inspired another woman present to give us the following illuminating bit of personal history:

"I was raised in the country," she said. "And when I graduated from the little district school, I had to drive three miles to the union high-school. My mother was an invalid, but in spite of the fact that most of her time was spent either in bed or on the livin-room couch, she had the largest and most varied asortment of friend of anyone in te country. During my grammar-school days, she had often invited my teacher—a frail little thing from a near-by city—to come home for week-ends. When I went to the high-school, where I had a different instructro for every subject, she had extended her hospitality to them all before the first period was over.

"I remember that my English teacher re during my fresmn year was a brilliant sad-eyed woman who rather antagonized our class by her ready sarcasm, although in every respect, I like her. I once complained to my mother of this one irritating trait. 'Don't be harsh in your judgment,' she urged, in her quiet nuderstanding way. 'She has had a sad life; enough trouble to have embittered her and broken her heart.' "

"At that time I did not think it strange that mother should have known all about Miss R—'s troubles. I accepted that as a matter of course People always told mother things. It is only in later years when I look back at that austere, reserved Boston woman that I marvel at my mother's genius for winning confidence.

"When I came away from home to take my first school, I entered into boarding-house life with all the thoughtless courage of the untried. To the commiseration and warnings which I heard all apout me as to 'the dreariness of it all. I turned an unheeding ear. Why must people be so gloomy about going out into the world? I wondered rather contemptuously. Of course it might be lonely at the very first, but after you got to know the mothers of your pupils—wh, I was going to be a live-wire teacher, and I'd have a host of friends in no time.

"In order to be a live wire, it is necessary to throw yourself heart and souul into your work, and for the first few months I was so absorbed in my profession that I had no time for social intercourse. Then came the gray days, when, work well in hand, I began to look for friends and recreation.

"I suppose my experience is the experience of most young women who have had to substitute a professional life for a domestic one. But to me the absolute exclusion from all home hospitality was praticularly hard because it was so unexpected. I had assumed that because my mother had thrown open her heart and home to so many women adrift in the world, that other mothers wouuld do the same for me. I had accepted as a natural law the universal motherhood theory.

"In six days I was invited twice into the homes of pupils, and the object of both my hostesses was to ask my as-my assistance in solving a problem concerning a child. It was after the latter of these calls that the real genius of my own mother disclosed itself to me in retrospect. She had always made our guests feel that it was for their own sakes she wished their friendship. She wanted to know them and give them something that had been temporarily taken out of their lives. Therein lay the radiant charm of her hospitality.

"During the six years of my teaching experience I have had several hundred children entrusted to my care and I have been just those two times into their homes. I have helped plan celebrations for mother's birthday. I have been chief advisor as to appropriate and inexpensive Christmas gifts. I have suggested programs for parties and evolved original games. And having done all this, I have suffered such aching lonliness that I have walked the streets in the evenings and looked into the windows. There was one house that I particularly remember, near the place where I boarded. It had a long, beautiful living room with a big, open fireplace and a pink-shaded lamp, and the people who lived in the house never pulled the shades all the way down.

"I am married now and have a home of my own, but I think it will take years of happy domestic life to soften the bitterness that I feel toward the selfish married people, who, snug and complacent in the love of husband and children, never spare a thought for the homeless and lonely. Sometimes I used to wish that I coulud get back at them in some way, to make them feel some of the loneliness that I have felt, but I have learned that the only revenge in life worth while is to save someone lese from the kind of pain that you yourself have suffered.'

It seemed to me that there was something very significant and vital about that little story. Many of us feel that as the heads of cheerful, happy homes, we are doing all that society could demand of us. A woman's first duty is, of course, to her husband and children. But after all, the little outside kindnesses and courtesies to those who are strangers and alone have some place in life. The world would be a sorry, dismal place if all of us simply did our duty to the home people, and nothing else.

This article is an appeal to the home woman not to leave up the shades of her living room, but to open a little wider the door. Hospitality is of two kinds; the latchkey kind and the latchstring kind. The former admits to our homes only those people with whom we have a common interest, the elect, to whom we have entrusted a key, and who are free to come in so long as they retain possession of it. The other kind admits anyone who has been sufficiently attracted to us to come up on the porch and pull the string.

The time is long past when gods masqueraded as men and there was an exciting possibility of sometimes entertaining an angel unawares. It's more than likely now htat our guests will always be 'just folks." But after all I like this condition best. It would be rather terrifying to discover that you had been entertaining an angel and angels could never value our efforts as much as some lonely woman who has learned in the hard school of life, the true worth of even the simplest hospitality which a real home offers her.

MEMORIES OF HOME

Dear to us still are the friendships formed during the period of our school life, and hard was the breaking of those ties, yet we cherish no such memories of our school mates as we do of home and mother.

If we have not already severed the ties of home, the time will come all

to soon when the silken cord will be broken. This thought should make us enjoy all we can of life's sweet dream of childhood. If we are making preparations for a new home which the poetry of younth has painted with brilliant colors, we should not forget that the walls of our new home must be forever decorated with the picture of our old home. You may place the wide expanse of ocean between the two homes, but memory will paint the home of your childhood. We may lavish upon it all the rich accumulation of youth and manhood, but beside the costly paintings that adorn the parlor there hangs the picture of the old home. Do what you will it hangs there forever. It is a magic picture, you require no light to see it, you can see it better in the hushed stillness of the nigth than in the light of day. If the associations of that home have been unpleasant. If there is that picture, a mother who in the little room you used to occupy, sits weeping over your waywardness, with dark autographs of sorrow written across her brow; if there is a sister with a down cast look; a father sitting by the fireside with his head resting on his hands, prematurely old because you broke his heart; how will that picture haunt your guilty soul in the night, how will the sadness embitter every cup of joy, and turn to wormwood every pleasure? You cannot ask that father's forgiveness, it is too late. You cannot go to mother whose loving hand might perhaps put a veil over that hateful picture or hang in its place a more beautiful one. It is all too late, mother is gone. You can go to the old, the shed where you played with sister may be torn down and changed, everything is changed. But this will revive no pleasant memories, nothing but the sad day when you quarreled about picking apples, struck your little brother who is now sleeping in the garden with your mother. You can go there and call his name but he will not hear you, you may strew with flowers the graves of father and mother and brothers, you may erect costly stones, these will not atone. Do not wait for the sad day but while moher and father are alive, and your little brother is with you, make home happy and cheerful to all around. Keep mother's brow smooth, father's hair unsilvered. If you cannot make your father and mother truly happy and love them you canot make any heart happy. We should always try to make our home happy and greet every one with a smile. What we need is more sunshine in the home, more home influence with our boys and girls so that when they are taken aw aythere will be nothing but loving pleasant memories of Home.

Oh memory be sweet to me

Take, take all else at will
To thou but leave me safe and sound
Without a token my heart to wound
The little house on the hill.

Take all of best from east to west
To thou but leave me still
The chamber where in the starry light
I used to be awake at night
And list to the whip-poor-will.

But memory, be sweet to me
And build the wall at will
Of the chamber where I used to mark
So softly rippling over the dark
The song of the whip-poor-will.

Oh memory! be sweet to me
All other fountains chill;
But leave that song so weird and wild
Dear as its life to the heart of the child
In the little house on the hill.

GIRL'S RUSSIAN BLOUSE DRESS.

By Anabel Worthington.

One look at this design makes it clear to us why the fancy of fickle fashion is securely anchored in the Russian blouse. Truly it is a most satisfying style for the growing girl.

In the model illustrated the blouse slips on over the head, is loosely belted at a bit below normal waist line, with pockets in contrasting note clinging to the belt for novelty and to delight the wearer. The sleeve may be in three-quarter length and finished with a very lovely cuff, as pictured, or a long sleeve with its fulness gathered into a wristband cuff may be your choice.

The separate two gore skirt is of different material, but all one may be employed to advantage. Many mothers like a woollen weave for the skirt and linen for the blouse. Others use striped and plain material, as in the illustration, or reverse and make the blouse of striped, trimmed with plain material, and the skirt of plain ground goods. The detail touches are effective, but the lines of this model are so very simple that a girl who has been taught sewing in the schoolroom can copy the design without effort.

The pattern No. 8,153 cuts in sizes 8 to 14 years. To make in size 10 requires 1½ yards of 36 inch goods for the skirt and trimming of blouse, and 2¼ yards of 36 inch material for the rest of the dress.

To obtain the pattern send to the office of this publication.

LOOKING BACKWARD

One more year has drawn to a close but before we write "finis," let us spend a few minutes in retrospection.

We have had a busy twelve months, filled with many cares, troubles and anxieties. Our cares and anxieties, in so far as they were personally connected with the national conflict, have indeed been very real, but the most of our troubles we must admit have been imaginary, and many of the burdens have truly been of our own making.

To count our blessings we have only to remember Belgium. Though far-distant lands are hallowed with the bodies of our heroes, "God's acres" here are filled with loved ones gleaned from the ordinary walks of life.

We do not need to seek the battlefields for death, for with its accompanying sorrows it steals into our households in time of peace. For the aged death has no terror. For them it is as Bryant tells us, a mere drawing of the drapery of the couch about them and a lying down to pleasant dreams.

It is not death that should trouble us, but life. We have too much sorrow for the dead and not enough for the living. We are too prone to aid the sick-unto-death when they are past helping, and salve our conscience with wreaths and crosses.

In the heydey of life our needs are more urgent. As we glance beckward through the year, can we truthfully say that, with a spirit of Chistian grace, we have fileed the lives of those about us with cheer and happiness

Have we lived in harmony with our surrondings?

Have we scattered kind words, loving thoughts, and tender sympathy to all humanity along the year's journey?

Have we lived in harmony with our fellow-men, or have we sown discord with thoughtless, selfish words and acts, and put "sweet bells out of tune?"

Is the underlying motive in our charity and patriotic work a pure one or do we seek the praise of men for good deeds?

Are our hearts so deep in the cause that self is undermost?

In Institute affairs, have we been true and faithful to the work?

Have we given the proper support to our officials and generous, sympathetic aid to each other in alloted work

Has a spirit of contentment possessed us over our smaller portion, or have we grumbled and antagonized our associates?

Can we, as the infant year comes into being, step out anew and meeting ur fellw-creatures, eye to eye, say, in all sincerity, "Peace unto thee and thine?"

LET US TRY IT.

MEAT SUBSTITUTES

Mock Sausage.

½ c. beans, boiled and put through a sieve, 1-3 c. bread crumbs, 3 tbsp. butter, pepper, ¼ tsp. salt, ½ tsp. sage, 1 egg. Roll sausage in crumbs, egg and crumbs and fry.

Mock Hamburg Steak

1 c. chopped nuts, ½ c. milk, ½ tsp. salt, 1 c. bread crumbs, ¼ tsp. onion juice, pepper, 1 egg. Make mixture in small cakes and fry.

Vegetable Loaf

1 c. vegetable pulp, (peas or beans), 1½ c. crumbs, 1½ c. milk, 1 tsp. salt, 1 tsp. sugar, pepper, ¼ c. fat, 1 egg, onion. Mix all the ingredients together, place in baking pan and bake for 30 or 40 minutes.

Peanut Fondu

1 c. ground peanuts, 1 c. bread crumbs, 1 2-3 c. milk, 1 egg, 1 tsp. salt, cayenne. Add stiffly beaten egg white last and bake. Serve at once.

Kidney Bean Stew

1 c. beans, 1 small onion, 2 tbsp. rice, 2 c. stewed tomatoes, 2 tbsp. fat, 2 tbsp. flour, salt, pepper. Soak beans over night and cook until tender, add onion, rice and tomatoes and just before serving, melt fat add flour and seasonings and then bean mixture, cook a moment and serve.

Eat an apple a day—if you have them. They did better than that in the Garden of Eden. Some say Eve 8 and Adam 2, but it is more likely that Eve 8-- and Adam 81--2—a total of 893. Eat 1 anyway, but eat another 1-2 if you can.

Watch for rabbit work in the orchard and get the rabbit before he gets your trees. Tramp the snow well around each tree to discourage mice working under the crust.

Fashions Dept.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

BOY'S RUSSIAN SUIT.

By Anabel Worthington.

The Russian style, so long the favorite with mothers and with Fashion, continues triumphant among the models offered for the small boy. It is, of course, decidedly boyish and when made like the suit shown by this drawing is sure to create interest.

The blouse, cut with smart closing outline, has a neat round collar of the goods or of material in different weave and opposing color; full length sleeves are cuffed to match. At a lowered waistline the fulness is neatly drawn in with a patent leather belt or one of the material in the suit.

A pocket is a little thing, but when a boy of six years is concerned it looms very large, so it will be to advantage to add a pocket to the left side, using self material or contrasting goods, according to the fabric that contributes the collar and cuffs. Any little fellow will feel proud and grown up if straight trousers complete the suit.

In most cases this type of suit is developed in St. Nicholas cloth, gingham, linen or galatea, but one may choose wool mixtures, serge or like weave for a kindergarten suit. There is very little work to copying the design and no worry at all, for the pattern is in pictures for your convenience.

The suit pattern, No. 8.133. cuts in sizes, two, four and six years.

To make in the medium size requires two yards thirty-six inch material; one-quarter yard thirty-two inch contrasting goods.

To obtain the pattern send 10 cents to the office of this publication.

WHEN A COW GIVES HER GREATEST YIELD

The majority of people are under the impression that a cow gives her greatest production of milk a very few days after she drops her calf.

The good cow in the hands of an experienced feeder, however, doesn't reach her highest production until four or five weeks after she freshens. He watches her general conditions and gives her all the feed she needs to make the supply of milk she is producing. Then he adds a little to the ration and notes results. If she responds in the proportion of three to one, that is giving him three pounds of milk additional for every additional pound if meal that he gives her, he lets her have this larger feed for two or three days and then increases it a little more. He keeps telling her that as long as she makes good use of the additional feed, she can have it.

He is very careful, however, to watch her general health and appetite. He keeps her hungry for her meals and takes away her feed if she shows any disposition not to relish it. In addition to using the feed he gives her, she has nutriment stored on her carcass which she laid up during her rest period and makes good use of it for the first few weeks after freshening.

At the end of four or five weeks he gets her up to her highest production and from then on, it is just a case of holding her as nearly as possible to that high production without giving her too much ground feed. At all times he lets her understand that she must produce milk in proportion to the ground feed that he is giving her and as soon as she begins to fall off a little in the milk supply he cuts down on the amount of ground feed that he gives her.

He studies the cow as an individual because he knows that some cows do not need quite as much ground feed as others to produce given results.—Ex.

BUY YOUR PURE BRED POULTRY IN THE FALL

October is probably the best month of the whole year for starting with the pure bred poultry, or for adding to the purity of one's flock, if this process is to be accomplished by the purchase of fowls instead of chicks.

Breeders always have an abundance of breeding fowls, both males and females, for disposal in the fall, and are willing to let them go at comparatively low prices now in order to make room for the young birds they are raising and which are requiring more and more room with each passing weeek.

Therefroe, if you are contemplating the purchase of stock of any age, now is the time to go ahead and do it.

As a rule, more real progress can be made in a year's time by starting with a trio or pen of pure-bred fowls, rather than by buying two or three blooded roosters and mating these with twenty-five or thirty mongrel females. In the latter event it is true that more eggs can be set and if the plan is continued for several years all the birds will ultimately become uniform in type and color, but it will take many generations before all the mongrel blood is bred out, and the bad effects of a mixe foundation sometimes stays with a strain permanently.

If you buy a trio or a small pen of five to ten breeding fowls, the investment should not be excessive and a year or two of careful breeding ought to return you a fine, large flock of known ancestry and good points. In the meantime you could retain your mongrel stock to produce market eggs keeping your pure-breds in a flock by themselves and using all their eggs for hatching. The second season should give you enough pure-bred stock on hand to justify you in disposing of all scrubs and keep nothing but top notch specimens.—R. B. S.

THE GARDEN SOIL

The garden soil should be fertile. Vegetables are heavy feeders but they

The Pallor of Anaemia Calls for Reconstructive Treatment

ANAEMIA comes on so insidiously that you may not realize its presence until a look in your mirror discloses the pallor of the skin and of the gums, the lips and the eyelids.

You may be gaining in weight, but the flesh is soft and flabby, and you are laying on fat rather than muscle. You find yourself disinclined to exertion, and greatly fatigued by any effort. There is weakness, heart palpitation and a disturbance of the digestive system.

The failure of the organs of digestion to derive proper nutrition from the food you eat has reduced the number of red corpuscles in the blood. The blood has become thin and watery, and in spite of the food you eat you are literally starving to death.

As this process continues you must necessarily grow weaker and weaker, and the bodily organs become more and more incapable of performing their natural functions.

There can be no question that Dr. Chase's Nerve Food is the ideal treatment for anaemia or bloodlessness, because it supplies to the blood in condensed form the very elements from which new, rich blood is created. In this way it makes up for the deficiencies of the digestive system, and sets in motion the process of reconstructon.

As the blood improves in quality under this treatment the action of the heart is strengthened, circulation is better, appetite is sharpened, the digestive organs gradually resume their functions, and you gain in strength and vigor.

You will not use this food cure long before you realize the upbuilding influence on your system. With returning strength comes new hope and confidence. The discouraging days will disappear from your life, and you will feel again the joy of health.

The Food Cure

Miss Alice Howes, 21 Haddington Street, Galt, Ont., writes :—"I was very ill with anaemia, could not sleep at night, and my appetite seemed entirely gone. I suffered in this way for nearly three years, and had treatment from two doctors in Toronto, where I was living at the time, but did not get any relief. I became completely run down, and as I did not see any immediate hopes of getting better, I went back to live with my mother in Galt. I thought, perhaps, the change of air might do me good. My mother saw that I was in a bad state, because my nerves were affected, and everywhere I went I used to take dizzy and fainting spells. My hands and limbs would become numb, I would see black specks before my eyes, and cold perspiration would come out on me. My mother had been taking Dr. Chase's Nerve Food with excellent results, and she advised me to do the same. But it is hard for me to take pills, so I went to a doctor in Galt instead. However, his treatment did me no good, so I at last decided to follow my mother's advice. I began taking Dr. Chase's Nerve Food, and gradually found myself getting better. I soon was able to sleep at night without any difficulty, my appetite came back, and I began to gain back my natural color. After taking about twelve boxes of this medicine I was able to return to my work in Toronto. My friends there all noticed the improvement in my condition, and I am now stronger and healthier than I have been for a long, long time. I shall always recommend Dr. Chase's Nerve Food wherever I go, as I really think it is the best treatment obtainable for worn-out nerves and run-down system."

Dr. Chase's Nerve Food

50 cents a box, a full treatment of 6 boxes for $2.75, at all dealers, or Edmanson, Bates & Co., Limited, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

IMPORTANT CHANGES IN TRAIN SCHEDULES

General Time Changes on Canadian Govern ent Railways on January 6th.

MARITIME EXPRESS WILL BE THE DAILY THROUGH TRAIN

Important changes in the train schedules of the Canadian Government Railways will go into effect on January 6th, 1918.

The Ocean Limited now running daily between Montreal and Halifax will after that date leave Montreal daily except Saturday at 6.40 p. m. instead of at 7.00 p. m., and arrive at Halifax daily except Sunday at 11.40 p. m. The Westbound Ocean Limited will leave Halifax daily except Sunday at 7.45 a. m. and arrive in Montreal at 9.45 a. m. daily except Monday.

Teh Maritime Express will be the daily through train, leaving Montreal at 9.25 a. m. and arriving at Halifax at 4.00 p. m., and leaving Halifax westbound at 3.00 p. m. and arriving in Montreal at 7.40 p. m. It will be seen that theschedules of both trains have been lengthened slightly so as to give a little more running time during the period of difficult operating conditions.

The new time table will ont greatly affect the local train service, and but few changes are predicted in the branch lines, excepting to alter the schedules of connecting trains with the through express.

The service between Prince Edward Island and the mainland is now via Cape Tormentine, and on and after December 31st the car ferry "Prince Edward Island" will leave Port Borden, P. E. I., after the arrival of the morning express trains from Charottetown and Summerside, and arrive at Cape Tormentine to connect with a train leaving there at 10.30 a. m. and arriving at Sackville at 12.05 noon; connecting there with the Ocean Limited westbound, and with No. 18 express for Truro. Theafternoon passenger train to connect with the steamer will leave Sackville at 1.00 p. m. arriving at Cape Tormentine at 2.30 p m. affording a connection for passengers for the Island on trains No. 199, 4, and 18.

The changes of January 6th will also bring about the start of a direct passenger service between Quebec and Montreal via the new Quebec bridge. The local express train No. 45 and 46 will perform this service for the present, No. 45 leaving Quebec at 3.45 p. m. and arriving in Montreal at 10 25 p. m. daily except Sunday. No. 46 will leave Montreal at 7.15 a.m. and arrive in Quebec at 1.55 p. m. These trains will run in and out of Palais Station. The daiyl express trains between Edmundston and Levis will henceforth run in and out of Quebec via Diamond Junction and the Bridge and will not touch at Lefis. The Ocean Limited and the Maritime Express will continue to make their regular stops at Levis and the Quebec connection with these trains will be by the ferry as usual.

This Book will help you
Stop the Leaks
in your Farm Profits
WHAT THE FARMER CAN DO WITH CONCRETE
WE'VE called it "What the Farmer can do with Concrete"—a title that exactly describes it, but does not give any idea of how vital its help is to you. To realize this you've got to understand that Concrete is a big factor in successful farming. Just consider the common leaks your farm is subject to, and how Concrete stops those leaks
Wooden Buildings rot under the stress of time and weather. Repairs cost money Concrete won't rot.
Rats are another source of leakage—they gnaw their way through all kinds of buildings—except Concrete, which is rat proof.
Fire on a farm usually means total loss because of the lack of water-pressure. Concrete cannot burn—another leak stopped.
Disease among your stock is usually due to unsanitary conditions. These conditions can be entirely remedied by building the wells, water tanks, septic tanks and barn floors of Concrete.
There's a type of waste that is peculiar to the farm that is built of old-style materials. For instance, mud was never intended for the paving of a feeding lot. Build your feeding floor of Concrete, and there will not be a single kernel lost.

On Concrete Roads
there is low haulage cost and free access for all types of vehicle—any hour, any day, any season. You are surely using Concrete on your farm—you find it makes for true economy, because it never needs repairs. The same notable feature of concrete makes it the only practical material for economical road-building.
Only by having Permanent Highways of Concrete can the farmer run his motor car or drive his team where and when he please—in quick time and in all weather.

will return many times over the value of the manure used in building up the soil. Barnyard manure is the best general fertilizer to use, both for its plant food value and for its tendency to lighten up tight and clayey soils which drain poorly and remain "cold" until late in the spring. The loose, mellow soil resulting from application of barnyard manure is also essential in growing the root crops, which are likely to be misshapen and istorted in too light and stony soils. oot crops are more easily harvested inn a mellow soil, too. A dressing of three inches of manure is not too much, but it should be well rotted if it is plowed under in the spring.

Garedns that were plowed this fall will show the good effectts of weathering and a reduced number of grubs and other pests that have escaped freezing, as well as the opportunity for rotting o fte manure through the winter. If your garden was not plowed this fall, it should be done as early as the ground is at all fit to work in the psring.

CLEANING GRAIN FOR SEED

In using a fanning mill one must be governed by the condition of the grain he is cleaning. As the different grains have different weights per bushel it is necessary not only to use different sized screens, but also to regulate the wind, shake and speed of the mill to suit the different weights and sizes of grain to be cleaned. The fanning mill will only separate grains or seeds of different sizes or weights. The wind is one of the most important factors. The first thing to do is to examine the grain thoroughly see what other grains, weeds, seeds, etc., there are in it, and make up on's mind as to the best way to clean them out.

In cleaning oats for seed, regulate the machine according to directions on the mill. The first operation consists of blowing out all the chaff. Most of the very small seeds will go through the screen under the hopper, but a certain amount will go through the screen in the lower shoe. To make a perfect job and to get all the larger weed seeds, such as vetches, cockle, wild buckwheat, or even wheat and barley that are not the same size and weight as oats, the grain must be put through once or twice more.

The second cleaning requires quite a different operation. The riddles are to be arranged as for cleaning wheat, and anything of the size and length of wheat should go through the riddles, and the large, long, heavy oats should go over the back of the machine. Care must be taken to see that the proper slant is on the riddles so as to carry the oats over, and all the other grain, etc., down under the mill. In regulating the wind and shake, use very little wind, as you do not want to blow any of the light seeds or small wheat or barley over with the oats; and have very little shake, so that the oatst will not be stood on end and go through, but slide over the back of the machin.

In cleaning wheat for seed, after the chaff and small seeds are all removed take out one or two of the wheat riddles, and open all the wind doors wide. Good, plump wheat, weighing 60 pounds per bushel and over, will take more wind than the average fanning supply. The good, heavy grain cannot be blown over, but all the lighter grains, also oats and barley, ought to find their way over the back of the machine. Care must be taken to use conductors to carry the grain near enough the back of the machine to give the wind a chance. When there is still some small grain or seeds left, it may be sometimes necessary to run the grain through twice. Should white caps in wheat (wheat hulls) be found troublesome to remove, select one of the long screens belonging to the lower shoe—just large enough to let the wheat through—place the screen directly under the hopper, and this will extend far enough back to carry the white caps out over the machine. This long screen will also be found most useful when cleaning oats, whenever there are thistle tops or joints of oat straw amongst the grain.

Man experiments have proven that careful fanning pays many times over for the trouble in cleaning the seed grain. You have pure, clean seed, free from weeds, and the longer and plumper seed produces heavier crops.

THE CUMBERLAND COUNTY POULTRY AND PET STOCK SHOW

The Cumberland County Poultry and Pet Stock Association's first annual show was a success from the word go. This Association was only organized last February and has accomplished great work in that length of time. Their first show opened up on Tuesday, Nov. 27th, with an entry of nearly four hundred birds and good competition in every class. One of the strongest points of the show was that the night previous to the opening of the show every bird was in the building and cooped, and all exhibits were in and completed so that when the doors were opened the show was in readiness.

It was opened on Tuesday night by Amherst Boy Scout Band who rendered an excellen programme. The judging was done by Mr. J. P. Landry of Truro, N. S., who commended the show very highly on the quality of birds exhibited. The following were patrons during the show: Lieut.-Governor Grant, Halifax; His Worship Moyor Pipes; R. I. Black, President Board of Trade; F. C. Elford, Dominion Poultry Husbandryman; F. L. Fuller, Sect'y Maratime Stock Breeder's Association; and all commended the officers highly on the excellent exhibit and way in which the show was carried off.

Mr. R. R. Black, Oxford Junction, was the heaviest exhibitor and won a large share of the prizes. He also won the silver cup donated b the Cumberland Poultry Association. Mr. E. E. Peel, Amherst, carried off the Hon. E. N. Rhodes' Cup for best showing of White Leghorns. Mr. Peel also had an interesting exhibit of hares which were judged by V. G. Fuller, Amherst, on which he won many prizes.

In every way the show was a great success and great credit is due Mr. C. B. Chipman, President; Mr. W. W. Baird, Supt.; and Mr. V. G. Fuller, Secretary for the excellent way in which they handled the show. They are pleased to report that the balance is on the right side.

THE FEEDING AND HOUSING OF SWINE

On account of the high value of concentrated foods suitable for swine feeding, it is important that the foods that are used be so combined as to produce the maximum of results. The question of housing also enters largely into the profitable production of pork. To encourage farmers to raise as many hogs as possible, and to make the most money therfrom, the Department of Agriculture, Ottawa, deals also with the questions of breeding and care of the animals at different ages and at different seasons of the year. This pamphlet is prepared by Professor G. E. Day, in charge of the Bacon Production Campaign, Dominion Department of Agriculture, Mr. E. S. Archibald, Dominion Husbandman, and his Assistant, Mr. G. B. Rothwell.

Mr. Archibald, after much experimental work, lays down the principal that an expensive piggery is unnecessary. Brood sows may be kept under most circumstances even in the winter season in a single board hog cabin. This pamphlet gives specifications and plans, not only of a large piggery, but of a cheap and portable cabin.

RIGHT WAY TO HANG LANTERN IN STABLE

Most farmers know of fires that have started around farm buildings from te overturning of lanterns. We usuall set a lantern down by the side of the barn door while we do the barn work and take a chance. Or maybe we are a little more careful and hang it on a nail.

In a few barns and stables I notice a wire stretched across the rear of the stables. On this farm every once in a while there is a wire hook fastened around the wire and with a hook in the lower end of the lantern bail or handle. Some of trese mey be short and some longer. I have one about a foot long while two others on the same wire are two or three inches.

With the lantern on these hooks, even if some of the stock bump into it, the lantern cannot get loose but will just swing around out of the way. Besides that the hooks will slide along on the wire so that the light is just where you want it no matter what stall you may be working in.

I use number eight wire for this as it holds up better and the hooks are stronger with this size. Some farmerse I notice use a regular harness snap for the lantern to fasten into. This might be better though I do not see how the lantern handle could well get out of either one of them.—Farmer John.

IT PAYS TO TREAT FENCE POSTS

Experiments conducted by the forestry department of the Colorado Agriculutural College, indicate that cheap, shortlived timber such as lodgepole pine, Engleman spruce, balsam, fir and cottonwood or poplar can be made to last enough longer by a simple treatment with some timber preservative, to make it worth while. The best preservative for this purpose is a good grade of coal tar creosote used by the open tank method. Any tank or large can of sheet or galvanized iron, which will permit of heating the lipuid to the boiling point and is deep enough to allow the posts to be dipped to a depth of 30 inches will do.

Posts to be treated should be well seasoned and may be left in the hot creosote for from 10 to 30 minutes, for a short treatment, or from one to two hours for a thorough treatment.

If the posts are allowed to stand in the creosote while it is cooling a much deeper penetration will be secured while, at the same time, the cost per post is increased. The lasting qualities of the post are increased with the deeper penetration of the preservative.

The chepest material tried was ordinary gas tar which has increased the life of treated posts thus far, at least 50 per cent., although it does not penetrate readily. Further time is required to learn its fullest effectiveness from our experiments.—B. O. Longyear.

HUMUS IN THE SOIL

Humus is the decayed and decaying organic matter in the soil. Next to soil moisture, humus is the most important factor in determining the yield of any crop, and it might be placed first, because the capacity of the soil to absorb and hold moisture is directly proportional to its humus content.

Humus adds plant food and makes plant food available. It supplies media in which the soil bacteria live and multiply, causing chemical changes in the soil which make the plant food elements soluble and available to plant roots. It enlivens the soil, giving good tilth and a texture favorable to soil aeration, and to the absorption and holding of soil moisture. It loosens heavy soils and holds sandy soils together, lessens packing and prevents to a large degree soil washing and blowing. It gives the soil its dark rich color, and makes it warmer because the dark color favors the absorption of heat. A soil without humus is a "dead" soil, infertile and barren; in fact, "humus is the basis of soil fertility and a complete soil builder."

Any worm that eats the foilage of trees or plants of any kind can be poisoned by a spray of arsenate of lead. Arsenate of lead is better than paris green because it is not washed off by heavy rains.

50 Acre Farm $1750

Sell cream at door, feed skim to hogs; 200 bbls apples last year; estima ed 500 cords wood; good 10-room bouse; 60 ft. barn and 3 poultry houses for 500 hens; if taken soon retiring owner will include horse, cow and some hay, stove wood and farm tools; $1750 for everything, part down; see page 3 Strout's Catalogue of 321 bargains, copy mailed free. W. H. HENRY
Shubenacadie - - - N. S.

FOR SALE

A handsome, well-grown Guernsey bull. Sire purchased from the Experimental Farm, Ottawa; dam of equally good breeding, and a heavy producer. Will be sold reasonable. Full particulars on inquiry.

SARAH E. MOSES SMITH,
Woodwards Cove, - - - N. B.

Fir Shade Farm Dual-Purpose Shorthorns !

Several years ago I imported from Ontario three Dual-Purpose Shorthorn animals, and now have in my stable at Rothesay eight representatives of this breed. Two of the females are entered in the Record of Performance, and so far bave done excellent work. If you feel disposed you might drop in and see these the first time you are in the vicinity. Perhaps some time when you are coming to the city you would let me know, when I could arrange to go to Rothesay with you.

P. R. L. FAIRWEATHER. St. John, N. B.

FOR SALE !

We have for sale in Shorthorns of milking blood, Roan Bull, 18 months old, large and well built, also several Bull Calves. Heavy and Light Horses.

L. M. ANDERSON,
SACKVILLE, - - - N. B

More Milk—Better Milk

Thorough tests on the Government Experimental Farms show that cows after being dehorned give more and better milk. The KEYSTONE DEHORNER is the most humane and efficient instrumet for the purpose. Write for booklet. R. H. McKENNA, 219 Robert St., Toronto.

Springbrook Farm Ayrshires !

PRESENT OFFERINGS:—Eight nice young Ayrshire bulls, ranging in age from 26 months to 15 months. All these bulls are sired by the Champion Ayrshire Bull of the Maritime Provinces for two years in succession. Also females, all ages.

McINTYRE BROS.
SUSSEX, - - N. B.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Casb must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue which will always be found on the editorial page of the proceeding issie. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex, N. B.

GEESE—Two large Geese and one Gander fit for breeding. The first eight dollars takes them. F. Baxter, Harcourt, Kent Co., N. B.

FOR SALE—Choice Tamworth boars and Collie dogs. J. Titus Barnes, Apohaqui. R. R. No. 3.

BERKSHIRES FOR SALE—Sows bred, boars ready for service, young pigs ready to wean. All choice stock. Write if you want something good. Valley View Farm, Truro, N. S. J. R. Semple & Son.

LADIES WANTED to do plain and light sewing at home, whole or spare time; good pay; work sent any distance, charges paid. Send stamp for particulars.—NATIONAL MANUFACTURING CO., Montreal

CANADIAN POULTRY REVIEW, 41st year of publication. Bigger and better than ever. Departments conducted by specialists. Seventy-five cents year, two years one dollar. Sample free. 184 Adelaide St West, Toronto, Ont.

Willow Glen Shorthorns

Entire show herd for sale. See our record at the recent Halifax show. All prize-winners from three year old cows down bred by myself, and sired by Champion and Sire of Champion Stately Monarch. Write for particulars.

Common Ailments and Diseases of Dairy Cattle

Like all living creatures, the dairy animal is not always in perfect health. Since dairy cattle now live under rather artificial conditions they are no doubt afflicted by more ailments than if living under entirely natural conditions. The old saying "Prevention is better than cure" admits of no more proper application than in the dairy business. Therefore, the aim of all dairymen should be to give that care and attention that will ward off disease, than to depend on his own skill or that of his veterinarian to avoid serious loss from this source. Though the most stringent care cannot always prevent diseases from creeping in, the following of the simple rules of ventilation and cleanliness, the supply of abundance of good food, admission of sunlight and periodic disinfection of stables, will prevent most of the losses that occur in dairy stables from disease.

A discussion of some of the commoner afflictions of cattle that yield to treatment by the farmer, together with causes, prevention and cure, here follows:—

Abortion.—This disease is of two distinct kinds, mechanical or accidental abortion, caused by a fall, a blow, or a hook from another cow, and contagious abortion, due to the presence of a germ in the genital organs of the pregnant cow. The first kind only occasionally happens, and can be avoided only by care in handling the cows to avoid accidents of this kind. The second kind is the scourge of the dairy business. The germ of this disease has extraordinary vitality, which enables it to remain active in the system of the cow from one pregnancy to another, and great power of resistance, which enables it to survive medicinal treatment that does not have actual contact with the germ itself. Because the germ lies in the womb, which is tightly closed except for a few days after calving, it is, of course, impossible to bring the germ in direct contact with disinfectants for the greater part of the year. Therefore, there has not yet been found any course of medicinal treatment to which the disease has appreciably yielded.

The disease usually finds its way into the stable through the medium of a purchased cow that is infected, or a bull that has served an affected cow passing on the infection of healthy cows. The most obvious method of prevention is to avoid the introduction into the herd of either males or females from herds that are infected, and to prohibit the service of outside cows by the herd bull. Should the disease once get a foothold in the herd, the spread of the disease to all the cows is always very rapid, and even with the strictest treatment will take some years to entirely eradicate. There are the best grounds for belief that a cow may carry the affection and yet not abort, being of sufficient resisting power to prevent the disease from operating. It is also believed that when a cow becomes normal, after aborting one or more times, that she still retains in her system the infection, that may be transmitted to other animals. The latest investigation into the disease points to the probability of a heifer calf, born normally from a cow of either of the above kinds, carrying the infection in her system until she herself is of breeding age, when she may abort. The same investigations show that it is possible for a healthy heifer calf to become infected from the milk of an infected cow, and carry the infection until it causes her to abort at the first opportunity. These may explain the lack of success in eradicating the disease that has so far attended the strict methods of isolation, sanitation and disinfection heretofore practised by many dairymen. This would also partially explain the progress of the disease, through practically all badly infected herds; that is, that the infected cows seem to become immune after two or three years, and ensuing outbreaks are usually among heifers and purchased cows.

The only methods of handling an infected herd are isolation of aborting, or about to abort, cows from the rest of the herd, disinfection of stalls and gutters about the infected animals, and burning or burying all discharges and bedding from aborted cows. Added to these is the necessity of flushing of the vagina and washing of the exterior genitals, tail and thighs with an antiseptic solution till all discharges cease. The sheath of the bull should be cleansed with an antiseptic after each service. The best disinfectant for internal work is a three per cent. solution of carbolic acid, phenol or chloral naptholeum, or a ten per cent. solution of boracic acid, which has the advantage of not being so harsh as to cause severe straining, which sometimes is the result from the first mentioned disinfectants. For external use and disinfection of stalls and gutters, etc., a solution of carbolic acid, enoleum, or any other like coal tar product, double the strength mentioned above. For use in disinfecting the stables a two per cent. solution of corrosive-sublimate will also be found very efficient.

One of the frequent results of abortion is temporary loss of the breeding powers of the female. Good feeding and frequent flushing of the vagina, to expedite the healing of the organs after abortion, is the best treatment for this condition.

Just before going to press the Health of Animals Branch of the Dominion Department of Agriculture have issued the following statement regarding experimental work with this disease:—

The experiments which we have been making in the Health of Animals Branch of the Department of Agriculture, with the object of finding a means of controlling contagious abortion in cattle, have resulted hitherto successfully, and I am permitted by the Minister, the Honorable Martin Burrell, to make them public.

Experiment 1. Four heifers, aged 1 year, were inoculated with our protective vaccine January 26th, 1915. The test of the blood of these heifers showed that one of them was already infected with the bacillus of contagious abortion, and all four were living in a herd in which the disease was known to exist.

The four heifers were bred on the following dates: April 21st, April 23rd, April 23rd, and December 18th, 1915. They all calved, the dates being respectively January 26th, January 26th, January 12th, and September 11th, 1916.

Experiment 2. Ten yearling heifers were inoculated March 20th, 1915, four of which reacted to the test for contagious abortion. They were bred after an interval of three months. (Accurate dates cannot be given in this case, as the herd records were destroyed by fire). All became pregnant; eight carried their calves to full term and produced living offspring; two aborted.

Serum and Vaccine

Experiment 3. Four heifers, yearlings, were employed to test a method of employing a serum as well as a vaccine. With the first two, the serum and vaccine were used simultaneously; with the second two, the serum was given ten days prior to the vaccine. When tested, the first two had reacted to the test; the second two did not react. The first two were bred December 16th, 1915, and August 25th, 1915, and both aborted—July 12th, 1916 and April 16th, 1916. The second two were bred December 23rd, 1915, and November 9th, 1915, and produced living calves September 20th, 1916, and August 5th, 1916. This experiment was unsatisfactory and gave conflicting results, but shows that the simultaneous method of giving serum and vaccine did not prevent infected heifers from aborting.

Experiment 4. In this experiment an effort was made to find out how far the vaccine treatment would prevent abortion in cows which had previously aborted.

Eight cows were selected, ranging from two to seven years in age. All had previously aborted, one of them three times, the others once. All but one reacted to the test for contagious abortion. None were pregnant when inoculated nor bred afterwards until some weeks had elapsed. The result showed six cows produced living calves at full term; and one proved to be barren and was slaughtered; and one cow reacted when the herd was tested with tuberculin and was slaughtered, having previously aborted.

The method used in this experiment was a double inoculation with a mild vaccine first, followed by a strong vaccine several days later.

Experiment 5. Four cows, aged two to seven years, and four yearling heifers were used. The cows had all aborted previously, one of them twice, the others once. Three of them reacted to the test for contagious abortion. All were treated by the double method, and were bred, after a suitable interval, with the following result: One of the cows, the one that had aborted twice previously, aborted again. All the others produced living calves.

Should Make Application.

These experiments have resulted in obtaining 27 living calves from 34 cows and heifers in badly infected herds. This encourages us to hope that we have a really useful method of procuring immunity to the disease, and we are anxious to enlarge our experience by extending our work to other herds.

With this object we now offer to treat free of charge a limited number of herds in which contagious abortion is present. Owners are requested to make application in writing to the Veterinary Director General, Ottawa, stating the number of breeding females in the herd.

Applications will be dealt with in the order of their receipt.

F. TORRANCE,
Veterinary Director General.

Bloat.—This ailment is caused usually by a too heavy feed of damp green feed, such as red clover, corn, or rape. The best preventive is to have animals partially satisfied before turning on to such feeds as above, or to drive the animals out before they have had a chance to gorge. In moderate cases a dose of two tablespoons of turpentine in a pint of raw linseed oil will work a speedy recovery. If the case is severe, immediate tapping with a trocar and cannula at a point equi-distant from the hook point, loin edge and last rib on the left side. This should be followed by the dose of turpentine and raw oil mentioned above, and light feeding for three successive days. Tying a short piece of fork or broom handle crosswise in the animal's mouth has also been found to give quick relief.

Blind Teats.—This trouble arises from different causes, but is usually the result of a growth in the milk channel, following an attack of mammitis or garget. It is sometimes caused from a deep wound such as a barb wire cut. Should the trouble commence while the cow is in full milk, little can be done except to milk with a milk tube, kept clean and sterilised, and when the cow goes dry the growth can be partially removed with a teat bistuory. This operation should be performed only by a competent veterinarian.

Bloody Milk.—An injury to one or more quarters of the udder, or an attack of garget, are the usual causes of this ailment. Frequent milking of the affected quarter, and bathing with hot water twice daily, usually effects a

cure.

Cow Pox.—This is a common trouble during the spring when cows are first turned out to pasture, and is usually spread from cow to cow by the hands of the milker. The use of zinc oxide, carbolic salve, or even vaseline and sulphur, after each milking, is the best treatment. When the disease first appears, the affected cow should be milked last to avoid spreading to other animals.

Foul in the Foot.—Sometimes from the presence of dirt between the toes, the animal's foot will become swollen and sore. The foot should then be scraped and washed clean, with a disinfectant, every day, and the foot kept wrapped in a sack containing a gallon of moist bran.

Garget or Mammitis—Garget is well known to all dairymen. The natural swelling of the udder at calving time must not be confused with this disease, which may occur at any time in the milking period. Caked udder is another common name for the trouble. The usual cause is a chill due to cold in the udder brought on by draft or by contact of the udder with the cold damp floor or ground. If taken at the beginning, a cure is usually effected by keeping the cow in a warm dry place and dosing her with Epsom salts, or raw oil. Frequent massaging of the quarter, followed by rubbing with sweet oil, castor oil, or lard, is also to be advised. Should the case become severe, fomentations with hot water three times a day will be necessary. The udder must then be rubbed perfectly dry and camphorated oil rubbed in. This is rather severe treatment, and may cause the temporary drying up of the quarter. The worst cases may require the use of a hot pouultice of flaxseed, bran, or hot wet rags.. The disease, or at least one form of it, is contagious, so that in all cases the milk or fluid from the affected uudder should be drawn into a separate pail and destroyed, and the uudder disinfected externally with a five per cent. solution of carbolic acid.

Inversion of the Womb or Casting of the Withers.—The above words describe the condition where the womb, of calf bed, appears in a large mass, inside out, on the outside of the cow's body. It usually follows a difficult calving, and denotes a breaking or tearing of the ligaments that hold the uterus in its proper place in the body. When a cow has once had this trouble, it is liable to occur again after every succeeding calving. The operation of returning the uterus is a difficult one. To overcome the straining of the cow, tie a quarter-inch rope tightly around the body just back of the shoulder, and another just forward of the hooks. The uterus should then be washed off with clean cold water, with a very small trace of disinfectant. Then the mass can be slowly and carefully forced back into place with the closed fist. An occasional dash of cold water over the parts will reduce the size by driving out part of the blood. To hold the uterus in place after being returned, the lips of the vulva should be stitched for a couple of days. Or, after placing a tight surcingle around the cow's chest, two small ropes may be brought from it over the cow's back, on each side of the tail, crossed or knotted just under the tail and brought down, one on each side of the udder next to thighs, and tied tightly to the surcingle under the chest. Then the cow's hind feet should be raised six inches higher than her fore feet, for about a week.. If cows, heavy in calf, acquire the habit of standing back in a deep gutter, the gutter had better be filled up level to avoid bringing on this trouuble.

Lice.—These pests are difficult to eradicate in a stable. Tney often have a good foothold before they are noticed, particularly on animals with long, thick hair. They show their presence by the unthrifty dry appearance of the coat and loosening of patches of hair. Two good washings of the whole animal, with a five per cent. solution of Creolin, Zenoleum, or crude carbolic acid, about ten days apart, will kill most of them. Dusting the roots of the hair thoroughly with a mixture of hellebore and dry cement is also efficacious. If the hair is very long and thick, it will often pay to clip the animal before treating.

Lump Jaw.—This is a hard growth or swelling close to the bone of the lower jaw. As it is very infectious the animal should be isolated from the other cows before the swelling bursts. The only known remedy is a dose of two drams of iodide of potash in half a pint of water given every day foi seven days. If the swelling does not reduce in that time, repeat the dose. In the case of a valuable animal, treatment may be worth while.. An ordinary one might better be slaughtered as soon as the disease is noticed, as the meat can then be used. It is contrary to law to sell meat from an animal in the advanced stages of the disease.

Milk Fever.—Parturient apoplexy is another name for the same disease. This trouble affects only heavy milking cows within a few days after calving. It never attacks a heifer at her first calving, and rarely is it found if the calf is allowed to run with the cow for the first week. It rarely attacks a cow whose bowels are in a laxative condition and which is being lightly fed on laxative foods and if the cow is not milked out clean during the first three days the disease seldom occurs.

The symptoms are: loss of appetite, uneasiness, and partial paralysis of the limbs, or inability to rise or walk. Soon the cow goes down in an unconscious or semi-conscious condition. As the cow has difficulty in swallowing, she should never be drenched while in this condition, as all or part of the liquid may flow into the lungs and cause almost certain death. Of late, the disease has been found to yield readily to the air treatment. This consists in pumping the quarters full of air and confining the air by tying the teats tightly with tape. This may be done with a bicycle pump, or a rubber atomiser bulb, attached by a piece of rubber tubing to a milking tube, or by the use of a special milk fever outfit of much the same nature, in which the air has to pass through a chamber filled with medicated cotton. The teats should first be partly milked out, then washed off. The tube to be inserted should also be clean and sterilized. Air may be pumped into each teat till well distended, then the teat should be tied with a tape to prevent its escape. One injection will usually be found sufficient, but it may be repeated if necessary.

Paralysis of the Bowel.—This disease sometimes attacks cows during the first few days they are turned out to pasture. It is supposedly caused by lying on the damp cold ground. The cow refuses to eat anything, though she shows no pain at first, and gradually becomes weaker and weaker through lack of feed. In three or four daays she will go down, will be unable to rise, and in a day or two will usually die in great agony. Unless taken at its inception, the disease is fatal. Strong stimulants, such as nux vomica, sulphate of iron, and bichromate of potash administered by a veterinary will sometimes work a cure at this stage.

Pneumonia.—Inflammation of the lungs, as it is commonly called, attacks cattle only in cold weather. The symptoms are lack of appetite and ambition, rapid breathing and a crackling sound in the lungs, heard when the ear is applied to the chest. The disease is usually ushered in with a severe cold, followed by high fever. A veterinarian had better be called in, and the animal placed in a dry stall, not necessarily too warm, but free from draughts. The animal is not likely to eat, but she may take a bran mash of boiled potatoes. The medicine given should consist of a pint of raw linseed oil at the beginning, followed every three hours by a quart of thin flaxseed gruel and two ounces of whiskey. A good strong mustard blister over the lung, left on two hours, will help relieve the pain. The animal should be kept blanketed and free from draughts till fully recovered.

Retention of the Afterbirth.—The cause of this disease has never yet been ascertained. It attacks calving cows in all the varying stages of bodily condition, age, and breeding, at all times of the year, and in all weather. It is found after most cases of abortion or abnromal births. If the afterbirth does not come away within twelve hours after calving it will not come away naturally. To avoid the poisoning of the system by the decay of the tissues of the afterbirth in the womb, it is necessary to remove them. This should be done by at least the third day after calving. After providing himself with a pail of warm water, in which is a disinfectant, the operator should strip to the waist, wash his hands and arms in the water, and coat them with some oil, vaseline, or lard. The arm should then be inserted in the vagina, and the hand follow up the plaacenta into the womb until the first attachment is reached. This is a bulbous button-like projection, or cotyledon, from which the placenta can be separated by the finger and thumb. Follow up the placenta until the tissues are all removed from the cotyledons, at all times exercising a steady pull on the end of the placenta hanging from the cow. This is a hard, tedious operation, but should be done with as little roughness as possible, to avoid bleeding at the cotyledons. After removal of all parts of the afterbirth, the uterus must be flushed out with a gallon of warm antiseptic solution. For this purpose a solution of boracic acid is advised as it is not so harsh and causes less straining. A milk solution of carbolic acid, about two per cent., will also be efficient. If there is any discharge, a second flushing out inside of forty-eight hours is to be advised.

Ringworm.—This is a fungus growth more often found on calves than on mature animals. Treatment consists in painting with iodine, or a couple of applications of sugar of lead and cream, one to four parts by weight. Kerosene oil will often work a cure, but leaves the surface raw, and retards the growth of the new hair.

Tuberculosis.—This disease is much more common in our Ontario herds than is usually supposed. This is due to the fact that animals well fed and cared for do not show any outward indications of the disease, until the disease has reached the well developed stage. There is no known cure for the disease, and treatment consists only in preventing its spread to healthy animals. The presence of the disease is indicated only by the application of the tuberculin test. Every farmer would be wise to test all his cattle at least once a year. If only a few animals react, they should be disposed of to avoid infecting the balance of the herd. In its first and middle stages the disease does not usually affect the sale of the meat. If quite a number react, so that immediate disposal would cause a severe loss, all possible means should be taken to isolate the reacting ones from the healthy cows, both in the stable and in the pasture. The calves from diseased cows are always born healthy, and, if removed at birth from contact with the mothers, and fed only the milk from healthy cows, they will be as free from the disease as calves from dams thata have no tuberculosis.

Warbles.—These lumps, that develop on the backs of cattle, just under the skin, are the larvae or grubs of a bot fly that lays its eggs the previous summer. Turpentine, or a mixture of one part sulphur to two parts lard, smeared on the lumps will kill the grubs as soon as they make an opening in the skin. Large warbles can be squeezed out by hand, and destroyed.

White Scours in Calves.—This is an infectious disease attacking young cows. Though due to the presence of a germ in the digestive tract, it rarely occurs where proper cleanly methods of feeding are practised. The symptoms of the disease are loss of appetite and energy, slight bloating, and an offensive white color to the manure. An immediate purgative of two ounces of castor oil is necessary, and the feed should consist of warm whole milk till the trouble abates. Many dairymen report good success from feeding in the milk a couple of tablespoonfuls of a mixture of one half ounce formalin in twelve ounces of water. Cleanliness and regularity in feeding, however, will always avoid trouble of this kind.

The Medicine Chest

The foregoing discussion on the treatment of diseases demonstrates that most of the common ailments can be successfully treated if the farmer has on hand a few of the simple remedies that are recommended for use in this connection. Every stable should be supplied with the following drugs, kept in a locked cupboard, each separate kind being distinctly labeled to avoid mistakes.

Purgatives and Laxatives

10 lbs. Epsom Salts. 1 lb. Ginger. 1 gal. raw linseed oil. 1 quart castor oil.

Applications to udders and teats

½ pint olive oil. 1 lb. lard. 1 pint camphorated oil. 1 lb. vaseline.

Bloating

1 pint of turpentine.

Disinfectants

1 lb. carbolic acid. 1 lb. boracic acid. 1 gal. Zenoleum, Creolin or Chloral Naptholeum.

Tonics and Stimulants.

½ lb. Sulphate of Iron. ½ lb. Gentian. 1 pint whiskey or brandy.

For Dehorning Calves

½ doz. sticks Caustic Potash.

In addition to the above, the following appliances for treatment of diseases and the administration of medicines can profitably be included:

Drenching bottle with long neck. Trocar and Cannula, for bloating. Graduated measuring glass. Milk fever apparatus. Clinical thermometer. Inejction pump, of 6 ft. half-in. rubber hose with glass funnel. Hard rubber syringe. 3 milking tubes. Set of hand clippers.

LICE AND WORMS LESSEN PORK PROFITS

Lice are the sure enemy to profits on the hog at all seasons of the year. They crawl over the body and bite him after night till he cannot sleep. They scurry through his bristles by day till he cannot forage his living. The bite is poisonous and gradually saps away the vitality of the most thrifty looking shoat in the face of heavy fceding. This poison acts upon the nervous system of the hog just as it would on a human being and he becomes nervous and irritable. A good hog oiler with a good supply of oil will kill the lice and mites and soothe that itching irritation that destroys all the foundation for prolts.

Worms are another source of great loss in the hog lots. There are several commercial worm killers on the market, but there is a cheaper remedy if we will only use it. A little turpentine mixed with a good bucket of slop once a week will clean out the worms in great shape. Just a teaspoonful or two will do the work—just enough so the hog will not go back on drinking the liquid to the last drop. Lice and worms are two very unproltable factors in th ehog lot and the two together we suspect have caused more cholera scares than all the other things put together. They undermine the constitution and so weaken it that the animal falls an easy prey to whatever riseases comes along.

OLIVER HECK.

N. S. Dairymen's Annual

Splendid Meeting of the Butter Producers--Large Increase in the Production of 1917--More Yet to be Done.

The annual meeting of the Nova Scotia Dairymen's Association was held at Truro on January 10th and 11th. There was a large attendance, practically every creamery in the province being represented. The convention opened with an evening meeting on the 10th, which was presided over by the president of the association, Mr. D. W. Murray, Scotsburn. Addresses were delivered by Messrs. W. A. McKay, Prof. Cumming, Prof. Trueman, D. J. Cameron, butter inspector, Ottawa, and others. The butter judging contest was held on Friday morning and the afternoon was devoted to the business of the association.

The summer butter competition brought out some splendid exhibits. This competition ran for its third year. The conditions are severe. Competitors are required to ship butter on a date selected by the Dairy Superintendent to cold storage, Halifax. A telegram is sent to each competitor and the butter must be delivered at Halifax within 72 hours. This prevents selection of stock. The goods are reshipped to Truro for competition at the convention. The judges this year were Messrs. Harvey Mitchell and D. J. Cameron. The showing this year was most meritorious. The big cup offered went to the Scotsburn Creamery, Scotsburn, N. S. Previous winners in this competition were 1916, Brookfield Creamery; 1917 LaHave Creamery, Bridgewater. The cup must be won three times before becoming the property of any competitor. The scores in this interesting competition, which are published in this issue, show how the standard of the Nova Scotia creameries has been fixed.

The other competitions were also interesting and the results are given elsewhere.

In regard to the general growth of the dairy industry of Nova Scotia, the general remark may be made that the outlook is most encouraging. During the year there was an increase of 175,000 pounds. This, however, leaves much to be done. One Halifax firm alone has been buying 1,000,000 pounds of butter per year outside of the province and it is the aim of the capable head of the Nova Scotia branch, Mr. W. A. McKay to end this by producing sufficient butter to serve the provincial demand. From a production of $40,000 in 1907, the output has grown to approximately a quarter of a million dollars in 1917, an increase which reflects the greatest credit on Mr. McKay.

In a later issue the Maritime Farmer will publish the text of some of the fine addresses given at the conference.

REPAIRING THE ORCHARD

The season for overhauling the orchard is rapidly approaching. Some farmers do not realize the necessity of going carefully over every tree and giving it a certain amount of repairing. Nevertheless, it is all important and time spent in this way will yield a good profit.

The heavy crops of apples of the previous autumn may have split or cracked some portion of the trunk or a limb may have become partially detached from the main body of the tree. An iron rod with large washers on each end placed through the limb and parent trunk may prolong the life of this limb for many years. The rod should be made sufficiently long, so that the future growth will not be interefred with. Wounds caused by pruning knife or saw should receive careful attention. It may be that some old wounds have not healed and decay has set in. The decaying wood should be cut out and the space filled with some waterproof substance, as cement.

The storms of winter may have caused damage, large limbs may have been broken off and the bark of the tree injured. All splinters and stubs of limbs should be trimmed with the pruning saw so as the moisture can not collect on the damaged surface and start decay.

In young orchards and even in fairly old plantations there is always a danger of girdling from mice or rabbits. The life of many trees can be saved where this has happened if prompt measures are employed. As an instance of this let me tell of a tree that came under our observation a few years ago. This Talman Sweet tree was about fifteen years old, and had been bearing for some time. It was valued quite highly by its owner, but was almost completely girdled and he expected it was lost. An old orchardist was consulted and he instructed the man to bridge-garft the injured parts and to trim back the top. This was done and the tree continued to live and today is apparently as healthy as ever.

In order that anyone can inetlligently repair trees of any description it is important that they understand something of its life and manner of growth. To quote an article that recently came to my notice.

To many of us the structure, growth and physiology of a tree are practically unknown. We have a vague notion about trees adding a new ring of wood each year. The trunk of a tree seems to us to be mainly useful to hold up the leaves, and we talk about the roots taking moisture from the soil and feding the tree.

"As a matter of fact, the mineral salts and the water that the roots take up the in such crude form that they are fo no use whatever to the tree until they have been through what is really a digestive process. This process takes place in the leaves so the trunk of the tree must act as the circulation medium for the leaves and again for the digested sap to flow back and give nourishment to all the living cells, even the roots.

"The crude stream flows upward through an inner circle of the tree trunk, and the digested stream flows downward through an outer circle. It is this outer portion of the trunk, that gives the added layer of new growth to the tree. This vital circle lies just next the bark, and is called the cambium. A cross section of a tree shows this to be softer and more moist than any other part.

"Being thus soft and lying so near the outer surface, it is naturally liable to injury, and the injury of this most vital part means danger to the tree. With these few simple facts in mind, it is easily seen why tres should be protected from the teeth of horses carelessly hitched to them, why guy wires should not be fastened to them, and why all the other brutal abuses of trees should be taken in rand by law if necessary.

"Natuhe has her own way of healing tree wounds, whether made by man's carelessness or by severe storms. When a limb is broken off the exposed bit of cambium receives a generous supply of the sap, and because this sap gives growth it at once sets to work to repair the part destroyed. It forms a fold or lip about the wound which gradually covers and protects it.

"The great danger to a tree is not in losing a limb, but in having a wound made in which water can stand and cause decay, or in which injurious insects can find lodging. Nature heals the wounds wisely, but she cannot heal it rapidly enough to eliminate these dangers, and this is where man's skill comes in to hasten the process of healing."

VETERINARY ADVISER

Veterinary Editor,—"I am in need of a good reliable "Veterinary Adviser." Kindly give me information regarding such a book.—J.R.Dundas, Ont."

It is hard to recommend a work on veterinary science for the average stock owner, as a person who has had no special training is not able to distinguish diagnostic symptoms. Probably the best work for the purpose is "The Farmer's Veterinary Adviser."

SUNLIGHT AND AIR FOR LIVE STOCK QUARTERS; PRECAUTION IS NECESSARY AGAINST THE SPREADING OF DISEASE

Fresh air and sunshine in the stable come high but must be provided if the livestock is to be kept in health during the long period of confinement that occurs with every winter season in the northern latitudes. The usual method of providing heat by crowding a large number of animals into a small stable—too often dark and damp in addition—must be given up in favor of greater space per ead, more windows and a thorough system of ventilation and drainage. The spread of tuberculosis in cattle can usually be traced to the system of overcrowding, accompanied by the exclusion of sunlight from the stables, and statistics show that the disease is much more common in the North, where close stabling is necessary throughout the winter, than in the South, where cattle winter more or less outdoors. Milch cows are more susceptible to infection than are steers owing to the constant strain of milking, which weakens their constitution to some extent, and it is most important for their protection and as a safeguard to the people using the milk as food, that cattle of the dairy herd be kept unquestionably healthy.

A free use of the tuberculin test, followed by the killing of all reactors would go a long way in ensuring the health of future generations of farm animals of several classes and would prove, in a few years, a great saving to livestock owners in general. Thanks to the fact that hogs are killed for the greater part, at an early age, tuberculosis in these animals does not develop sufficiently to be recognized, or is confined to parts of the body in such a manner that the greater part of the carcass will pass inspection; yet the records of a packing plant in Wisconsin for 1916 show that 24 per cent of the hog s slaughtered were found on post-mortem examination, to be affected with tuberculosis, and it has been found that much of this trouble in hogs occurs in herds that have followed affected cattle in the feed lots or have been fed raw skim milk from cows affected to some degree.

Since pasteurization of all milk intended for human consumption is enforced in many cities at the instigation of health officers who have a thorough understanding of the importance of this precaution for the maintenance of the public health. it stands to reason that milk producers who feed by-products such as skim milk or buttermilk to their stock should adopt the system of pasteurization of these by-products for the protection of their animals. If milk is heated to 146 degrees and held for 20 minutes or heated to 180 degrees and held for one minute, the tubercular bacilli are killed and the product made safe for man or beast. This precaution, together with proper attention to drainage, ventilation, admission of sunlight to livestock quarters would reduce loss from disease of all kinds to a minimum.

THE DAIRY OUTLOOK

The opinions of many breeders and others who are actively associated with conditions regarding the present dairy situation have been expressed repeatedly. Without a doubt this question is foremost in the mind of the thoughtful dairy farmer who derives his main income from the herd of good producers he has built up. This, of course, is as it should be.

The question arises as to just how serious this problem is right now, and D. H. Propps of the Agricultural College of Newbraska brings out some arguments and statistics which give an encouraging outlook to the future of the dairy industry. From all sections reports come that dairy cws are being sold off in large numbers and this action in a very short time will have a decided effect on the future of the industry. However, if we stop to consider, would we not in all probability agree with Mr. Propps when he says that in most instances these cows which have been sold have been the ertra poor producers and in many cases the other extreme—the real good producers —are being bought for dairy purposes? Of course this sort of action woul dcause a material decrease in dairy products at a time when they are much needed, but in view of the fact that in a good many instances the prices received for these products are not commensurate with the costs incident to production, a great many breeders are doing only the proper thing when they dispose of the poorer animals.

WHERE CANADA MIGHT BENEFIT

In the aged Shorthorn cow class at the Chicago International and at all leading American shows, in fact, it is stipulated that cows must be shown with calf at side nursing. The sight of a dozen great matrons coming forward in this class, each with a husky youngster at foot, was striking to a Canadian spectator. In Canadian showrings no premium is placed on the breeding ability of a cow; in fact, she stands a better chance of winning if she has no calf, simply because she is usually in better condition than a cow nursing a calf. To see a big, fat barren cow pulling down good money year after year simply because she is fitted for the occasion is an economic waste at any time, but a most undesirable procedure in time of war.

The wisdom of this American regulation when contrasted with our own is obvious in the extreme. The idea from the other side is a practical, profitable and highly commendable one. It places a premium on the individual and her ability to breed, two fundamentals in herd building. Our system is extravagant, unprofitable and undesirable, because it fails to recognize the practical aspects of showyard influence. It encourages the fitting of good females to a point where their breeding propensities are destroyed. It places upon a cow the value of a breeder when actually her value is limited to her market selling price as beef.

We understand that this regulation applying to Shorthorns is soon to be extended to the Hereford and Angus breeds. This recommends its merit. We in Canada may well benefit by the suggestion, especially at our larger shows. It would mean a substantial increase in entries, and would remove from our shows one of their most detrimental features.

"JUST FIGGERING"

Keep your lead pencil busy this month closing up the year's records. This is the best paying job you can do. Anyhow, you have got to do it to make out your returns for 1917. The farmer's best friend is a lead pencil, persistently employed in making black entries on the white pages of an account book. It will make you rich if you let it. Lack of an active, accurate, truthful lead pencil has cost many a man his farm. Be sure, this January to make a record of everything you own and everything you owe. Compare this with the similar inventory a year ago. Even without further accounting, you will then know how much you have gained or lost during 1917.

TWO AND HALF CENTS AN ACRE IS COST OF SURVEY

Two years ago, New Brunswick inaugurated a survey to find out just what it possessed in the way of forest resources. To date, 1,200,000 acres have been covered, of which 600,000 were surveyed this year at a cost for the field work of only 2½ cents an acre. The J. B. Snowball Company is co-operating with the Provincial Government by making available to it the information which the company obtained in a survey of its forest properties.

The estimated amount of spruce and balsam in New Brunswick is only about 30 times the present annual cut for lumber and pulpwood. One of the principal objects of the survey is to manage the forests on a permanent basis so that no more than the annual growth will be cut each year. Coniferous species are being heavily over-cut as compared with hardwoods.

* * *

HOW TO ADVERTISE

John Wanamaker once said if there is one enterprise on earth that a quitter should leave severely alone it is advertising. To make a success of advertising, one must be prepared to stick like a barnacle on a boat's bottom. He should know before he begins that he must spend money —lots of it. Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game. It begins very gently at first, but the pull is steady. It increases day by day and year by year until it exerts an irresistible power.

* * *

Clean all grain well before seeding next spring.

* * *

Too many country homes are unattractive on account of their untidy and ill-kept appearance.

* * *

Clean up the rubbish this fall and burn. Rubbish piles make convenient hiding places for vermin.

Glace Bay Poultry Show

The fifth Annual Show of the Glace Bay Poultry Association was held in Alexandra Rink on Nov. 23, 24, 26, and was very successful, both in number and quality of exhibits; in fact, although the numbers were no greater than in some previous years, the quality of the stock show was much improved. With the large floor space available it was found possible to coop all the birds in single tiers on one level with large aisles between the rows, and the splendid lighting showed them off to excellent advantage.

A new feature, and one that created much interest, was the exhibit of dogs held in connection with the poultry show.

The Dominion Government Egg Exhibit in charge of Mr. Poirier, former an interesting and instructive feature of the show. It depicted the results obtained by the old fashioned, hit or miss method of poultry keeping in comparison with the modern methods. Mr. Poirier proved to be one of the boys and made many friends, who will hope to see him at our next show. He tried very hard to take the Club pet lamb home with him, but was not successful. Better luck next year old man.

A model poultry house, constructed by one of the Association members, was on exhibition and was examined by large numbers. It was furnished completely with roosts, dropping board, dust bath, trap nests and feeding appliances and was designed to accommodate twelve hens.

Refreshments were served in a large heated tent in the building and this tent was well patronized by the members and the visiting poultrymen.

This show is without doubt the most successful that has been held in the Maritime Provinces this year. Many who sent to Ontario and the U. S., and paid a long price for birds, were surprised to find that they were not good enough to win against home bred stock.

Mr. Edgar Muggah was manager and proved to be efficient and courteous. He was on the job fifteen hours a day and gave satisfaction both to the exhibitors and visitors, and was ably assisted by the executive and members of the Association.

The judges were Mr. W. H. Henry, who judged the Reds, Houdans, Breeding Pens and Waterfowl, and Mr. J. P. (Joe) Landry, who placed the awards on the remaining classes.

Mr. Landry's Classes

Brahmas—A rather small class of fair quality.

Barred Rocks—One of the largest classes with good quality birds show in poor condition. 1st Cock good type bird, nice barring. 2nd, poorer in barring, but shown in better shape. Hens were well barred, but under weight. 1st Cockerel extra good quality, but poor condition. 2nd and 3rd not so good. Pullets were also of fine quality.

White Rocks—First Cock, extra good quality and type well shown and fit to win in any competition. 2nd under size. Hens, an even lot of good quality, well shown. 1st Cockerel. This bird was awarded silver cup as best cockerel in show. He was of splendid quality and good type. 2nd and 3rd, large birds, carry their tails high. 1st and 2nd pullets, good birds, well shown. 3rd. Good bird but out of condition.

White Wyandottes.—A large class of the best quality. The winners were shown in perfect condition. 1st Cock good type, white and in perfect feather. 2nd and 3rd close up; 3rd losing to 2nd on comb. 1st, 2nd and 3rd hens good quality and perfect condition. 1st Cockerel, a typical bird, well feathered. 2nd very close up. 3rd not so well shown and poorer in head. 1st pullet good size, won over the others in comb.

Single Comb White Leghorns—A large class of beautiful quality and winners all in perfect condition. 1st Cock a beautiful bird in full feather, with nice long back, low well carried tail and excellent head points. 2nd close up but not so smooth in sweep of back and tail. 3rd a large very well furnished bird, lost on comb and lobes to others. Hens a nicely shown lot, low tailed and rather straight in back. Cockerels an even lot. 1st, a larger bodied bird than others. 2nd immature, but a very promising bird. 3rd a better furnished bird than either of the preceding ones. Pullets a good lot, the winners were more mature than the others in class.

Rose Comb Whites.—This was the largest class in show, and produced some excellent specimens. 1st Cock, a nice large, long bodied bird with good head points, carried tail rather high. 2nd, a beautiful type of bird, but undersized. Hens a nice even lot. All the winners were pen mates and very close in quality. 1st Cockerel, a nice typical leghorn, not finished, will make a good bird. 2nd, not so well matured as 1st, but nice type and good head points. 3rd a large bird, rather coarse in head points. 4th and 5th very nice type, but small, not fully grown. Pullets a good lot. 1st pullet more fully matured than others. 2nd and 3rd very close up. The remainder good birds, but not finished. All this class is inclined to high tails.

Singe Comb Brown.—A small entry of fair quality.

Rose Comb Brown.—A small class. 1st Cock good color, nice striping. 2nd smaller bird. Hens nicely colored, good type, well spread tails. 1st Cockerel a nice bird with fair color. Pullets a good lot.

Buff Leghorns.—A small class of very good quality, especially 1st Cockerel.

Rose Comb Black Minorcas.—1st Cock good quality, size and carriage. Hens good. Young stock very nice birds.

White Orpingtons.—No old stock shown. Young stock rather immature, but fair quality.

Buff Orpingtons.—Hens good color, under weight. Young stock also under weight, but good color and type.

Anconas.—A rather large class of good quality. 1st Cock a nice large bird, rather coarse in head with too much white in wing and tail. 2nd, a nice type bird, not enough mottling and rather small. Hens good in size and type, but inclined to too much white in body. 1st Cockerel, typical in shape and color but not matured. Will make a very nice bird. 2nd too much white. 3rd, not enough mottling. Pullets. All the winners were very nice birds, well mottled and carrying low, nicely spread tails.

Dark Cornish.—An excellent class, typical in size and color, one of the best classes in show, put down in great condition. 1st Cockerel was runner up for best cockerel in show.

White Faced Black Spanish.—A nice class of good birds.

Golden Polish.—A small class of very good specimens.

Columbian Wyandottes.—Small class of good quality.

Partridge Wyandottes.—A small class. The old stock was very good, but the young stock was weak in under color.

Mr. Henry's Classes

S. C. Reds.—A large class of excellent quality. 1st Cock, a bird of the finest quality, even dark top color and dark under color, fine type. 2nd and 3rd, also good birds. Hens good quality all through. Cockerels nice quality birds. Pullets very good.

Rose Comb Reds.—A large class of good quality. The old stock a nice even lot. Cockerels a good lot, but not matured. The pullets were extra good with splendid coloring.

Mottled Houdans.—A rather small class of excellent quality. 1st Cock a nice bird with good type and color. 1st Cockerel a nice large typical bird, with beautiful crest. 1st Pullet very nicely mottled.

Pekin Ducks, a very good class of large birds.

Rouen Ducks.—Also a good class, the winners in old stock being beautifully colored. The Aylesbury, Runner and Cayuga classes were small but good quality.

The awards follow:

Light Brahmas: A. F. Miller, 1st Cock, 1st and 2dn Hen, 1st Cockerel, 1st and 2nd Pullet; Frank Coleman, 2nd Cock.

Barred Rocks: Edgar Muggah, 1st Cock, 1ts, 2nd and 3rd Hen, 1st, 2nd and 3rd Cockerel, 1st, 2nd, 4th and 5th Pullet; Alfred Springhall, 2nd Cock, 4th Cockerel; John Shank, 3rd Pullet, 5th Cockerel.

White Rocks: John A. MacLeod, 1st, and 2nd Cock, 1st and 2nd Hen, 1st and 2nd Cockerel, 1st, 2nd and 3rd Pullet; Ben Leitchfield, 2nd Cockerel.

White Wyandottes: B. J. Sutton, 1st, 2nd and 3rd Cock, 1st, 2nd and 3rd Hen; 1st and 2nd Cockerel; 1st, 2nd, 3rd, 4th and 5th Pullet; M. W. Buchanan, 3rd Cockerel.

Columbian Wyandottes: J. W. Munn, 1st Cock, 1st and 2nd Hen, 1st and 2nd Cockerel, 1st, 2nd and 3rd Pullet.

S. C. White Leghorns: Chas. Johnston, s1t and 2nd Cock, 1st, 2nd and 4th Hen, 1st, 3rd and 4th Cockerel; L. Gillis, 3rd Hen, 3rd Cock, 2nd Cockerel, 2nd and 3rd Pullet, 1st Pen; David MacBeth, 1st Pullet; John MacDonald, 5th Hen; James MacLeod, 4th Pullet.

R. C. White Leghorns: Frizzell and Mattinson, 1st Cock, 1st, 2nd and 3rd Hen, 4th and 5th Cockerel, 1st, 2nd, 3rd and 4th Pullet, 1st Pen; Malcolm MacGregor, 1st Cockerel, 5th Pullet; Daniel Tutty, 2nd Cock; John A. McDougall, 2nd Cockerel; Ben Leitchfield, 3rd Cockerel.

S. C. Brown Leghorns: Rev. T. P. Draper, 1st Cock; William Rankin, 2nd Cock, 1st Hen; Leighton Grant, 1st Cockerel. 1st and 2nd Pullet; Harold Sikes, 2nd Cockerel.

R. C. Crown: Ben Leitchfield, 1st Cock, 1st and 3rd Hen; Rev. T. P. Draper, 2nd Cock, 2nd Hen; H. Warner, 1st Cockerel; Douglas Lawley, 1st and 2nd Pullet; James Derbyshire, 2nd Cockerel; H. H. Hull, 1st Pen.

R. C. Black Minorcas: Oscar Haase, 1st Cock, 2nd Hen, 2nd Cockerel; Rev. T. F. Draper, 1st Hen, 1st Cockerel, 1st and 2nd Pullet.

Buff Leghorns: Carl Haase, 1st Cock, 1st and 2nd Hen, 1st Cockerel.

White Orpingtons: Geo. Hopewell, 1st Cockerel, 1st and 2nd Pullet.

Buff Orpingtons: Morris Feldman, 1st and 2nd Hen, 1st Cockerel, 1st Pullet.

S. C. Anconas: H. H. Hull, 1st Cock, 1st and 2nd Hen, 1st and 3rd Cockerel, 1st Pullet, 1st Pen; W. Sherriff, 2nd Cock; A. D. MacCuish, 3rd Pullet; Jas. Derbyshire, 2nd and 4th Pullet.

Cornish: Louis Gordon, 1st Cock, 1st and 2nd Hen, 1st Cockerel, 1st and 2nd Pullet; Percy Gordon, 2nd Cockerel, 3rd Pullet.

S. C. Reds: Wm. McLeod, 1st Cock, 1st Hen, 1st Pullet; J. W. Munn, 2nd Cock, 2nd and 3rd Hen, 1st, 2nd and 3rd Cockerel, 2nd and 4th Pullet; Malc. MacGregor, 3rd Pullet; John MacDonald, 5th Pullet.

R. C. Reds: R. W. Carmichael, 1st Cock, 1st Cockerel; John MacNeil, 2nd Cock, 4th Pullet; Neah Fairley, 1st Hen; A. D. Reid, 2nd and 3rd Cockerel, 1st, 2nd and 3rd Pullet.

Black Spanish: S. Keith, 1st Cock, 1st, 2nd and 3rd Hen, 1st Cockerel, 1st Pullet.

Golden Polish: A. Gay, 1st Cock, 1st Hen, 1st Cockerel, 1st Pullet.

Japanese Bantams: Archie MacLean, 1st Cock, 1st Hen.

Black Cochin Bantams: Douglas Lanley, 1st Cock, 1st Hen.

Guinea Fowls: Alfred Springhall, 1st Cockerel, 1st Pullet.

Butter Cups: Michael MacNeil, 1st Cock, 1st Hen.

Jungle Games: Jas. MacDonald, 2nd Cock, 2nd Hen.

Utility Pairs: L. S. Jackson, 1st Hen; Florence Bagnell, 3rd; Edgar Muggah, 2nd; Alex. Brown, 1st Cockerels; Florence Bagnell, 2nd; R. W. Carmichael, 1st Pullets; Wm. MacLeod, 2nd; Alex. Brown, 3rd.

Pekin Ducks: J. M. Davis, 1st Male Sr., 3rd Male Jr.; Robert Crolt, 1st Male Jr., 2nd Female Jr.; Chas. Moffatt, 3rd Female Jr.; H. H. Hull, 2nd Male Jr., 1st Female Jr.

Rouen Ducks: John McKay, 1st Male Sr., 1st Female Sr.; Ben Leitchfield, 1st Male Jr., 1st Female Jr.; Daniel Tutty, 2nd Male Jr., 2nd Female Jr.

A. O. V. Ducks: Morris Foldman, 1st in all sections; Archie Shere, 2nd Male Jr., 2nd Female Jr.

Indian Runner Ducks: J. M. Davis, 1st Male Jr., 1st and 2nd Female Jr.

Bronze Turkeys: Jas. McKay, 1st Male, 1st Female.

Fan Tail Pigeons: A. Gay, 1st Pair; Homer: Noah Fairley, 1st Pair. Clifford Gates, 2nd. A. O. V. Pigeons: Archie Shore, 1st and 2nd pair.

Belgian Hares: Wm. MacKinnon, 1st Male and Female.

Flemish Giant Hares: Carl Haase, 1s tMale and Female.

Silver Black Siberian Hares: W. T. Mattinson, s1t Male and Female.

AT WHAT AGE SHOULD YOUNG SOWS BE BRED

No definite age can be named as being the proper time to breed a young sow. The question is much more one of maturity than one of age or size, and while theyoung animal need not necessarily be full grown, she at least, should have attained to that stage of life when all her powers are strong and well on toward development. In different breeds and in different individuals this will vary greatly.

A young sow being raised for breednig purposes should not be fed heavily enough to produce very rapid growth as it frequently does not make for the best results where animals are carried over from year to year, but in the pig intended for bacon, which has only a few months to live anyhow there is not much danger in so short a time of weakening their constitution by over-feeding.

If a sow is giving proper food and plenty of exercise to keep her growing fast, without laying on too much flesh, she should be ready to breed at about ten months old; some perhaps younger, while others should be older, largely acording to the way she has been managed and the individual characteristics of the sow. She will then be a little over a year old when she farrows, which is soon enough, particularly if she shall be expected to raise two litters a year after she begins to breed. If only one litter is expected of her the first year, which is all that she shoulud do, she coulud then be bred a little earlier if desired.

The effect of breeding a sow too young is to weaken her constitutionally and prevent her from getting a normal growth. To delay a month or so is of little moment as compared with putting a handicap on a sow for all the balance of her life and one should be careful not to err in that direction as mistakes made at that time are not easily atoned for and will be of life-long importance if made in connection with the first litter of pigs.

Dairying and the Development of Dairy Calves

Editor The Maritime Farmer:—

For the past year or so prices of all farm products have ruled so high that it matters little what we raise, we are assured a price never dreamed of in pre-war times. Growing anything eatable for man or beast will now pay handsomely if we can but grow sufficient quantities. This is the problem, the same old problem that Maritime Farmers have faced for years. Happy is the man who has been conserving and increasing his soil's fertility during the last few years, as he is now in a position to produce large crops to help supply the acute demand.

I am afraid the many years of low prices of food production below cost, has taught many of us to be confirmed grumblers, for despite the fact that we are receiving about 100 per cent. higher for our production than we received four or five years ago, we continually hear and read of men claiming that they cannot make any greater profits than when lower prices were the rule. The question of feed is always brought forward as a proof of this condition.

Now granted that feed and wages have risen in proportion to finished animal products, this would only apply to that which might be produced or grown from purchased supplies, but the products, whatever they may be, that are grown from the crops of our own farms, selling for about twice the pre-war value, must give us not twice the profit, (but, as the value is created from extra price alone), many times more profit than we formerly had to be content with. If we are growing as heavy crops as formerly, we are making more money from that which is our own labour at least. But, to be reasonably sure of paying crops from year to year, we must follow some line of live stock farming persistently despite the prices grain may bring. Fertile soil is like a well conditioned animal, it is able to resist adverse conditions whatever they may be. It is possible to get land in such condition that we are guaranteed a fair crop during an unfavorable season and a bumper crop in a good season.

Of all lines of live stock farming nothing is better suited to our condition than dairying and hog raising. If a man is so situated that he can afford it, and satisfied to make only an easy living or a mere existence by farming, then this branch will not appeal to him; but if a man is ambitious to increase his wealth, to pay off any indebtedness, or to make his farm double and treble its production, and be a property he can justly take pride in, nothing will be so suitable or sure as a line of co-operative dairy farming.

We might quote instances of the wonderful development of different countries such as Denmark, that all must admit, could not have increased her prosperity in any other known line of farming other than that followed by them. But Denmark's or even Ontario's particular condition may be unlike ours, and is not generally accepted as a safe one for Maritime farmers to follow, but we can find sufficient evidence of the benefits of dairy farming nearer home, and I will mention one:

The 'Island" is divided into fifteen electoral districts, twelve of these are districts of the towns and are solely agricultural, and are, or were at one time provided with cheese factories or creameries within reach of almost every farmer. A few of these factories have gone down and out, some others do not get sufficient patronage to pay properly, while others manufacture successfully for five or six months, and several creameries have been doing business continuously for over twenty years. The latter are principally confined to one electoral district, that is at present supplying nearly one-half the entire amount of milk furnished our dairy plants. This one-tenth of the Province is making nearly as much milk as the balance and with the result that the rate of taxation—which is a pretty fair way of valuing any country—is in this particular district about twice as high as the others. This is one of the best proofs of the benefits that co-operative dairying may be to any country.

Few men seem to realize the amount of value directly and indirectly a good working herd of dairy cows can be on any farm. In fact, where the year's production from the cows is calculated on many farms, sufficient credit is not given for the amount of milk and cream consumed on the place during the year. This amount on many farms, runs up to figures not often realized.

Where butter making is practiced, the value of sweet skim milk is seldom properly credited. Every experienced person knows that it is now very valuable as a stock food for the amount of nourishment it contains, and clear of its straight food value, milk for all young growing animals cannot be substituted.

It is not altogether how much an animal will grow on its ration of milk, as that it will often be a complete failure without it. Skim milk is good for everything, and the farmer who has any quantity of it all the year, will be

(Continued on page 240)

The Ford Saves the Hay and Oats the Horses Eat

IT HAS been estimated that five acres of land are required to maintain one horse for a year, and that the same five acres would produce nearly enough food for two people. If 50,000 Canadian farmers each replaced one horse with a Ford, 250,000 acres would be added to the Nation's source of food supply and enough extra food made available to feed 100,000 people.

Just think what a great service this means to the country at the present time and the benefit to the farmers from the sale of food produced on this acreage.

A Ford car also saves the farmer a week or more of valuable time each year, which can be used for further productive work. The Ford travels three times as fast as a horse and rig—costs less to run and keep, and is far easier to take care of. With labor so scarce and high priced, time means money, so do not delay in getting your Ford.

FARM LIGHTING SYSTEMS

Conditions change from year to year and what were considered luxuries a few years ago are now considered necessities. This is particularly true with reference to conditions on the farm. Things are no longer "all right because our fathers got along with them." The up-to-date farmer of the present time must have his home equipped with all modern conveniences not only because they add to the pleasure of living but also because they make him more efficient in his farm work.

One of the most important farm home conveniences is a good lighting system, a system which will do away with the dirty, ill-smelling kerosene lamp, which is a constant source of danger, is inconvenient, inefficient, and a care to the busy housewife.

Kerosene Lighting

Nearly all progress in lighting systems for the farm home has come about during the last half of the last century. Not many years ago our fathers were using the tallow candle and dip. The petroleum industry was not developed until 1860 and the general use of kerosene did not come until many years later. The kerosene or coaloil lamp was a great improvement over the method of lighting used by our forefathers. But it is used now in many homes that could well afford a better system. While kerosene lamps have objections, their merits should not be overlooked. The chief reasons for their common use are that the first cost is low, and fuel is cheap and easy to obtain. They are not dangerous when they are carefully handled, and they can be easily carried from one place to another—an advantage over most modern systems. Some of the objections to the kerosene lamp are: The odor is very unpleasant; it requires a great deal of attention; it develops a great deal of heat; it consumes a great deal of oxygen, making the air impure; the smoke from the lamp is a nuisance, settling on the furniture and furnishings of the house; it is not efficient when the amount of light produced is considered; the color of the light is not desirable.

Kerosene Mantle Lamp

A great step in advance of the old style flat wick burner is the kerosene lamp with a mantle. The first cost of such a lamp is more than that of the old style lamp but the addtiion of a mantle increases the efficiency many fold. Such a lamp gives a better light, requires less air than the old style lamp and gives off practically no odor. It has been found by experiment that a mantle lamp will give more than four times as much light as one of the ordinary tubular wick type where the same quantity of fuel is used. A mantle must be handled with care as it is fragile, and the wick must be trimmed right to give best results.

The farmer who is looking for a more improved lighting system than the mantle lamp has three systems from which to choose: acetylene, gasoline and electric. Each of these systems has certain advantages and disadvantages. Local conditions as well as desires on the part of the prospective would determine the system finally selected.

Acetylene Lighting

Acetylene is a gas produced from a commercial product called calcium carbide. Calcium carbide has been known for a number of years but it was not until the advent of the electric furnace that it could be made in quantities large enough for commercial use. This material is made of lime and charcoal and fused at a very high temperature. Calcium carbide in itself is not dangerous. However, it must be stored in water-tight and air-tight containers. If kept sealed from air and water it may be preserved for any length of time but when brought in contact with water a vigorous decomposition takes place and a gas, acetylene, is given off. Pure acetylene gas will not explode unless it is under pressure or until it is mixed with air.

There are a great many types of acetylene generators. The essential principles in all are the same, that is, the carbide and water must be brought together before the gas will be given off. The different plants might be placed in two classes, automatic and non-automatic, or the carbide-to-water feed and the water-to-carbide feed. The automatic type is the farm plant—it automatically takes care of itself after being properly charged. The non-automatic type is a large plant used in small town installation and requires an attendant to operate it. The carbide-to-water feed is the most common and most satisfactory; a great deal of water is available which insures cool generation.

Acetylene generators may be classed also as indoor plants and out-door plants. The out-door plant is the safer type. There are two kinds of out-door plants: the pit type and the above-ground type which is designed to resist cold weather. One of the advantages of the above-ground over the pit type is the fact that it can be cleaned out and recharged much more easily. The indoor generators may also be put in two classes: the large type which is put in the basement and the small semi-portable type which is sometimes put in the kitchen. The indoor plant is not recommended because of the greater risk and the fact that it must be recharged too often. The out-door plant of about 100 pounds capacity which does not require recharging oftener than once in three months is the best suited to the average farm.

Gasoline Lighting

Before gasoline will produce a suitable light it must be converted into a gas by one of three general methods. In the first method, the one that is probably most used and is the most dangerous, the gas is produced by heating. Examples of this method of producing gas are the gasoline stove, gasoline blow torch, iron, portable gasoline lamp and the systems where gasoline is piped through small tubes to the individual lamp. The gasoline in each of these appliances is under air pressure, produced by pumping, and is forced to the individual burners where the gas is generated. The flame heated generator, whether it has inside or outside tank, would come under this method of producing gas. The second method of producing gas from gasoline is by bubbling air through gasoline. In the generators of this type, air bubbles through a tank of gasoline and becomes nearly saturated. These generators are usually of the larger type and where located outside under ground are considered quite safe. The third general method of producing gasoline gas is by bringing air in contact with the surface of gasoline in a large tank. Nearly all gasoline plants which supply gas for laboratory or similar use are of this type. These machines are located outside and are safe. A carbureter is a part of a machine of this kind and it adjusts the air and gasoline to the right proportion. A high test, high priced gasoline must be used in a plant of this type. Comparatively few of such machines are used on farms.

Electric Lighting

While electricity has outstanding advantages for farm lighting there are certain disadvantages which would have to be considered by the farmer before he would wire his house for electric lights. The principal disadvantage is the fact that the farmer does not always secure a suitable source of electricity to produce his lights. There are two sources available for this purpose. The first is the small storage battery plant operated automatically or non-automatically by a gasoline engine. A great many of them are giving first class service. The second source of electrical energy is from high voltage lines which run by a farm in going from one town to another or from lines extended out into farm districts for the use of the farmers only. This is the best source of power for the farmer if obtained from a good company, at a reasonable rate.

There are four essential parts of the small electric plant; namely, a source of power, a generator, a storage battery, and a switch-board. Some form of gasoline or kerosene engine is usually used as a source of power. In some sections a water mill is available. A few wind-mills have also been used successfully.

The function of the engine, water wheel or windmill is to transform the stored up energy of the fuel or the energy of the wind or water to a form of mechanical energy suitable to drive the generator. The function of the generator is simply to transform the mechanical energy into electrical energy. The generator used is one of the direct current type so that the power can be stored in the battery. The voltage of the generator is either a standard 110 volt or 32 volt which is commonly called the low voltage plant. By using a low voltage generator the cost of the storage battery is materially reduced. The only reason a low voltage plant is not advisable in all cases is because it is not feasible to transmit low voltage electricity to a very great distance without a great loss or it would necessitate a very large conducting wire. This is comparable to water under high and low pressure—if it is under low pressuse, larger pipes are required to carry an amount of water equal to that carried through small pipes from the high pressure pumps. When buildings are several hundred feet apart high voltage plants are advisable.

The function of the storage battery is to act as a storeroom for the electrical energy and corresponds to the water tank in a water supply system. If water is not being pumped the water is used from the storage tank; if the pumps are in operation and the water is not being used as fast as pumped part of it will go into the tank and part will go out into the pipes. This is equally true of the electric plant. The storage battery acts as a tank or reservoir.

The switchboard with the switches and instruments which are mounted on it is a door to the storeroom or storage battery. The instruments make it possible to see at a glance the condition of the battery. With the switches, the lights can be turned on or off when desired. The protective devices simply protect the battery and generator when there is an unusual rush of current.

While all of the different makes of electric plants are the same in principle there are plants on the market that operate automatically, others that operate partly automatically, and still others that are manually operated. There are plants in which the generator, engine and switchboard are all in one unit while others have the engine connected to the generator by belt. One thing about the latter type of plant which appeals to a great many men who own engines is that they can drive the generator at the same time the engine is being used for some other purpose. With a uniform speed engine belted to a line shaft this arrangement would no doubt be a good one, and would save the cost of a new engine.

The following table shows the relative cost of various kinds of light. The cost is for one 40 candle power lamp burning 1000 hours, which is equivalent to two 40 candle power lamps burning three hours each night for nearly six months, or about eight or nine ordinary batwick coaloil lamps burning during the same period.

Readers will notice that these prices are based upon quotations at American poists. In most parts of Western Canada these prices would be considerably higher.

Kind of Lamp	Cost
Gasoline with gas mantle, gasoline at 20c gallon	$0.49
Electric arc lights, 10c kilowatt hour	2.82
Kerosene lamp with mantle, kerosene at 12c gallon	2.88
Artificial gas with mantle, gas at $1 per thousand feet	3.20
Blaugas, 10c per pound	3.33
Electric tungsten lamp, 10c kilowatt hour	5.00
Acetylene light, carbide at 4c per pound	6.68
Artificial gas, open bame at $1 per thousand feet	8.33
Kerosene lamp, bat wick, kerosene at 12c per gallon	13.75

The first cost of a complete installation of different lighting systems for farm homes is about as follows:

1. Acetylene $150.00 to $500.00.
2. Gasoline $25 to $500.
3. Blaugas $125 to $300.
4. Electric $250 to $600.

A modern lighting system should not be selected on the basis of economy. It costs money to be comfortable and happy, and a throughly efficient lighting system will bring many joys into the home. One man who owns a modern lighting system says he would not recommend it to his neighbors because it costs more than kerosene. Another says it takes too much time to keep it operating. Such statements are ridiculous. People might just as well get along without kerosene and live as men of one hundred years ago—it would probably be cheaper. The man who claims it takes too much time to operate a modern lighting system does not realize how much time is spent by his wife in caring for the coaloil lamps.

To neglect providing a suitable lighting system for the home is often a great mistake. The man who will not spend money for this purpose will likely have to spend more in correcting his children's eyes. Short-sightedness in school children is a very common defect which increases with age. It is due principally to poor school room lighting and to poor lights in the home. When a child reads by a poor light there is a tendency to hold the book near the eyes and near-sightedness is the result.

When so much money is being spent for all kinds of farm machinery, better livestock, good seed and other improvements, conditions in the home should not be forgotten. Every farmer should put in a good lighting system along with the other modern conveniences for the welfare and happiness of the whole family.—E. W. Lehmann, Missouri Agricultural College.

HOW TO USE FROZEN POTATOES

"Frozen potatoes are not necessarily spoiled," writes M. deRosinor in a French agricultural paper. Although not very palatable in this condition, they may be dried and then cooked as usual. As frozen potatoes decay rapidly when thawed out they must be evaporated as soon as possible and can be dried in the oven of an ordinary cook stove. Heat the oven to baking temperature put in the potatoes and leave the door open. Spread them out in a layer and stir them up with a poker from time to time, to faciltate and hasten the drying process. When the drying is gone far enough the potatoes will be hard like pieces of wood, in which condition they will keep indefinitely.

Dried frozen potatoes are most suitable for stock feeding. In preparing them for use, boil them with enough water to bring them to the consistency of mashed potatoes. It will be found that they have lost none of the elements that gave them their nutritive value, alhough, of cuorse, they will not be as palatable, nor taste the same as potatoes which have not been frozen.

The best width of wagon tires has been found to be: one horse wagon, 2 inches; light two hores wagon, 2½ inches; medium 2 horse wagon, 3 in.; standard 2 horse wagon, 4 inches; and heavy 2 horse wagon, 5 inches. These figures were secured in extensive tests on earth and macadam roads by the U. S. Department or Agriculture.

HORTICULTURE

APHIDES

Aphides are tiny, soft-bodied, usually sluggish insects. There are a great many species, and so common are they that most of our plants are attacked by at least one species and sometimes by several.

The different species often differ greatly in color; some are green, others black, others red, others brown, and so on. They all obtain their food by sucking the juices out of the plants after first penetrating the epidermis with their sharp needle-like lances. As they feed they exude from time to time a clear, sweetish liquid called honey-dew, of which ants are very fond.

When the aphides are very abundant, such a large quantity of honey-dew is exuded that it covers the leaves and fruit and causes them to become sticky and later a dirty sooty color, due to a black fungus which grows in the honey-dew. There are many generations each year, some species having thirteen or even more. Each generation, except the last, consists entirely of females. The last is composed of true sexual forms, males and females. These mate and the females lay eggs for winter and then living young instead of eggs are prodie.

In all the preceding generations duced, and that too without the presence of any males. The first generation in the spring is composed entirely of wingless forms, but in the later generations winged forms appear. These can by from tree to tree and so distribute the species. Some, but not all, species have what is known as an alternate host plant or plants; that is they remain from one or more generations in the spring on the plant on which they over-wintered and then a winged generation appears which migrates to some other kind of plant and lives and reproduces on this until autumn, when another winged generation is produced, which migrates back to the original host.

The rate at which aphides can multiply is marvellous and far surpasses that of any other common orchard pest. This is due to the fact that there are so many broods each year, and that each brood except the last is entirely composed of females. Very fortunately for us, these insects have many enemies which do a great service in helping to control them. The chief of these are Ladybird beetles and their larvae, Syrphus Fly and Lacewing larvae and tiny four-winged parasites. In addition to these, disease often destroys countless numbers and weather has also a great influence. Cool, moist weather seems to be favorable an hot, fine weather unfavorable to orchard aphides.

FERTILITY OF RASPBERRY SOILS

The use of fertilizers in raspberry plantations is governed by the same principles that appl yto their use with other fruits. As soils vary in the quantity and availability of the plant food they contain, the fertilizer problem is a long one, which each grower must solve for himself. By using varying amounts of the different elements of plant food on different plants and keeping a record of the yields, each grower can determine readily what kinds and quantities of fertilizer to apply.

Good management, however, will insure a large amount of humus in the soil at all times. It is especially desirable that the humus supply be ample when the plantation is first set out. It is much easier and cheaper to furnish the humus by means of cover crops and stable manure before the plantation is set than afterwards when the plants are growing. Moreover, by such extra care before setting, it is possible to secure a fair crop of fruit the second season. Because it costs so much to care for a plantation for a year, it will pay well to have the soil in a high state of fertility before the plants are set, so that the plantation may be brought into bearing a year sooner than would be possible otherwise.

In many sections no fertilizers are used on bearing plantations. In the older raspberry sections, however, some commercial fertilizer and stable manure are used, and it is considered profitable to use them. Stable manure, however, usually has given the best results and experiments have shown that, where obtainable, it furnishes the best means of enriching the soils on which the experiments have been tried. Stable manure not only furnishes some plant food but supplies large quantities of humus. If an annual application of about 10 tons per acre is made, the humus supply should be maintained, and with proper treatment in other ways, the field should be kept at a high state of productiveness. Some soils and some sections will need a larger quantity and some less than 10 tons per acre. A heavier application, however, should not be made unless it has been found by actual trial to be desirable, as it is possible to stimulate the growth of canes and leaves to such an extent as to reduce productiveness.

Cover crops may be used to maintain the humus supply. Oats seeded at the rate of 3 bushels per acre in late summer should give a dense stand of material to turn under before winter, or they may be left to serve as a covering during winter and plowed under in the spring. Cowpeas, veach, the various clovers, and other crops also may be used in the raspberry plantation. Care must be taken in growing the vetch and clovers, as they live through the winter and it may prove costly to eradicate them. However, if they are drilled in between the rows and turned under before they become too rank in the spring, little trouble should be erperienced.

QUALITY IN CELERY

The following from the Vermont Agricultural Experiment Station regarding quality in Celery is valuable:

Quality in celery is primarily a question of the proportional relationships of the so-called parenchymous tissue to the fibrous tissue; and this is determined in part by varietal differences and, within varietal limits, in the main by certain external conditions, such as soil moisture, plant food, rate of growth, light, warmth, pest control and blanching.

Celery contains 93 per cent. or more of water and its cells must be turgid if a crisp product is to be secured. A series of experimental trials wherein plants were grown in water or were given water in amounts ranging downward from 187 cc. to one cc. daily, resulted in no height growth, or, indeed, in shrinkage in height when 15 cc. or less were supplied daily, and increasing height growth when 31 to 187 cc. were used. Being a foliaceous plant, celery responds more readily to soil dressings of nitrogen than to other forms of plant food.

The character and the quantity of parenchymous tissue is determined by the growth rate, which, in turn, is governed largely by moisture and plant food opportunities. Slow or checked growths cause stringiness, and overrapid growth, an excessively elongated and stringy growth.

Light is an imprtant factor. Several plants were grown either in full light, in half ight or in darkness. Intense light hindered growth and lack of light caused an abnormal etiolated growth. The full-lighted crop was dwarfed, stringy and tough, the half-lighted crop was of good quality, and the no-light crop was long stemmed, watery and subject to disease attack.

Celery grows best in a cool temperature. In a series of trials a crop grown at approximately 89 degrees F., was shorter and far more leafy than one grown at 60 degrees F., but its quality was not injuriously affected.

Blanching, if properly done, tends to develop a "nutty" flavor; if improperly done, a bitter flavor. In either case, the chlorophyll is profoundly modified, or, indeed, destroyed.

"Pithiness" is characterized by lack of parenchyma. It has been shown at the Maryland station that this is due in the self-blanching varieties to heredity, to the propagation of an undesirable strain or to reversion, but that, in other forms, it is quite as likely to be due to unfavorable cultural conditions. Careful seed selection should to a large degree obviate this difficulty.—H. B. Norton.

Proper Feeding Pays

Yes—and handsomely, too. Here's what Mr. H. W. Corbett, of Annapolis, N.S., has to say about it: "I have a flock of Plymouth Rock pullets. I put five in a separate house and gave them

Pratts POULTRY REGULATOR

In February the five pullets produced 116 eggs, or 23 to 24 each. The other 30, without having Pratts, produced only 15 to 16 eggs each. I then fed the 30 Pratt's Poultry Regulator, and in 10 days my hens increased 50 per cent. in laying."

Could you ask for better proof than this?

Order Pratts to-day from your dealer. He has it in popular-priced pkgs., also in money-saving 25-lb. pails and 100-lb. bags.

Money Back if not Satisfied

Pratts Poultry Disinfectant

Is a most economical and effective lice and mite killer and germicide for spraying roosts, nests and poultry houses. 1 gal., ½ gal. and 1 qt. cans at your dealer's.

RED SPIDER

Practically all vegetables are subject to attack by the red spider. It is not a true spider but a mite, the latter name being indicative of its minute size. It is well distributed throughout the country.

Among vegetables and truck crops most attacked are beans of all kinds, cowpeas, eggplant, cucumbers, tomatoes, melons, squashes, strawberries, raspberries, beets and celery. It is also a greenhouse pest and does great damage to cucumbers and tomatoes, as well as to ornamental plants grown under glass.

It is a general feeder in the broadest sense, infesting the foliage of shade and fruit trees and some field crops. It is often present on the under surface of leaves like beans without being suspected. This mite injures plants by sucking the juices, and when plants are neglected their vitality is slowly reduced by loss of sap, and in time all of the plant's functions are deranged. In case of severe attack, millions of red spiders can be found on the foliage, and the webs which the insect spins from plant to plant can be easily seen, with the mites themselves passing rapidly over them and congregating in swarms. Sometimes the plants look as though stricken by fire.

The remedies are spraying with soap solutions, kerosene-soap emulsion, and sulphur preparations. Flowers of sulphur mixed with water at the rate of 1 ounce to 1 gallon sprayed over infested plants is of great benefit. Unless remedial measures are adopted early and applied as often as necessity demands, red spiders are almost certain to do great harm to delicate plants, since if the plants become thoroughly infested they seldom survive. Frequent spraying with soap and water will often keep the pests in check, especially in greenhouses.

ABOUT BEANS

Beans are more susceptible to cold than peas, and should not be planted until danger of frost is past and the ground begins to warm up. They are however, among the most desirable vegetables that the home gardener can raise. There are many different kinds and varieties of beans, but for garden purposes they may be divided into two classes, string and lima. Both classes adapt themselves to a wide diversity of soils and climate. They grow rapidly, and, therefore, leave the area in which they have been planted free for another crop. To secure a continuous supply it is desirable to make plantings at intervals of 10 days or two weeks from the time that the ground is reasnoably warm, until hot weather sets in.

Both string and lima beans are subdivided into pole and bush types. The pole lima bean shouuld be planted with from eight to 10 seeds in the hill, and after the plants become established, should be thinned to thiee or four. The hills should be four or five feet aprat. Bush lima beans are planted five or six inches apart in rows 30 to 36 inches apart. Bush beans of the string type may be planted somewhat closer—the plants standing three or four inches apart in rows from 20 to 24 inches apart, if hand cultivation only is to be employed.

Beans of any kind should not be planted any deeper than is necesary to secure good germination. This should never be over two inches, and on heavy soil it should ont be as deep.

BEE-KEEPING IN RELATION TO HORTICULTURE

An authority has made the statement "Nature abhors self-pollentation." When plants are cross fertilized the offspring are larger in size, grow more vigorously, bloom a little

Nitrate of Soda

Data as to increased crop yields due to the use of Nitrate are available. Why not make your business of crop fertilizing profitable by the use of Nitrate of Soda whose efficiency is known?

A bushel of corn or wheat or a bale of cotton today will buy more Nitrate and more Acid Phosphate than ever before.

WEAK, AILING BABY.

No food agreed, and fast Wasting Away. But soon cured by Dr. Cassell's Tablets.

Mrs. Jarvis, Box 286, Penetang P.O., Ont., says:—"When only five months old my baby fell ill, and in spite of medical treatment wasted away till he seemed just skin and bone. I tried special foods, but none of them would stay on his stomach, and we never thought we should rear him. But one day I read about Dr. Cassell's Tablets, and got some for baby, and I am thankful I did, for they quite cured him. He is a bonny boy now."

A free sample of Dr. Cassell's Tablets will be sent to you on receipt of 5 cents for mailing and packing. Address Harold F. Ritchie and Co., Ltd., 10, M'Caul-street, Toronto.

Dr. Cassell's Tablets are the supreme remedy for Dyspepsia, Kidney Troubles, Sleeplessness, Anaemia, Nervous ailments, and Nerve paralysis, and for weakness in children. Specially valuable for nursing mothers and during the critical periods of life. Price 50 cents per tube, six tubes for the price of five, from Druggists and Storekeepers throughout Canada. Don't' waste your money on imitations; get the genuine Dr. Cassell's Tablets.

earlier, and yield seed more abundantly.

Plants must spend their lives where they are developed from seed. They may not roam about like animals to seek their mates. Thus we have a partnership between bees and plants, between horticulture and apiculture, as decreed by Mother Nature.

This is seen by studying the shape of many of our common flowers. If we were able to ask a flower the puestion: Where is your nectar? Where is your pollen? And what is the path the bee must follow to get to the nectar? The answer would decide us as to the value of bees to our gardeners and fruit growers.

The bee is covered with thousands of small hairs. When it is gathering the nectar many of the little pollen grains adhere to these hairs and are carried to the next flower visited, where the pollen dust is often left on hte stigma of the plant. Thus the bee brings about the cross fertilization so necessary with many of our plants.

Another fact that strengthens the relationship is that when a bee commences to take her load of nectar from a certain variety of plant, say white Dutch clover, she will complete her load from this plant, often going by a large thistle or other plant well filled with nectar. This seems to be a provision of nature to prevent the hybridizatioo of plants of different varieties.

The up-to-date horticulturist or gardener makes sure that there will be bees in the vicinity, not because he is interested in the production of honey, but because he knows that without bees he can not rgow so much fruit. If any of you have any doubt on this point let him enclose a limb of a plum or cherry in a bag of mosquito netting just when the branch comes into bloom. If his experience is the same as it has been with others who have tried it, he will find that on the covered branches which thebees cannot get at, the blossoms will not yield over five per cent. of fruit. The branches that are free to the visit of bees and other insects, other things being equal, will yield their full amount of fruit.

GROWING PEAS COMMERCIALLY

The two drawbacks to growing garden peas are picking them and finding the proper variety to plant. Where any quantity is lpanted they are best given out for picking by the basket, and then the picker will hustle and not loaf on the job, for it is tedious work. If you do not want to put on extra labor, three can pick the crop every ten days or two weeks ,that one bushel will sow, and keep up with the other work, if the plantings do not last over six weeks.

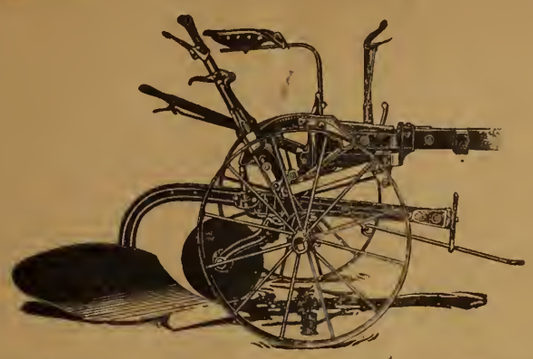
To pick right the vines must be mature and pulled up for the first and last picking. If handled twice and the pickers have to crawl amongst the vines poor headway is made. The variety we plant and recommend after many trials and kinds is Thomas Laxton. It is very productive, not subject to mildew, withstands the ravages of the pea lice, and is large podded, therefore fills the basket puickly.

Picking is done in ⅝ bushel baskets. The past season good peas brought not less than 90 cents wholesale, and up to $1.50. These are considered fine prices.

We plant peas so as to hand weed them, which takes two hoeings with a double-whel hoe. The rows are drilled with the marker set for "peas" 14 inches apart. This variety grows about 30 inches high, and with this distance apart they support each other. Plantings are made 10 to 14 days apart.

When about six inches high they are wheel cultivated with the cultivator knives. The second cultivating is done just as they are ready to topple over, and the small plows are used to pull the dirt to the peas on each side. This is all that is necessary even in the weediest ground.

The best peas we raise are grown on ground that is manured from poultry houses and litter from the floors. You can see the difference when planted side by side, using chicken manure for one and stable manure for the other . They fill up nicer, taste better and are more prolific grown on the poultry manure.—C. Van Horne.



HAMILTON PLOWS
FOR LONG HARD SERVICE

It takes a real plow to make good with the plowing experts of Eastern Canada. Therefore, we take pride in the fact that the Hamilton No. 126 sulky meets with their approval.

It is adjustable to all conditions. It is easy to operate. It is built to do first-class plowing for many years. Note the handy pole shift. With it you can instantly change the landing of the beam, straighten crooked furrows, adapt the plow to side hill plowing and to the turning of short corners.

The Hamilton 126 is a two-wheel sulky with a horse lift—a simple type that is remarkably easy to operate. The horses do practically all the work, yet the draft of the plow is so light that they do a full day's work with it.

The Hamilton line also includes tractor plows, walking gangs, two-way plows, and a choice assortment of walking plows. All are made with the thoroughness you will find in the 126 sulky. Note the new spring beams and long handles of the walking plows. Write us for Hamilton plow folders.

BEST SPRAY FOR SCALE PESTS

I have been a constant user of lime-sulphur from the time it came into use, both as a dormant and as a sumner spray. Two years ago I changed and began to use scalecide as a dormant spray, which, of course, is the only thing the manufacturers recommend it for. After a thorough trial under varying conditions I find it will do all lime-sulphur will accomplish, also do what lime-sulphur will fail to accomplish. My orchard was full of canker, but with this spray I have practically cleaned it out the past two years.

All New England orchards are infested with this pest more or less and the recommended method of combating it is to cut out the canker. Woolly aphis is another troublesome pest, also green apple aphis, causing serious injury to young trees. I have seen nothing of these pests to speak of the past two years. This spray seems to inject new life into a tree, especially young ones. My young orchard of 500 trees I am bringing up on the spray. They say it will kill trees, but if that is the way it does it, by growing them the way my orchard is growing, I only wish I had used it 10 years ago.

When I used lime-sulphur for dormant spray it took from 13 to 14 barrels to go over my large orchards. It only requires four barrels scalecide. The wonder to me is that more fruit growers do not use it. I suppose they have been told at some time by a lime-sulphur agent that it would kill the trees. If given a trial, I am confient it will prove its superiority over lime-sulphur. Even if it did not more than lime-sulphur, the pleasure and satisfaction of handling it as compared with the sulphur compound would be in its favor.

Of course, we must have lime-sulphur or sulphur compounds for summer operation. I have made a thorough trial before recommending scalecide. If there is anything better than I am using I want it. The best is none too good for me. I have too much at stake not to have the best.—C. T. Holman.

WATER-CORING OF APPLES

Water-coring is most frequently found in Baldwin, Northwest Greening and Gravenstein. Leaving the fruit on the trees too late, thus allowing them to become overripe, causes water-coring. It is believed that this is due to cool weather checking the respiration from the leaves, while the roots continue to absorb a large amount of moisture. The fruit in consequence becomes overloaded with moisture.

Storage of apples in this condition has been found to entirely eliminate the water-coring. Water-cored apples after three months storage were discovered to be quite normal and possessed good keeping qualities.

Farming is a money-making business. When studied as other great enterprises are, and placed on a scientific basis, it will become the safest and most remunerative of all occupations.

The farmer owes no higher duty to the boys and girls, and to society in general, than to place at their command literature discussing farm topics.

DAIRYING.

ANOTHER WORLD'S RECORD FOR CANADA

The Holstein-Friesian cow, Zarilda Clothilde 3rd DeKol, owned by Colony Farm, Essondale, British Columbia, has just completed an official test for one year that entitles her to rank as a world's champian milker. This cow was under the constant supervision for the whole year of a representative of the Provincial Department of Agriculture, who watched, weighed and tested every milking. Her production was 30467.3 pounds of milk and 1071.-34 pounds of butter. This milk record is the largest ever made by any cow in the world under official test. The former champion was Forward Somerset Duchess with 28540.1 pounds of milk.

Holsteins Win the Dairy Tests

At the recent Ontario Provincial Winter Fair the championship prize in the dairy test, seventy-four cows of all breeds competing, was won by a purebred (but unregistered) Holstein cow owned by Earl Grier, Woodstock, Ontario. This cow produced in three days 219.1 pounds of milk testing 4.3 per cent. fat. Mr. Grier also exhibited two other grade cows giving nearly as much milk, one of which averaged 4.6 per cent. and the other 3.9 per cent. Anyone who saw these cows could not help but be convinced of the great value of a good Holstein bull at the head of a working dairy herd.

At the dairy tests held in connection with the Fall Fairs in various parts of Canada the Holsteins again made nearly a clean sweep, winning first place at Calgary, Alta., Lloydminster, Sask., Renfrew, Ont., St. Scholastique, Que., Stratford, Ont., Sherbrooke, Que., Quebec, Que., Charlottetown, P. E. I., and Duncan, B. C.

Record Prices for Holsteins in Great Britain

Among dairy cattle breeders and dairymen farmers in Great Britain, the present chief topic of conversation, apart from the war, is the wonderful prices being realized at public sales for the black-and-white dairy cattle. Commencing in July, there have been a number of prominent herds either dispersed or reduced, mainly owing to shortage of labor; in one case, three sons, who together with their mother had succeeded in building up a great show and producing herd, all having answered the colors. Some of the outstanding features of these sales were: the strong demand for the best, the even distribution of the cattle, which were scattered from the extreme north to the south of England and parts of Ireland; the number of new adherents to the breed, whose names figure in the list of purchasers; and the increased attendance of women around the ringside, who, in many cases, were among the top buyers.

On July 24th, fifty-two head owned by John Bromet, a breeder of high repute at Tadcaster, Yorkshire, were sold for an average of $1.150 per head; top price of $8.500 being paid for the bull, Botermijn, bought by Mr. Bromet in 1914 for $2,550. Mrs. Putnam, a lady enthusiast, paid top price for females at this sale, securing Garton Fullpail, a show cow and a splendid producer, for $3.000.

The next important sale took place on August 7th, when the herd owned by Major D. A. Spence, Kincardineshire, Scotland, was dispersed, 77 head bringing an average of $310, 16 cows averaging $340 each. August 18 saw the reduction sale by A. Munro at Dell of Inshes, Inverness, when 43 females averaged over $940 per head, $4,000 being paid for the bull Hollander, (the purchaser receiving an offer of over $5,000 for his bargain;) $5.000 for a four-months old son of Hollander; $4,100 for the cow, Dell Eeke 3rd, and a number of other young females going for well over $1,000 each.

The upward trend in prices for good specimens of the black-and-white breed continued and on September 28 the Duchess of Hamilton's Rochford herd was dispersed at Easton, Wickham Market, Oxford. At this sale five bulls sold at an average price of over $1,300 each; 74 cows and sheifers averaging $950. The bull, Johan, was sold for 3,900 and for possession of the cow, Joukje, the bids waxed fast and furious until she was knocked down at $8.250. This animal was described as a magnificent, typical, well-bodied, heavy-milking young cow, with depth and vessel, her milk record for 295 days, with first calf, being 996 gallons. A month-old daughter of Joukje brought $5,250 and a yearling daughter (full sister to the first) was also sold for $5.250. The imported bull and heifer (Johan and Joukje) cost the Duchess of Hamilton, in 1914, $1,425. They and their produce realized in the sale $23,400.

During the month of October, further evidence of the demand for Holsteins was forthcoming at the sale of surplus stock held by A. and J. Brown, owners of the noted Hedges Farm herd at St. Albans, near London. Fifty-nine head were sold at an average price of over $1.200 per head, four bulls averaging around $4,750 each. The top price was $12.500 for the yearling bull, Hedges Second Series, his sire being also sold for $5.000. Seven cows and heifers were sold at prices ranging from $1,000 to $1.500 each.

Commenting editorially on the tremendous interest that has arisen in Great Britain in connection with the Holstein breed, the Live Stock Journal of London said in a recent issue: "There seems to be no limit to the prosperity of the Holstein-Friesian, for, after beating all records for any dairy or dual-purpose cattle sales in this country by the averages received at Mr. Bromet's sale at Tadcaster, Mr. Munro's herd at Dell of Inshes, Inverness, showed an average of £172 1s 4d (over $850 per head.) The progress made by the black-and-white breed is phenomenal to the partisans of the breed, who openly boast there has been nothing quite like it in the whole history of pedigree stock breeding. Who, they ask, six years ago would have imagined that the Holstein-Friesian would beat the dairy Shorthorn in the matter of herd averages at sales? Who, they also ask, would have dreamed that the number of breeders would be multiplied by twelve, and who would have thought it possible for a calf of this breed to realize 1.000 guineas at public auction? Yet all these things have actually happened, and it is asserted that had a certain telegram been delivered before the close of the proceedings at Dell of Inshes, the average for the whole sale would have been higher." This was written before the sale of the Hedges Farm surplus stock, when an average of over $1.200 was reached with a top price of $12.500 for a yearling bull.

FARMERS SHOULD TEST THEIR HERDS FOR TUBERCULOSIS

The opinion seems to be growing amongst consumers of animal products that disease, in these farm commodities, is becoming more prevalent today than in former times and that there is real danger in their use.

In earlier days, when cattle were kept under different conditions and there were no restrictions and none of the modern means of testing animals that we have today, very little notice was taken of these things. If a cow or steer was taken sick and died, they were buried and forgotten in a few hours. Today, one wants to know the cause; investigations are instituted, post-mortem examinations are made, and the whole proceeding is common talk of the public street, the club, and the newspaper. On this account, whether disease is really proportionately greater or not, it is much more commonly talked of and feared.

Since it is now known that there are some insidious diseases in our midst, which are more or less dangerous to the health of the community, it should be the aim of every stockman to be on the lookout for any signs of -I Iy.nnmnthooooooooo shrd etain shrdl these conditions and to so protect themselves that they will be able to eliminate it before it has gotten a strong hold in the herd.

Of all the diseases that are to be most feared and dreaded in this country, at the present time, none is so much in the public mind as that of tuberculosis. The apparently unfortunate thing about this disease is the fact that a herd may be badly infected with it and yet show no symptoms that would lead one to suspect its presence. Fortunately, however, a test has been discovered whereby one may locate the disease if it is present in a herd without the need of slaughtering the animal. This is known as the tuberculin test. It is not expensive and can be applied by any intelligent and careful stockman.

As matters stand today with reference to this dreaded disease it looks as though farmers and particularly breeders of pure bred cattle, were missing an opportunity to rid themselves of this scourge by not applying this test regularly and systematically to their herds. This is not being done, at least, to any great extent. True, there is here and there one who is profiting by this opportunity but they are greatly in the minority.

A leading stockman came into the office of the Maritime Farmer recently and in the course of a conversation stated that he had not banked any money for some time, but had used all his available cash to build up his herd, and in further discussion admitted that he had done no testing. Now, it is quite possible that this breeder's herd is absolutely free from tubercular infection, but on the other hand it may also be possible that many individuals of the herd have tuberculosis, even in an advanced stage. If this herd were to be inspected now and found to be badly infected with the disease, think of the great loss it woul be to him, after having spent practically all his savings for several years in developing this herd. In many cases the result would be so serious that the owner would be crippled for the rest of his natural life.

Now the thought that we want to impress upon the minds of our readers is the fact that there is no good reason why any man should be caught in that position. Now that the tuberculin test is comparatively cheap, easily applied and considered reliable, no man should think of building up a herd without knowing exactly where he stands in this matter.

In starting a herd one should refuse to purchase anything but a tested animal, and by this we mean not an animal tested years before, nor even a year before, but right at the time of purchase, for the simple reason that a cow may be free from the disease to-day, and in a year from now be badly infected. Not only should one start right by purchasing tested animals, but in order to be sure of his ground, he should apply the test to every animal on the farm and clean up anything likely to cause trouble. This having been done, the breeder's next duty should be to test his herd once or twice a year so that no advanced stage of the disease could ever be reached, before he would be apprised of the fact, and be on the job at once to overcome it. Any animal that reacted could then be turned off for beef before the disease had progressed far enough to render the meat unfit for use.

By following out some such system as this one could protect himself against this insidious enemy and preserve his herd in a state free from serious invasion; and not only so, but by this process of elimination, all animals more or less pre-disposed to the tubercular germ would sooner or later be expelled from the herd and a lot stronger and better able to resist its ravages be gradually secured.

There is no doubt but that the indiscriminate buying and selling of animals, both in the sale ring and on the farm without being tested to determine the state of health that an animal is in at the time of the transaction, is the greatest contributing factor of anything toward the spread of tuberculosis.

Now that this question has been before the public for so long, and has been discussed from all angles, it is up to the farmers to adopt some radical measures to protect themselves from the scourge of the dairy and other herds of the farm.

There was a time when the farming community did not know the disease, or realize the dangerous character of it; but this fact cannot be offered as an excuse today by any intelligent agriculturist, and to ignore the fact of its presence and thus invite disaster in the herd is surely not only a most unbusinesslike proposition but a practice altogether inconsistent with moral principle and business etiquette.

The time has come when every dairyman should make a determined effort to stamp out this disease germ from his herd. It is no good for any man to disclaim responsibility in this matter by saying that individual effort is useless, so long as the great majority are indifferent to the cause. Reforms are never brought about by majorities. It is by the individual, here and there, taking higher ground; and by continued and successful effort forcing others to do the same or to pack up their grip and move on to other velds of enterprise.

Individual effort will at least lift one's own herd out of the quagmire and put it upon the solid rock of permanent improvement and worthy ambition and at the same time it cannot fail to influence some other fellow to step out in the right direction and reap the benefits of the more progressive and practical pioneers of a noble cause.—O. V. J.

BUTTER NOT COMING

We are having trouble with our cream We cannot get butter. It is sour and thick when we churn at from 60 to65 degrees. There seems to be butter on the top, but it only frothhs. By letting it stand cold, it hardens into chunks like butter. Then if taken off and put into cold water and churned it will melt away.

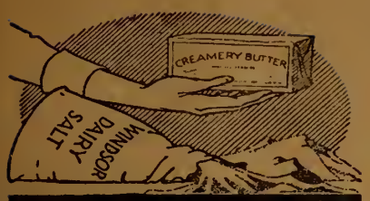
Leeds. Co.

Difficulty in shurning is usually due to one or more of the following causes:

1. The cream may be too cold, too thin, or too thick.
2. The churn may have too much cream in it.
3. The cream may have been kept too long.
4. A farrow (or stripper) cow's milk may be causing the trouble.
5. The feed may be too dry.

The above rules are given by Prof. Dean of the O. A. C. Guelph. You may discover in them some reason why your butter does not come.

We think your cream is too thin, that you are churning at too low a temperature, and that it may have been kept too long. We advise trying it at 70 degrees, and if it does not come in a reasonable time let it stand until the froth gathers on the top; then draw off the buttermilk and churn again without adding any water and you will surely get the butter to gather unless the trouble is from cows too far on towards freshening or is of bacterial origin—the cream standing too long, etc.



Adds Quality to Every Pound of Butter

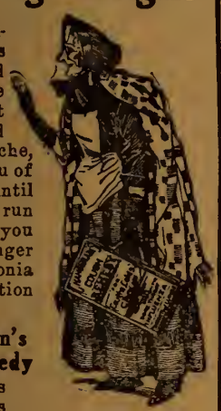
Hacking Coughs



For hacking coughs—the kind that make your throat sore and your head ache, that rob you of your sleep until you are so run down that you are in danger of pneumonia or consumption—take

Chamberlain's Cough Remedy

It soothes and heals the inflamed air passages, stops the tickling in the throat, and by its tonic effects helps you to throw off the disease.

Chamberlain's is quite different from the ordinary cough medicine, for it not only soothes but also heals, restores the affected parts to a healthy condition. I believe it is the best and most reliable preparation ever produced for coughs and colds.

Yours for Health.
—Granny Chamberlain.

W. F. STEPHEN, Secretary
Canadian Ayrshire Breeders' Association
Box 504 Huntington, Que.

Minard's Liniment Co., Limited.

Gentlemen,—Theodore Dorais, a customer of mine, was completely cured of rheumatism after five years of suffering, by the judicious use of MINARD'S LINIMENT.

The above facts can be verified by writing to him, to the Parish Priest or any of his neighbors.

A. COTE, Merchant.

St. Isidore, Que., 12 May, '98.

FOOD VALUE OF SKIMMED MILK

As a contribution to the high cost of living discussion, Professor James O. Jordan, head of the Boston health department, offers the suggestion that more skimmed milk should be used. He has issued this statement:

"At this time, when the high cost of food materials must be seriously considered by householders, the employment of skimmed milk affords a means of appreciably reducing living expenses. This product may be obtained at nearly half the price of whole milk, and may be used in the place of the latter as an addition to food materials with great advantage where price must be taken into account.

"Skimmed milk is a useful and economical food, but its value is not generally recognized. It should be used more extensively in place of whole milk in many culinary operations. For this purpose it cannot be too highly recommended. By its general employment human beings would need less of higher priced foodstuffs for their nourishment than is necessary where skimmed milk forms no part of the diet.

"Skimmed milk furnishes protein at about half the outlay for which this essential can be purchased as milk; it is also a valuable source of carbohydrates and mineral water. The deficiency of fat in skimmed milk is counterbalanced by the fat of the ordinary mixed diet.

"The general use of skimmed milk for cooking purposes in place of whole milk would have a further advantage than the immediate reduction of the size of the family milk and food bills. It would tend to relieve the present shortage in the milk supply, and, as les whole milk would be required by the community, a condition would be created which would hasten the lowering of the price of butter, cheese and other milk products. It is not advisable, however, to give skimmed milk to children under five years of age, as they should be given whole milk of the best quality."

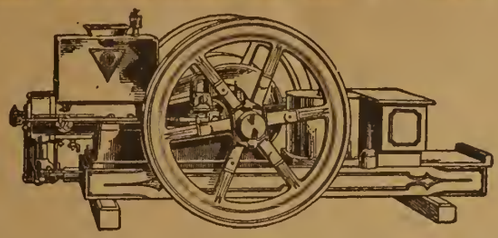
"TOO MUCH BOTHER"

Cy says there's one thing about it—he's just going to quit keepnig Holsteins. Says the pesky things get up at the most outlandish hours—middle of the night about, to be milked, when no hard working careful citizen ought to be expected to be anywhere but in bed. Then they persist in giving down such a lot of milk thatit tires a fellow to death to sit on a stool and catch it and actually takes nearly a year to dry the critters off. Cy said that he had one that wouldn't go dry anyway, so he gave her to a neighbor rather than be bothered any longer. And then before a man could rest up after such exertions, it was milking time again with the stock at the gate all bellowing and leaking cream, as sure as you're born . He says he won't stand for it any loger Says he's got a chance to trade his six heifers for 15 Jerseys and their owner says he'll guarantee thewhole bunch won't give as much as three of the black and whites. Cy says there's some things on earth besides Holsteins and money and if he's got to dairy it, he prefers a breed that don't take up a man's whole time. 'Each to his own taste," as the old woman said when she kissed the pig.—Holstein Freisin News Buletin.

RECORDS HELP SELL BREEDING ANIMALS

The present sharp competition in dairy business and the increased price of feed force the successful dairyman to secure the greatest return possible from his outlay. If he has registered cows he expects more for his progeny than if he had only grades. But to obtain more and enough more to pay to keep purebred stock, L. W. Wing, Jr., of the Missouri College of Agriculture, reminds the dairyman that he must be able to answer the following questions from the prospective buyer of a herd sire. Is the sire registered? What is the record of his dam? How many advance registry daughters and proven sons has his sire? And what are the records of his grandams and grandsires? If the breeder is selling a registered cow he must answer: What is her record; the record of her dams and grandams, and the ability of her sire and grandsires to produce advance registry daughters and proven sons?

To answer these questions and meet the demands of thebuyer the breeder of purebred dairy cattle must do official testing. This testing is under the supervision of the various colleges of agriculture. Breeders ready to take up this work or wishink further information should write to the dairy department of the college of agriculture.



Think of all the work this

ALPHA GAS ENGINE

would save you

WITH this simple, strongly built engine you can saw wood, run a pump, cream separator, churn, washing machine, feed cutter or feed grinder, and save time and labor around your farm.

If you need a gas engine, it will pay you to buy a good one. An ALPHA costs little more to begin with than a cheap, poorly designed engine, and will quickly make up for any difference in the first cost by the longer and far more satisfactory service it will give you.

The ALPHA is simple and durable in construction and is free from any of the complicated, delicate parts that make some engines a constant source of irritation and expense. You can operate it with either gasoline or kerosene, and it will develop its full published rating with a minimum amount of either.

An ALPHA is a saving investment any way you look at it. It will save the money you now must pay out to get done work that requires power, because you can own and operate it for less than it would cost you to hire some one with an engine, and it will do quickly work you are now doing by hand and give you more time to attend to other work. The sooner you get an ALPHA, the sooner it will pay for itself.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

THE DE LAVAL COMPANY, Ltd.

NEVER NEGLECT
BRONCHITIS
IT MAY TURN TO PNEUMONIA.

Bronchitis comes from a neglected cold, and starts with a short, painful, dry cough, accompanied with rapid wheezing, and a feeling of oppression or tightness through the chest.

You have, no doubt, wakened up in the morning and have had to cough several times to raise the phlegm from the bronchial tubes, and have found it of a yellowish or gray, greenish color, and you have received relief right away.

This is a form of bronchitis, which if not cured immediately may turn into pneumonia or some more serious trouble.

Cure the cold with Dr. Wood's Norway Pine Syrup and thereby prevent bronchitis and pneumonia taking hold on your system.

Mr. E. Jarvi, New Finland, Sask., writes:—"I was troubled, for years, with bronchitis and could not find any relief. I was especially bad on a damp day. I went to a druggist, and asked him for something to stop the cough and constant tickling in my throat. He gave me a bottle of Dr. Wood's Norway Pine Syrup, which I found gave me instant relief. I think it is the best medicine for bronchitis I know of. Now I take care I always have a bottle of it on hand."

Do not accept a substitute for "Dr. Wood's." It is put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

LIVE STOCK.

Buy a pig
If you want to raise the load,
Buy a pig
O, he's little, but he's wise,
He's a terror for his size,
And he's quick to advertise—
Buy a pig.
If you want the cheapest board,
Buy a pig.
If you want to own a Ford,
Buy a pig.
He is solemn but he's fat,
And he knows just where he's at
And he always comes to bat—
Own a pig.
O, it's really somewhat hard—
Keep a pig.
That he has to end—in—lard
Keep a pig.
He makes sausage ham and sich,
Pickled feet and bacon fillitch,
And he makes his owner rich.
Keep a pig!

SKIN DISEASES AND PARASITES THAT TROUBLE THE STOCK

We know of no better remedy for killing blue lice on cattle than hellebore and cement, one part of the former to four parts of the latter. Both of these ingredients should be fresh and free from lumps, thoroughly mixed and sifted over the animal from head to tail on each side of the spine, with an old tin pepper box or a small tin with holes punched in the lid.

Before the preparation is applied the animal should be thoroughly cleaned with a currycomb so that the hair will be loose and dry, in order that the mixture will readily work down to the skin.

One application, if carefully done, will usually clear the lice off a herd of cattle, but to make sure a second application should be given a week or ten days later. This remedy is very cheap, easily applied and effective.

We havc never tried the hellebore and cement for horses but if we had a case on hand we would not hesitate to do so, since it is so easily applied.

The common remedies for horse lice are: Two pounds of tobacco to three gallons of water steeped for two hours. Sponge the animal thoroughly.

Another remedy is 3 pounds of quassia chips to one gallon of water, steeped for two hours and applied as the foregoing.

The questoin of keeping the herds and flock clear of skin diseases and parasites s one worthy of a great deal of attention. There are thousands of herds throughout the countfy that are rendered unprofitable by reason of the depredations of these diseases. No herd can be at its best when tormented by destructive parasites. Not only do they feed upon the life blood of their victim but at the same time so annoy and distress them that a nervous condition is excited in which it is impossible for an animal to make the best use of its food and other things calculated to improve its condition.

Of all the parasitic diseases that infest cattle, horscs, pigs, sheep or poultry or any other domestic animals body lice is the most common. All classes or animals seem to have thcir own peculiar kind, and which do not usually stay on any other class for any length of time. Herds that are affected with this class of vermine usually show it in the appearance of the hair and in their generally unthrifty condition.

There seems to be no good reason why these insects are allowed to reproduce this species and perpetuate their destruction. It is difficult to exterminate. It is more likely to be a matter of carelessness or inefficienecy on the part of the attendant or the porprietor. Lice may be on a herd of cattle in small numbers for some time if the stock is wel fed, and on this account, even though a herd may look thrifty they should be carefully examined at frequent intervals to see that no skin diseases are present.

It sometimes happens that one or two animals in a herd will become badly infested with lice while the balance of the herd will be comparatively free Where this is the case they will generally show it by their rough hair and their condition. Anything of this kind should be a warning to the herdsman to make a careful examination but as previously noted no one should wait for the sign of disease to make its appearance, but ever be on the watch against any such insidious enemies.

At this time of the year and from now until the grass comes again, parasitic diseases are more common than in the summer time and hence every care should be exercised to be informed of any new epedemic of the kind, and measures at once adopted to overcome it

Some kinds of lice infest the whole building where they are present on the stock, and when this is the case nothing short of a thorough cleansing with some reliable germicide will effect their extermination. Hog lice and poultry lice are of this nature, particularly the latter, which will even annoy horses for some time.

Let every stockman at once take the hint, and examine his herds for lice, mange, ringworm and other skin diseases, and so save much loss and troouble later on.

TRANSMISSION OF PRODUCTIVE POWERS

"Holstein Breeder," writes: "Can you tell me whether the ability to produce butter-fat is transmitted by the dam or sire in the breeding of dairy cattle?"

We recall an exhaustive experiment conducted in the United States with the object of solving the above problem. The plan used was to take bulls havng advanced registry daughters and pick out those daughters which had different advanced registry dams . If then a difference was found between the daughters, it must be attributabe to the dams, since the sire would remain the same in each case. When two daughters were found by the same bull the higher and the lower producer were compared. When

Will Gold Dust dissolve the grease?

Yes! And to discover how *quickly* Gold Dust dissolves the grease make this test. Take a batch of dishes—greasy ones. Wash them with Gold Dust, following the simple directions on the package.

See if Gold Dust doesn't remove the grease with surprising quickness. See if you don't save time.

Try *one* package of Gold Dust. See if you don't find it a superior cleaner for all dirt that you can't brush up or sweep off.

But look closely that it is Gold Dust you *really* get. It is for sale everywhere in large and small packages.

In Cutting Down Food Bills

remember that Purity Flour goes further---makes more bread, rolls, cakes and pies to the barrel and is also rich in body-building qualities. Its use is real economy. Give it a trial in your own home.

PURITY FLOUR

More Bread and Better Bread---and Better Pastry, too.

5

three daughters were found, the highest and the owest were compared and the third discarded; and when four were found, two comparisons were made possible. In every case an even number of daughters was used, except when two or more had the same dam, in which event the records of all out of the same dam were averaged and eartted as only one animal.

A total of 384 daughters having tested dams was found, which allowed of 192 comparisons. In 110 cases out of 192 (57.3 p. c.), the high producing daughters were from dams with the higher records. The average fat production was as follows:

	Pounds
192 low producing daughters..	435.88
192 high producing daughters..	548.10
Dams of low producing daughters	473.50
Dams of high producing daughters	500.57

The influence of the dam on fat-production is evident.. Compiling the data in another way we have:

	Pounds
192 low producing dams.....	428.07
192 high producing dams.....	546.22
Daughters of low producing dams	482.86
Daughters of high producing dams	500.61

While there is a difference of 118 pounds of fat between the high and low producing dams, there is a difference of only 18 pounds between the daughters. This indicates that the sire also has something to do with the inheritance of dairy quality.

By dividing the dams into two groups regardless of the bull to which they were bred, placing in one group all cows producing 500 lbs. or more and in the other all producing under 500 pounds, we have the following:

Number of dam, producing 500 pounds or more.....	132
Number of dams producing less than 500 pounds.....	252
	Lbs. Fat
Average of high producing dams	599.05
Average of low producing dams	428.53
Average of daughters of high producing dams	532.87
Average of daughters of low ducing dams	470.18

All the methods of comparison strongly indicate that fat-producing ability is inherited from the dam as well as from the sire, and that the practice of retaining heifer calves from the best cows for replenishing and building up the herd is sound. The fact, sometimes observed, that with poorer quality cowe and selected bulls high producing daughters have been obtained, must be chiefly considered as an exception which should not be made the basis in the selection of dairy cows for increased milk production.

Saves Shortening

One of the first things you notice, after "Beaver" Flour comes to your house, is that you are using *less shortening* than you used with western spring wheat flours.

You also notice that the Pie Crusts, Cookies and Doughnuts are lighter and flakier—that the Bread Rolls and Biscuits have a delicate flavour, a delightful, nut-like, homey flavour that is doubly welcome after the tough, almost tasteless bread you used to make with western spring wheat flours.

BEAVER FLOUR

Milled of Blended Wheat

is really two flours in one, for two kinds of wheat are used in blending. "Beaver" Flour contains the choicest Ontario winter wheat, strengthened with western spring wheat.

This gives you the finest pastry flour that can be milled—with the right strength to make a good size loaf of bread or a big pan of snowy Rolls.

More than that, everything made of "Beaver" Flour has a deliciously appetizing, nutlike flavour that is entirely lacking in the strong, western spring wheat flours.

Try it yourself—see how you save shortening—see how you come to depend on the even strength and quality of this famous flour—see how everything tastes so much better. Your dealer should have "Beaver" Flour—or will get it for you.

DEALERS—write for prices on Feed, Coarse Grains and Cereals. 199

NURSING SICK COW BACK TO HEALTH

Many times an attendant in preparing a meal for a sick cow places it before and pays no further attention to it other than to observe from time to time whether or not it has been eaten. Sometimes this meal consists of a bran mash or thin slop. Such feed quickly starts to fermentin warm weather and, if the patient does not eat any of it within one or two hours after it has been placed before her, it should be removed. The sight of food continually has the same effect on cows under some conditions as it has upon human beings, causing them to become nauseated.

A sick person usually relishes a change of diet, something fresh and appetizing, some fruit or vegetables of some kind. In this respect a cow does not differ from human beings.

When it is seasonable, young corn plants are sometimes relished by our patients. Always remember that the appetite may be greatly stimulated at times by the use of some fruit or vegetables or other appetizing substances which cows relish. Be careful lest you overfeed the patient after she starts eating.

In preparing mashes or thin slops do not fail to salt them well and do not feed them too hot nor yet too cold.

If the patient is greatly weakened a drench composed of five or six eggs well beaten up and placed in a quart of sweet milk may be given two or three times each day.

A tea made by steeping bright alfalfa or clover hay may be offered to the patient. The hay should be cut up well with shears and packed in a large pail, after which boiling water is poured over it and the pail covered with blankets. This is allowed to stand for acouple of hours after which the liquid is poured off and offered to the patient just slightly warmed.

Only the best quality of feed obtainable should be offered to the sick animal and care should be taken that she be not overfed Fresh and pure water should be before the patient constantly.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address

MRS. M. SUMMERS, Box 309 Windsor, Ont.

FORESTALLING THE PARASITES

The common louse, the sheep tick and certain diseases that may be prevented, like cattle mange and black leg, take a large annual toll from the live stock industry Animals that die of diseases that need not have attacked them had due precautions been taken, and animals that are unthrifty because the mange parasite is burrowing under the skin or the louse is getting in his work on the outer side of the cuticle, represent a waste in food materials and human energy that is undesirable always, but particularly so at this time when both food stuffs and labor are available only at a heavy premium. The measures to guard against loss from the causes mentioned are so simple that one forgets sometimes to take them. They consist chiefly in thoroughly cleaning out and idsinfecting the stables before the cattle are brought in and the use in their proper place of such common remedies as lime, creolin, raw linseed oil, kerosene, crude oil, sulphur, and a little oil of tar. The diseases that cause the heaviest losses in live stock and the causes generally of lack of thrift in animals,may be cured or remover by very ordinary means. But the remedies have to be applied in season, and right now is the time to thoroughly disinfect the buildings the stock go into and take action to forestall the winter activity of the hog and cattle louse, the sheep tick and the less widely known pest of the Scaroptidae family that produces the cattle range.

Much can be done toward the conservation of the resources of the farm by careful use of the by-products and the utilization of feeds that would ordinarily be allowed to go to waste.

THE HORSE

YOUNG HORSES ARE SOMETIMES SPOILED THROUGH OVERWORK

It is sometimes a test of patience and tact to get the young horses well started off in their first year's work. No two horses were ever alike, and each must be broken in differently. A rule for breaking in that would work well with one horse might cause the other to acquire bad habits or a breachy disposition that would greatly lower his value. The first thing we must consider is the disposition of the colt to receive our teaching. It is not proper nor economical to begin training the colt for work any great length of time before he is needed for work, but should allow him to understand from the first that business is business, and this will make him easier to teach when working time comes.

Horses acquire more bad habits a few weeks after they begin work, when their working habits begin to become settled, than at any other time. Make them work well, keeping to the rule, "Business is business." Many horses pull well to a buggy but balk at a small load when worked to a wagon, the result of habits acquired when they started working.

It is much easier to overwork the young horse than many think. Of course, the young horse is stout and able, and might do more work than an old horse if all his energy were expended on draft. But we must not expect this. The young horse is excitable and will waste energy in excitement that the other horse would use in pulling. The colt is also full of animal spirits, and will waste a very great deal of energy in prancing and high stepping. We can and should prevent a great deal of this, but we are likely to excite the horse in doing it, and cause a loss of energy on that score. However, we can allow for this waste of energy and still not overwork the horse. We should understand the draft of any machine, plow or vehicle to which we work the horse. The young horse should not be allowed to work himself into a sweating and frenzied exertion. Treatment of this kind makes the horse nervous at best, and may injure him beyond repair.

The way the collar fits has much to do with the work the horse does and the working habits he acquires. The collar should fit tight and conform to the shoulder of the horse by wetting it the first time we use it and allowing it to dry while he is at work. The hames should fit the collar well, but not to draw it together. Sweat pads are a bother and an irritation. The draft should not be too low at first, for the young horse holds his head high. It may be gradually lowered as the horse settles to his work.

MAMMITIS — UNTHRIFTY HORSE

"I have a cow that started shivering a few days ago. I blanketed her and then she became all right again. Since then the milk in two of her quarters became clotted. They got better but one of the others has gone in the same way. She calved in the spring.

"Also I have a big raw-boned blood horse that is rather unthrifty. His coat is staring although I keep him blanketed. Please advise me what to do in these cases.—C. W. D.

This is mammitis (inflammation of the udder). Purge with 2 lbs. Epsom salts and 1 oz. ginger, and follow up with 4 drams nitrate of potassium twice daily for two days. Bathe the affected quarters well four times daily with hot water, and after bathing rub well with hot camphorated oil. Milk the affected quarters four times daily until the milk becomes normal.

Get his teeth dressed. Give him a purgative of 8 drams aloes and 2 drams ginger and follow up with a tablespoonful three times daily of equal parts powdered sulphate of iron, genitian, ginger and nux vomica. Feed good hay and rolled oats with a little linseed meal, and a feed of bran twice weekly, also a couple of carrots or a mangel daily, and give regular exercise.

WHOLE OR GROUND OATS FOR HORSES

A horse with a good mouth, or set of teeth, does not require to have oats ground for it, and grinding in such cases is only an unnecessary expense, except during periods of hard work when the time alloted for eating may not be sufficient to allow the horse to properly chew and masticate the whole grain. If the horse's mouth is not in good condition for properly chewing and masticating the grain, as in the case of the very old horses, or in the case of young ones whose milk teeth occasionally give trouble by remaining in the mouth too long when the permanent teeth are coming through, it is the proper thing to feed the grain in the ground or crushed form. Horses' teeth however, should be frequently examined and any irregularities that appear be given prompt attention.

The contention that feeding all ground grain to young horses results in injury to their teeth bears some weight; in that, if allowed to do the grinding themselves, their teeth are less liable to wear irregularly as they grow out so as to leave sharp points and ragged edges that cause pain and prevent proper chewing and mastication of the food. And we say that feeding liberally and after careful, orderly method, with plenty of variety is more important than making feeds fine and soft, so that the animals can gorge themselves with little chewing. The organs of mastication and digestion should be kept working at their normal capacity. Pampeing should be avoided.

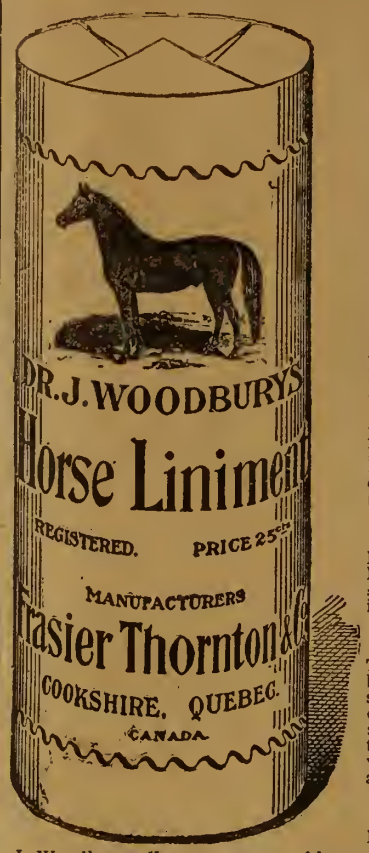
Some horses are naturally given to bolting their food. Though their teeth are in good condition, they eat greedily and swallow their rations without first properly chewing and masticating it. In their case it may be proper enough to feed grain in the ground form, but better results will be likely to come from mixing their feed in the whole form with chaffed straw or hay, or cut-feed as this is comonly termed. Feeding experiments have shown thatwhen horses are fed whole oats in this way the manurial voidings unmasticated is smaller than when the whole oats are fed alone.

DIARRHOEA

"I have a few steers that I am fattening. I feed them chop composed of one pound of buckwheat, 1½ lbs, of barley and 3 pounds of oats. I feed them 1¼ gallons twice a day with oat-straw and one pail of turnips, but it seems to give them the scours. Please let me know the cause and also the manner of treating same.—J. R.

The trouble is probably caused by the buckwheat. There is some local cause. Omit the buckwheat from the chop, and add to the drinking water ¼ of its bulk of lime water. Also give hay instead of straw. If this does not effect a change in conditions, omit the turnips for a time. If diarrhoea should become acute in any case, give 1½ ounces of laudanum and 4 drams each of powdered catechu prepared chalk in a quart of water as a drench every six hours until diarrhoea ceases.

Dr. J. Woodbury's Horse Liniment
THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Linlment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro. N. S.

FRASIER THORNTON, & CO., Limited, Manufacturers: Cookshire, Quebec, Canada

LICE

"I have a team of horses that have pig lice on them. I had the horses and pigs housed together for a short time, but now the horses are away from the pigs, but the lice have not left them and I cannot get anything to kill them. Please tell me what to do for them.—R. J. C.

The most effective application for this form of lice is a plentiful application of oil or grease. One part carbolic acid to 30 parts fish oil gives good results. Of course this is rather productive of dirt, as dust, etc., tends to stick to the animals. A thorough washing with a warm 5 per cent. solution of one of the coal tar antiseptics will give good results. Whatever is used should be repeated every 10 to 14 days until fresh vermin cease to batch out. The horses would be much more easily treated if they were clipped, but it is unsafe to clip them at this season unless conditions are such that very great care can be taken of them in order to prevent chills .etc.

GREASY LEGS

"We have a colt going on five years old that has greasy legs. It is his hind legs, and we would be much obliged to you if you would tell us a cure for it.—H. G.

Purge him with 6 or 8 drams aloes and 2 dram ginger. Follow up with 1 to 1½ oz. Fowlers solution of arsenic. (If the colt be not full grown give less doses according to size) twice daily for a week. Apply to the eruptions three times daily a lotion made of 1 oz. each of acetate of lead and sulphate of zinc to a pint of water. If this dries it up too much use 1 part carbolic acid to 30 parts sweet oil. If little raw elevations known as grapes be present, they should be cut off or burned off with a red hot iron, or if small, removed by the application, once daily of a little butter of antimony.

BREEDING A THREE-YEAR-OLD

"I have a three-year-old Clydesdale mare . Would it be wise to breed her in the spring or would it be better to let her go for another year? I have exhibited her at fourteen fairs and received first every time.—A. J. K."

It will be wise to breed her in the spring. She will be four yeasr old at the time of parturition.

ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

Removes Bursal Enlargements, Thickened, Swollen Tissues, Curbs, Filled Tendons, Soreness from any Bruise or Strain: Stops Spavin Lameness. Allays pain. Does not Blister, remove the hair or lay up the horse. $2.00 a bottle, delivered. Book 1 K free.

ABSORBINE, JR., the antiseptic liniment for mankind. For Synovitis, Strains, Gouty or Rheumatic deposits, Swollen, Painful Varicose Veins. Will tell you more if you write. $1 and $2 per bottle at dealers or delivered. Manufactured only by W. F. YOUNG, P.D.F. 124 Lymans Bldg., Montreal, Can.

POULTRY.

THE LAYING HEN AND CHARACTERISTICS THAT BETRAY HER

A great deal has been said about choosing the laying hen. One writer on the subject says: "Notice the short feathers that grow on the head at the side of the comb. If these feathers curl up and are inclined to point forward, the hen is a good layer. If they lie smooth and close to the head, the hen is a poor layer."

Another writer says: "The layer carries a high tail, and stands high in front with her back not on a level and the rear parts not higher than the front." Such observations can count for but little in the selection of layers, since there are no facts to back up the assertions. The onl positive method of selecting laying hens is by means of the trap nest. This method, however, is practically out of reach of the average farmer, but experiment stations have aided in this regard by "trapnesting" a large number of hens and observing the characteristics of the hens that lay. In this way one is able to secure good results without being put to all the work of trap-nesting the flock.

The following methods are based on results of observations made on trap-nested hens by Prof. J. G. Halpin, of Wisconsin.

The hens that are off the roost first in the morning and last to go to roost at night, are generally good layers. The reason for this is simple. If they require just food enough to supply the wear of the body, it will not take long to secure it; but if they are good egg manufacturing machines, a large supply of food is necessary.

This method was tried by a farmer with a large flock. He had 250 hens and wanted to reduce the number to 150, as that was the capacity of his poultry house. Of course, he did not want to sell his best laying hens to the butcher. How could he pick out the hens that would lay during the winter? He was told of this method and so he closed the door of the hen house after the first 150 hens had left in the morning. It was successful, for he got practically the same number of eggs with 100 hens less. Another plan quite similar to this is to visit the coop at night and feel of the hen's crop, the one with full crop is the active laying hen.

The appetite of the hen is an indication of her productive capacity. Those with good appetites will meet the feeder at the door, and, if at all tame, may hop on to the feed basket. They will scratch the litter about the pen in a vigorous way in search of hidden grain and will be heard to sing contentedly as they work.

Good layers usuelly have bright eyes, full-sized red combs that are pliable and inclined to be slippery. The comb generally shrinks, becomes hard, light colored, and rough when laying ceases. The skin on a laying hen is usually smooth, oily and pliable. A wide, pelvic arch is also an indication of laying. Laying hens usually have loose bowels, but this is largely due to the ration. A hen inclined to be constipated is not getting a good laying ration. It has been noticed that hens with crow heads, that is, long peaked heads, are seldom good layers. The same is true of hens that are unusually long legged.

Late moulting hens are the best layers. Repeated tests show that heavy producing hens moult late and rapidly. This if applied in October and November, is the most important test of all. Late moulting hens have been discarded by many farmers who think that the early moulters are the winter layers. Early moulting hens are usually the winter drones.

Prof. Warren, of Cornell, uses the color of the shank in selecting the winter layers on his large poultry farm. This method can be used only when pellow skinned varieties are kept. A heavy laying hen needs so much yellow coloring matter to color the yolk of the eggs that the skin and shanks are drawn upon to make up the deficiency, causing the feet to become pale or almost white in color.

The degree to which the color fades, varies with the breeding, vitality, feed and range. Orange colored shanks fade slowly, while light yellow shanks fade rapidly. Hens confined in small yards and not supplied with green feed, usually have feet which fade rapidly. Weak or sick birds frequently lose the color of their shanks. Therefore, it is necessary to use this method with caution.

Some strains of Leghorns and other white ear lobed breeds have creamy or yellowish ear lobes before laying begins. Tests at the Connecticut Experiment Station show that the ear lobes become white after a few eggs have been produced. At the Wisconsin Experiment Station it has been noticed that the color of the face and often of the ear lobes of the red lobed breeds fades during heavy laying.

POULTRY NOTES

While it is best at all times to have good, sharp grit constantly before the fowls, it is especially important that grit be supplied when feeding whole oats so that the hulls of oats, which are very tough and unyieding, will be properly ground. With plenty of sharp grit there si no danger attending oat feeding, although the safest rule is to first soak the oats for an hour in water so that they become more softened.

Green bones are bones fresh from the butcher with the adhering gristle, meat, etc.

The sooner farmers recognize the fact that poultry culture should be followed on the same line that dairying is—giving food and care to secure result—the sooner will they begin to reap their share of profits and become competitors with practical poultry raisers.

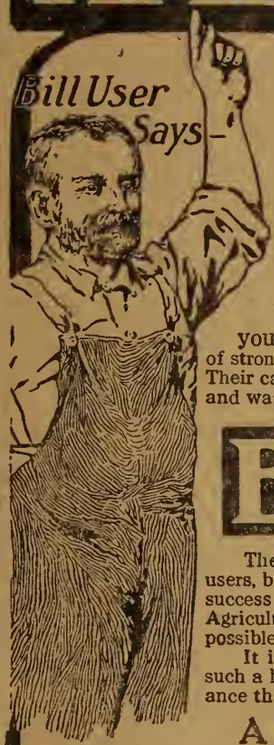
Green bone contains the natural juices as well as the adhering substances, making it superior to the bones that have lain on the ground for a while and lost all the natural juices or animal matter. Green bones are also more soluble and capable of having the mineral matter digested.

In parts of England, turkeys are fattened chiefly on Indian corn, scalded Indian meal and boiled potatoes, with home grown corn for a change.

It is claimed that the most delicious juicy broiler that an epicure can fancy is a turkey poult of about six pounds weight, or when about two-thirds grown, and of medium size. Many a young male, two-thirds grown, woulud be too large to broil; if rather large, however, the breast may be gashed, and thus more easily cooked through, but it must not be dried.

The following facts on marketing turkey feathers are well worth remembering: The quills from the third joint or tip end of the wing are called pointers, and should be kept separate. In packing, keep tail and wing feathers separate. Tie each kind in bundles by itself, and press the bundles in the boxes separately. All of the feathers must be clean, sound and dry-picked. The wing quills should have full plumage on both sides of the quill, which come from the first and second joints of the wing next the body, are more valuable than, and should be kept separate from, the pointers The tail feathers should be kept by themselves, and are the most valuable. The short tail and wing quills, if saved, should be kept separate from the long ones, as they depreciate their value if mixed with them. The directions for shipping are to mark the correct weight and tare on the boxes, also the name of the shippers, and ship as "turkey quills."

HATCH EVERY EGG



"Why gamble with valuable eggs and more valuable time experimenting with an incubator—learning to run it? It's business with you from the start with a **Buckeye** Incubator, because all the experimenting has been done for you.

"You don't **guess** on the hatch, you **get** it—to the full number of hatchable eggs the first time and every time. And good strong chicks too, that grow to quick maturity."

Whether you are a beginner or a big operator, your problem is the same— to get the full hatch of strong chicks. A hatch of weak chicks is worse than none. Their care is a waste of feed and time. You avoid the risk and waste with a

BUCKEYE
THE PERFECT INCUBATOR

The universal satisfaction of over half a million Buckeye users, big and little, proves that there is absolute certainty of success in hatching. Endorsement of the Buckeye by all the Agricultural Colleges and Experiment Stations removes all possible doubt.

It is built **up** to a standard, not **down** to a price. Up to such a high standard of correct principles and exact performance that we place behind it an unqualified guaranty.

A Guaranty That Guarantees

The Buckeye is guaranteed to hatch more chicks and stronger chicks than any other incubator; to operate satisfactorily in any temperature down to freezing; to require no artificial moisture and no attention to the regulator from the time the hatch is started until it is finished. Any Buckeye that fails to meet this guaranty will be taken back any time within 40 days.

We want you to put your Buckeye to a test with any machine. We want you to know for yourself that it is the best in the world. Our guaranty is behind the first hatch and every hatch.

Write for Catalog. It contains the most wonderful lot of testimonials from Buckeye breeders that you ever read. Also letters from Standard Colony Brooder users telling how they invariably raise from 90 to 95 per cent of their hatches in this wonderful brooder. Write a card for the catalog.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

HOW TO ENTERTAIN A GUEST

Hints are sometimes given to those who wish to be agreeable guests. It seems hardly fair that these should have all the advice, since there are some people whom you enjoy receiving in your own house, who do not know exactly how to manage matters when they have company at their own houses.

Now we will have a little talk on the other side of this question of entertainments and will speak of these frequent occasions when, as Dr. Holmes says:

"The visitor becomes the visitee."

There are some people who seem to consider that the obligation is all over when the guest has arrived; but in reality, it has just begun. You are responsible in some degree for the happiness of your visitors from the time they enterd your house until they leave it.

Young girls who have no household cares should feel this obligation especially, but some who do feel it do not know how to make their visitors happy and at ease, and so are so uncomfortable all the time they stay, an because they feel that they do not succed, become discouraged, and at last stop trying. Indeed, there is nothing more discouraging than to feel that you ought to do a thing, and not know exactly how or where to begin; but a few words of help, carefully remembered, may give one a wonderful start in the right direction, so here they are, for those of you who are looking forward to receiving visits from your young friends, with a sort of dread lest they may not have what they call "a good time."

It is not in the finest houses, or in the gayest places, that guests always enjoy themselves most. You must have comething better than elegant rooms, or all the sights and sounds of a big city, to make your home attractive and pleasant. It is a very low grade of hospitality which trusts in good dinners and fine houses alone. It must be a more subtle charm than either of these which will make your house a home to your friends.

All who have ever made visits themselves know this to be true. A cordial welcome, a readiness to oblige, a kind thoughtfulness of the pleasure of others instead of your own, are three golden rules for a hostess to remember. Let us loov at some of the smaller details.

In the first place, have the guest's room in readiness beforehand, so as not to be constantly supplying deficiencies after she comes. Put a few interesting books on the table, and writing materials, if it be only a common pencil, pen, and ink-bottle, wit a few sheets of paper.

Try to make the room show your guest that she was expected, and that her coming was looked forward to with pleasure.

A few flowers on the bureau, an easy chair by the pleasantest window —these are some of the little touches which make the plainest room seem homelike.

If your visitors are strangers, or unaccusteomed to traveling, try to meet them at the station, or to send someone for them. The sight of a familiar face among the crowd takes away that first homesick feeling which comes to young people as, tired and travel-worn, they step from the boat or cars into the sights and sounds of a strange place. When your friend is once established in the guest-chamber, remember that it becomes her castle, and is as much her own as if she was at home; so do not be running in and out two familiarly without an invitation. Let her feel that when you go there the order of things is reversed, and that then you are the guest and she is the hostess.

Let the pleasures which you choose for her entertainment be of a kind which you are sure she will enjoy. It is no kindness to insist on taking a nervous, timid girl on a fast drive, or out rowing if she is afraid of the water, under the impression that visitors must be taken somewhere, when all the time she is wishing she was on solid ground.

Do not invite people unaccustomed to walking to go on long tramps in the woods, and imagine that because it is easy and pleasant for you it must be so for them, nor take those who are longing for music to see pictures instead, while you are boring the picture-lovers, who may care nothing for music, with concerts. A little ingenuity and observation will give you enough knowledge of your friend's real taste to prevent you from making those mistakes; and, indeed, there will be little danger of your doing this if you keep in mind that the kindest thing you can do is to let guests enjoy themselves in their own way, instead of insisting that they shall enjoy themselves in yours. If they are fond of books, let them read in peace. I once heard a lady, who thinks herself hospitable, say to a young friend who was looking over a book which lay on the table, "If you want to read that book I will lend it to you to take home, but while you are here I want you to visit with me."

Let your friends alone now and then and do not make them feel that you are constantly watching over them. Some people, in trying to be polite, keep their guests in continual unrest. The moment one is comfortably seated, they insist that she shall get up and take a chair which they consider more easy. If she sits in the center of the room, they are sure she cannot see and if she happens to be by a window, they are afraid the light will hurt her eyes.

There is so place where there is more uncomfortableness than at the table. An entire visit is sometimes spoiled for a sensitive guest by having her friends say, from a mistaken kindness, "I am sorry that you do not like what we have. Cannot we get you something that you will like better " in this way calling the attention of the whole family to her, and making her feel that they consider her difficult to please. You can get something different for her the next time, if you choose; but do not let her feel that you are too carefully watching her plate.

Do not make visitors feel obliged to account to you for all their comings and goings, or tire them by constant and obvious efforts to entertain them. Unless they are very stupid people, they will prefer to entertain themselves for a part of the time, even though you make them feel that your time is at their disposal whenever they want it. I heard two friends talking, not long ago, of a place where they were both in the habit of visiting.

"How pleasant it is at Mrs. Chauncey's!" said one. "If you want her to go anywhere with you, she always makes you feel that it is just the place where she wishes to go herself."

"Yes," replied the other, "she never makes a fuss over you, but acts as if you did not cause an extra step to be taken, so that you don't worry all the time for fear you are making trouble; and if you want her advice about anything you are doing, she is always ready to stop her own work and show you just what you want to know, and makes you feel as if she was doing it for her own pleasure instead of yours —so much nicer than the way some people have of acting as though you were a constant interruption."

If any excursion is planned, and for any reason you find that your friend will be really happier to stay at home, do not insist upon her going, or allow the party to be broken up on her account. If she would really enjoy more to have you go without her, do not insist upon remaining with her. A friend of mine suffered much by being obliged to go on a steamboat excursion with a cinder in her eye, because she found that her friends would not do as she wished, and leave her quietly at home, and so, finding that the pleasure of a whole party would be broken up, she endured the pain of going with them, when she might have passed the afternoon in comparative comfort at home.

In the same way, some people will insist upon going about on business with a guest, who would much prefer to go alone.

In regard to conversation, remember sweet George Herbert's rule:

"Entice all neatly to what they know best,
For so thou dost thyself and them a pleasure."

Talk of the people and things which are most likely to interest those whom you wish to please. You would think it very rude to speak in a language which your visitor did not understand, and it is about the same thing to talk of matters in which they have no interest, an which they know nothing about. Every family has its sayings and jokes, which sound very funny to them, but unless they are explained they mean nothing to a stranger.

Do not ask many questions about your guests personal affairs, since you are taking them at a great disadvantage when they are in your own house, as they will not like to refuse to answer. Be careful not to be too ready with advice about a visitor's dress. If she asks you what is most suitable to wear on any occasion, tell her frankly; but above all things do not say or lo anything which shall indicate that you do think her clothes are not as pretty and fashionable as they ought to be. Sometimes a remark made with the kindest intentions will hurt a sensitive girl's feelings. Those of you who have read "The Diary of Mrs. Killy Trevelyan" will remember how the little country cousin felt when she saw Evelyn smile at the dresses which had been made with so much care. I once heard a lady speaking of her girlhood, when she made her first visit away from the farm where she had always lived. She said, as she looked back upon it, she always wondered at the kindness of the friends who received her cordially, and took her about with them cheerfully, when her dress was such as to make her laugh heartily at the mere recollection of it.

Before your guest comes, tell your young friends of her expected visit, and ask them to come and see her, and if you invite company to meet her, do it as soon as convenient after she comes that she may not feel that she is among strangers during the most of her visit. Western people coming East often think they do not receive a very cordial reception, because they meet so few people. A lady remarked to me quite recently that she did not know whether the friends she had been visiting were ashamed of her appearance or of the appearance of their own neighbors. She concluded it must have been one or the other, as no pains had been taken to have them meet each other.

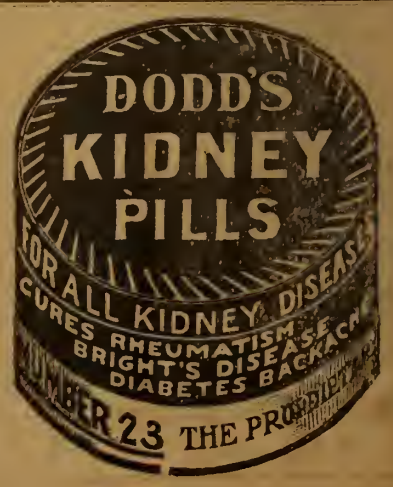
Do not ask visitors what you shall do to entertain them. That is your business, and you should not be so indolent as to shift it from your own shoulders to theirs. There may be many things which they would enjoy that they will hardly venture to suggest. Try and have a pleasant plan for every day. It will require thought and care on your part, but it is worth while. I do not mean, that you must be constantly taking them to some great entertainment. This is only possible to a few of you. In the most quiet country village some little visit or excursion may be easily found, if it is nothing more than a game of croquet with some pleasant girls, or an interesting story read aloud. Do not make the mistake of thinking that because things are old and dull to you, they are so to every one else. To the city girl, who goes weary and worn-out from the dust and heat of brick walls and pavements, the pleasant stroll in the woods, which is too familiar to please you, may be a fresh delight. So, to the one who has passed all her life among green fields, the sights and sounds of a city may be a great pleasure, even though it may

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

A MESSAGE TO WOMEN!!

Mrs. M. Summers, Box 309 Windsor, Ont.



Had Heart Trouble

For 5 Years.

WOULD GO INTO FITS.

Through one cause or another a large majority of the people are troubled, more or less with some form of heart trouble.

Little attention is paid to the slight weakness until the heart starts to beat irregularly, and they suddenly feel faint and dizzy, and feel as if they were smothering.

On the first sign of any weakness of the heart Milburn's Heart and Nerve Pills should be taken, and thus secure prompt and permanent relief.

Mrs. W. H. Ferrier, Kilbride, Ont., writes:—"I was troubled with my heart for five years, and was so bad it would send me into fits and smothering. I could not do any work while I was affected, but after taking three boxes of Milburn's Heart and Nerve Pills, I have regained my health."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

not seem possible to those who are tired of them.

It is surprising how many things there are to see, in any locality, if any will only take the trouble to find them; and the hope of making a visit pleasant to a friend is a good incentive to help one in the search.

If you cannot give your young visitor any elaborate and expensive pleasures, do not be discouraged. The sight of a brilliant sunset from some neighboring hill; a walk down broadway; the inside of a great factory, where the throbbing looms are full of interest to stranger eyes—if you have no more wonderful sights than these to show, these are enough.

Do not think it necessary to insist upon riding with your friends, if there is not room enough for you without crowding the others. I knew a lady who turned to her sister, who was visiting her, when but one seat in the carriage was left, and said: "Shall you stay at home, or I?" The guest replied that she was willing to give up, if necessary; whereupon the hostess handed her the baby and drove off, although she knew that her sister had particular reasons for wishing to go with the rest. This is almost too bad to tell of, even though it is true; but it exactly illustrates how selfishness in trifles may grow upon one unconsciously, until it becomes a controlling power. This fault has been rightly called "the tap-root of all other sins," and is the greatest difficulty we have to overcome in acquiring habits of uniform courtesy and consideration for others.

Do not urge your guests to extend their visits after they have clearly explained to you that the time has come for them to go, and that it is inconvenient for them to stay longer. Let the subject drop, merely letting them know that you are sorry to part with them. Do not convey the impression that you think you can judge better than they can of their own affairs, by constantly teasing them to stay, and saying that you are sure they could do so if they pleased:

"For still we hold old Homer's rule the best,
Welcome the coming, speed the parting guest."

DIRECTIONS FOR KNITTING SOCKS

Some little time ago, at the request of one of our readers, we published particulars regarding the knitting of mitts. We are in receipt of a letter from a reader stating that she was successful in knitting a very nice pair of mitts from the directions given, and asking for instructions regarding the knitting of socks. At this time when so much knitting is being done for our soldier boys overseas, we have pleasure in publishing directions for the making of socks for the benefit of those who may be desirous of knitting for the folks at home or helping in this great war work in their spare moments during the winter months, but who may not be sufficiently expert in the art of knitting to do so without having directions before them.

Materials required—6 ounces 3-ply woolen yarn; 4 No. 11 knitting needles.

Cast on 60 stitches, 20 stitches on each of three needles.

Work in rib of knit 2 and purl 2 for 32 rounds. Work 11 inches in plain knitting with no shaping.

For the heel, put 30 stitches on the first needle, then eually divide the remaining stitches (required for the instep), on the second and third needles —both of which should be left until the heel is finished.

On the 30 stitches knit, alternately plain and purl, 30 rows, always slipping the first stitch. To turn the heel knit 18, slip 1, knit 1, pass the slipped stitch over the knitted, turn, purl 8, purl 2 together, turn, knit 8, slip 1, knit 1, pass the slipped stitch over the knitted, turn, purl 8, purl 2 together, turn, knit 8, slip 1, knit 1, pass the slipped stitch over. Continue working in this manner until all the stitches are worked in, leaving the 9 stitches on the needle under the heel, knit the 2 centre stitches together.

For the instep, follow on with the first needle and knit up 15 stitches on the side of the heel; knit on to the second needle the 30 stitches which were left for the instep when commencing the heel; then, with the third needle, knit up 15 stitches on the other side of the heel while adding 4 from the first needle.

Knit 2 rounds plain, then begin the decreasings, knit the 3rd and 4th stitches together from the end of the first needle and, on the third needle, knit 2, slip 1, knit 1, pass the slipped stitch over the knitted. Do this in every third round until there are 15 stitches on each of the first and third needles. Knit without shaping until the work measures 7 inches from the heel.

For the toe, * knit to the last 3 stitches on the first needle, knit 2 together, knit 1; on the instep needle, knit 1, slip 1, knit 1, pass the slipped stitch over the knitted, knit to the last 3 stitches, knit 2 together, knit 1; on the third needle, knit 1, slip 1, knit 1, pass the slipped stitch over the knitted one, knit to the end of the needle.

Knit 1 round plain. Repeat from * until the toe is reduced to 24 stitches.

Divide the instep and foot stitches equally on two needles. Turn the sock inside out and cast off the two needles together.

Another way of finishing the toe which is greatly in favor at the present time, on account of the fact that it makes a seamless toe, is as follows:

When the 24 stitches are left on the two needles, break off the yarn, leaving about 12 inches on the work, thread this in a darning needle and prepare the stitches by drawing the yarn through the first stitch of front needle as if for purling, then through the first stitch of back needle as if for knitting, then through the first stitch of front needle as if for knitting and take this stitch off, * draw through next stitch of front needle as if for purling to prepare stitch, then through first stitch of back needle as if for purling and take this stitch off, prepare next stitch of back needle as if for knitting, draw through next stitch of front needle as if for knitting and take this stitch off, repeat from * until all are taken off.

THERE'S AN OPPORTUNITY FOR EVERYONE, NO MATTER WHAT HIS WALK IN LIFE—ARE YOU "DOING YOUR BIT?"

Every person in Canada can help solve the national food problem.

The responsibility does not rest entirely on the farmer. Bankers, business men, lawyers, doctors, bookkeepers, clerks, mechanics, and even boys and girls can all help.

Bankers can help by making it possible for the farmers to get money easily for extended farming operations.

The business executive who has had experience in organizing large working forces of men can render excellent service in helping mobilize the food-production resources of the state.

The merchant can help by extending generous credit where it is needed and where the reason is actually that of using funds for increased food production.

Seed dealers, implement dealers and harness dealers will find an opportunity for service in making it easy and convenient for the farmers to get the things they have to sell under terms which will make it possible for them to proceed with the work at once.

And all of us, big or little, can help in the actual production by planting and tending a garden. If we can't, for any reason, o this, let us finance some fellow who can.

Let's "do our bit."

But production is not the only thing to be done this summer in order to solve the food question. Food must be saved. No smallest portion should be wasted. And here, again, all of us can help.

In the first line trench in the food conservation campaign are the housewives of the state. In the kitchen, where the food first enters the house, is the place where the greatest economies can be practiced.

No scrap of meat should be thrown away. Convert them into soups, hash, or croquets, and utilize every bit of

VOLPEEK

MR. M. ARSENEAULT TELLS WHAT DODD'S KIDNEY PILLS DID FOR HIM

They Gave Him Quick Relief From Headache and Backache—He Recommends Them to All Sufferers.

Cape Egmont, P.E.I., Jan. 21st—(Special.)—Dodd's Kidney Pills have numerous friends in this tight little Island, and among the most enthusiastic of them is Mr. Mathurin Arseneault, of this place.

"I recommend Dodd's Kidney Pills to all who suffer." Mr. Arseneault says. "I had been troubled with headache and backache about two years till I read in Dodd's Almanac how many sufferers had benefited by using Dodd's Kidney Pills.

"I decided to send for two boxes. Before I had finshed taking them I was feeling as well as ever.

"It gives me great pleasure to say a few words for Dodd's Kidney Pills."

All over the island you find people who tell of benefits received from Dodd's Kidney Pills. They are recognized as the standard remedy for kidney pills. Acting directly on the kidneys, they refresh and invigorate those organs. The result is that they do their full work of straining all the impurities, all the seeds of disease, out of the blood. That is why Dodd's Kidney Pills are recognized as a tonic.

the fat and grease so that every ounce of nourishment is extracted.

Boil potatoes in their jackets. Experiments conducted at the North Dakota Agricultural college recently revealed the fact that one-fifth of a given quantity of potatoes is wasted when they are peeled raw. Besides, a large part of the nourishing properties of the potato lies directly beneath the skin.

Save small pieces of bread, unfit to serve on the table, and convert them into puddings or dressings for meats.

Prepare now for the summer vegetables. See that your kitchen equipment is in shape and definitely plan to can every vegetable raised in your garden this summer over and above what are needed for immediate consumption.

If there is fruit on your place, can every bit of it you do not eat.

Plan to store such vegetables as will keep without canning, so they may be saved for winter use.

Keep some chickens and feed them such scraps as simply cannot be converted into human food. If they produce more eggs than you can consume, save them by putting them into a water-glass solution.

Are you "doing your bit?"

HELPFUL HINTS THAT MAKE THE DOLLARS GO FARTHER

The syrup from sweet pickles may be used in place of boiled cider in making mince pies.

When you see a hole in your linoleum fill it with a mixture of ground cork and glue, to keep the hole from enlarging.

In opening your jelly glasses save the paraffin for next year's jelly-making, for the paraffin can be melted and used with equal success again.

You can still use broken talking-machine records. Cut the minto uniform parts, tie these in a small piece of muslin and you have excellent ironing wax.

To keep cheese from getting dry and hard, wrap it in a cheese cloth wrung from vinegar, and keep it in an earthen or glass jar with the cover slightly raised.

When a tablecloth is so worn out that recutting into napkins is a waste of time, make roller towels of it for the kitchen. Even though worn, they will last surprisingly long.

Gingham curtains. A well-known interior decorator has introduced a novel effect in window hangings by the use of checked ginghams, from 15 cents a yard upward, in place of cretonne.

To save quilt cotton use worn-out stocking tops. Cut off the feet and open the tops. If outing flannel is used for quilting the stockings need not be sewed together. Children's or ribbed stockings are especially good for this purpose.

Do not throw away your powder-box because you think it is empty. If it is a pasteboard box, cut a slit in the side; if a can, pry open the top. You will be surprised at the amount of powder you will find in the bottom and on the sides of the box.

To cook prunes without sugar, mash one pound of prunes, cover them well with water, let them stand overnight, bring to a boil, set on the back of the stove and let them simmer all day. Add a pinch of salt. The longer the prunes are cooked the sweeter they will taste.

Beans and drippings, combined, make a good shortening for pie crust. Cook the beans until well done, season with salt, and mash until they are as fine and smooth as lard. One cupful of mashed beans mixed with two tablespoonfuls of clear meat drippings may take the place of one cupful of shortening.

One clever woman restored the worn place in her bedroom rug by painting it with ordinary water colors the same shade as the carpet, using enough water to make the coloring liquid quite thin. She then reversed the carpet so that the painted spot was under the bed and the unworn part in front of the bureau.

Baby's folding bath screen. A very useful screen for baby's bath can be made from a wooden drying frame (twenty-five cents in most kitchen furnishing stores), covered with nursery cretonne on the outer side and lined with rubber sheeting or oilcloth

Startling Facts Brought Out By Strict Medical Examination

THIS great war, with all its suffering and terrors, is teaching us many lessons. As the result of strict medical examinations many are learning of defects and of derangements which they had not even suspected.

Recently a record was kept of several thousand men who were examined. The average age was 30, and 97 per cent. were found to be defective in one way or another. Most of those included in this class were unaware of any impairment of health.

35 per cent. were found to have derangements of the kidneys and 23 per cent. hardening of the arteries.

Many of these men would live for years, but life could be greatly prolonged by immediate steps to improve health, and in many cases the derangements would entirely disappear.

35 Per Cent. of Several Thousands Examined Had Kidney Trouble

The Evidence

Mr. J. F. Robson, R.R. No. 4, Komoka, Ont., writes: "I am certainly glad to recommend Dr. Chase's Kidney-Liver Pills to anyone suffering from kidney trouble. I suffered for a long time from kidney disease and pains in the back. I commenced using Dr. Chase's Kidney-Liver Pills, and found that by using two pills a week the kidneys and bowels were kept in perfect order, and that I had no more pains in the back. We always keep these pills in the house for general use."

Mr. A. D. MacKinnon, Kirkwood, Inverness Co., N.S., writes: "I can highly recommend Dr. Chase's Kidney-Liver Pills to all suffering from weak kidneys. I suffered from kidney disease for a long time. I may also say that for three years I was nearly always troubled with headaches, and no treatment seemed to do more than afford temporary relief. I was finally told of Dr. Chase's Kidney-Liver Pills, and after using a few boxes was completely cured. I have also used Dr. Chase's Ointment, with the best results, and never fail to recommend these wonderful remedies."

You may know something of the reputation of Dr. Chase's Kidney-Liver Pills as a means of overcoming derangements of the kidneys. Reports of cures are appearing in the leading newspapers throughout Canada. There can be no doubt of the efficiency of this great medicine. But how are you to be aroused to your condition?

Backache is one of the early symptoms, headache, loss of flesh, dryness of the skin are others. Deposits in the water after standing for twenty-four hours are a positive warning.

Dr. Chase's Kidney-Liver Pills are effective when other treatments fail, because they awaken the action of the liver and bowels as well as the kidneys. They reach the source of trouble when most complicated. You can depend on them for splendid results.

Dr. Chase's Kidney-Liver Pills

One pill a dose, 25c a box, 5 for $1.00, at all dealers, or Edmanson, Bates & Co., Limited, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

BIG MONEY IN "ORNERY" HORSES

MY free book will amaze you. See the big money that is being made by those I taught my famous system of horse breaking and training! Wild colts and vicious, unmanageable horses can be picked up for a song. By my methods you can quickly transform them into gentle, willing workers and re-sell them at a big profit. You can also earn fat fees breaking colts and training horses for others.

Write! My book is free, postage prepaid. No obligation. A postcard brings it. *Write today.*

Prof. JESSE BEERY, 701 Main St., Pleasant Hill, Ohio

with cretonne pockets. Paint the frame with white enamel.

A pastry bag for icing cakes can be made at home. Fold a twelve-inch square of rubber cloth from two opposite corners. Sew the edges together to form a triangular bag. Cut off the point to make an opening large enough to insert a tin pastry tube. A stiff manila paper rolled into cone shape. with a fancy opening cut at the tip, will answer the purpose. nad with a little practice excellent designs can be made.

If light furs have become soiled you can easily clean them at home by the follwing method: Mix together two cupfuls of flour, two cupfuls of bran and a quarter of a cupful of Fuller's earth. Brush and shade the furs well, lay them on a table and rub in the mixture with a coarse piece of flannel, rubbing the fur the wrong way. Shake out all the cleaning powder and go over the furs a second time, using only bran; shake the bran out and wipe the fur with a clean cheesecloth.

THE HABIT OF TALKING AILMENTS

Talking about one's ailments is a habit, and a habit which. if once formed, is hard to get rid of. When we meet a friend and they say "How do you do?" they do not expect or wish us to go into a detailed account of our physical ailments, but how many people take advantage of our national salutation to unload sickness and suffering on their friends and acquaintances. "This world is so full of a number of things" that there are many delightful subjects for conversation. And how we all love the cheery, wholesome person, who. after a few moments of conversatin. leaves us with a pleasant sensation of uplift and inspiration that is a real physical and mental tonic.

A person in perfect physical condition is unusual. Nearly every man and woman has some sort of physical ailment that if enlarged upon will assume momentous proportions. All have pains and aches which if ignored will disappear. "A merry heart doeth good like a medicine," and the merry heart does not entertain thoughts of ill-health, to unload on all who have the patience to listen.

We should all be sympathetic for real sickness and suffering. but it is well to ignore the complaining hypochondriac.

The old way of carrying fowls by their legs, or by their wings, is not practised by the present-day poultrymen. It is a cruel practise. Holding the fowl firmly by the legs and allowing the body to rest on the arm is a much better method.

THE DEHORNING OF CATTLE

The dehorning of cattle can be satisfactorily performed without other apparatus or instruments than a good strong clothesline and a clean sharp meat saw, or a miter saw with a rigid back. The same simple means for controlling the animal is just as applicable when dehorning clippers are to be used as when the horns are to be removed with the saw. The head of the animal is secured to the horizontal rail or stringer which holds the upper ends of the stanchion boards. The animal is put in the stanchion in the usual manner; then one end of a heavy clothesline is passed around the upper part of the neck and tied in a knot that will not slip, otherwise it will choke the animal. The free end of the rope is now carried between the horns, through the stanchion to the front, up and over the horizontal stanchion rail, then down underneath the neck and up over the top of the stanchion rail to an assistant, who should hold it firmly. Now open the stanchion, allowing the animal to withdraw its head; then, keeping the rope tight, pass it once around the muzzle, up and over the stanchion rail and through to the front again to the hands of the assistant, who should stand 3 or 4 feet in front of the animal and hold the rope firmly, but prepared to release it when told to do so by the operator. The animal is now ready for the dehorning operation.

It is necessary that the rope be held by an assistant, as in the event of the animal struggling during the operation so as to throw itself off its feet, or if there appears to be danger of its choking, the rope may be slackened promptly at the word of the operator and the animal partly released. This, however, is rarely necessary, for as soon as the head is secured the operator should be ready, standing at the right shoulder of the animal with his saw, and proceed to saw off first the right and then the left horn. It is a good plan before commencing the real work to experiment upon an animal on the matter of control by tying the head to the stanchion rail as described.

If the stanchion rail is too wide to permit of properly securing the lower part as well as the upper part of the animal's head, the turn of the rope around the muzzle may be omitted and the last lap of the rope carried around the stanchion rail to the front and to the hands of the assistant. Care should be taken that the rope pass each time over the neck of the animal to the stanchion rail between thehorns in such a way that it will not interfere with the work of the saw.

The horns should be severed from a quarter to half inch below where the skin joins the base of the horn, cutting from the back toward the front.

If the cut is made too high an irregular, gnarly growth of horn is very apt to follow. It will be seen that the point of union of the skin and horn varies in different cattle; hence there can be no rule of measurement, except as the eye becomes trained to see the point or line at which the cut should be made. In the beef breeds fully one-half inch of skin, all around, is usually taken off with the horn.

Instruments for Dehorning

In recent years, since dehorning shears or clippers have come into use, this means of dehorning is considered by some cattle owners to be preferable, especially where large numbers of cattle are to be dehorned. One type of dehorning has a stationary knife blade, with its cutting edge shaped like a very wide V, and opposing this another knife of similar shape, moving in a slide, so that the cutting edges cut the horn from all four sides at once, all the edges passing the center at the same time. Another type has a movable knife with one oblque or one curved edge, and the cutting is done in one direction only. The power for cutting with these instruments is supplied by pulling together handles, which, in order to transmit a greater force, are generally so constructed that they act through the medium of a series of cogs.

In dehorning with these instruments the opening between the cutting edges should be slipped down over the horn and the knives closed so that their edges set firmly against the horn in such a position that the cut will be made in the right place and in the right direction. The blades should be kept covered with a thick oil or grease. The handles shouuld be drawn together with a quick, firm, strong pull, so that the horn will be completely severed by the first act and without twisting. Care should be taken to keep the blades sharpened on their original bevel.

Treatment After Dehorning

It is not usual to apply any preparation after the operation of dehorning to prevent bleeding, as the loss of blood is not sufficient, as a rule, to be of consequence. Care should be taken, however, to prevent substances frm getting into the openings left after the horns are removed. The horn cores are elongations of the frontal bones of the skull, and are hollow. They communicate with the frontal sinuses, or air spaces, of the head; therefore foreign substances or fragments of horn which act as an irritant in these cacities are apt to set up inflammatioin, resulting in the formation of pus or an abcess, which may prove qute serious. This trouble is of infrequent occurence, but would appear more liable to happen when the dehorning instruments are used, on acount of their tendency to crush, especially in the case of old animals, whereas the saw cuts clean. If proper care is taken, however, such an occurence following dehorning may in almost every instance be avoided.

Occasionally animals after being dehorned and turned out of the stable will rub their heads against a dirt or gravel bank or the rough bark of a tree, and foreign material may thus get into the cavities, though usually the soreness of the parts is sufficient to prevent this.

PEERLESS GATES
Down the road or far across the fields is often an "entrance," a mere hole in the fence, a constant source of danger to stock getting through. The best way to
Keep Your Stock Where You Want Them
is to provide real gates, strong and durable. All Peerless Farm Gates are of heavy open hearth steel wire on strong tubular steel frames electrically welded in one solid piece, and braced like a steel bridge. No sag, no rust, no wearing out. Ask your dealer to show you Peerless Gates, also Peerless Perfection Farm and Poultry fencing with the famous Peerless lock at all intersectious.

The dehorning aperation should always, when possible, be performed in cool weather, and upon animals which have at least attained the age of two years.

To Prevent Horns Growing on Young Calves

When circumstances are favorable, as in the case of farmers who build up their herds by raising the progeny, the horns may be prevented from growing by a simple and practically painless method, and the custom of preventing the growth of the horns is becoming more popular and more generally practised under all conditions except in the case of calves dropped on the open range. The calf should be treated not later than one week afetr its birth, preferably when it is from three to five days old. The agent to be used may be either caustic soda or caustic potash, both of which may be procured in the drug store in the form of sticks about the thickness of an ordinary lead pencil and five inches long. These caustics must be handled with care as they dissolve the cuticle and make the hands or fingers sore. The preparation of the calf consists in first clipping the hair from the parts, washing clean with soap and warm water, and thoroughly drying with a cloth or towel. The stick of caustic should be wrapped in a piece of paper to protect the handsand fingers, leaving one end of the stick uncovered.

Moisten the uncovered end slightly and rub it on the horn buttons or little joints which may be felt on the calf's head, first on one and then the other, alternating, two or three times on each, allowing the caustic to dry after each application. Be very careful to apply the caustic to the horn button only. If it is brought in contact with the surronding skin it will cause pain. Be very careful also not to have too much moisture on the stick or caustic, as it will remove the skin if allowed to run down over the face. After treatment, keep the calf protected from rain, as water on the head after the application of caustic will cause it to run down over the face. This must be carefully avoided.

Either caustic soda or caustic potash alone, without the admixture of other substances, answers the purpose satisfactorily. Some years ago, however, certain preparations of "dehorning compounds," composed largely of one or the other of these caustics, were generally used, and as inquiries are still occasionally received concerning such preparations, the following formula is given: Combine in an emulsion 50 per cent. of caustic soda, 25 per cent. of kerosene, and 25 per cent. of water. The caustic soda is dissolved in the water and heated to the boiling point, then removed from the fire, and the kerosene gradually added, while the mixture is vigorously stirred. This emulsion is applied in very much the same manner as the thick caustic, except that it is necessary to employ a short stiff brush. Sometimes a meat skewer is used, the large end being mashed to form a stubby brush. Two or three appuications should be made to each horn button, as in the case of the stick caustic, with intervals to allow it to dry.

In the very young calf the horn button, or point that will ultimately develop into a horn, has scarcely any attachment to the skull, and may be felt as a small button embedded in the skin. In this early stage it may be easily removed with a sharp knife or a pair of curved scissors, but even then the caustics should be used to kill any remaining cell life belonging to this germ point; otherwise there may be come subsequent irregular horn growth, which is more or less of a disfigurement.

DAIRYING AND THE DEVELOPMENT OF DAIRY CALVES

(Continued from page 226)

in a position to have everything on the place thriving. By having the cows calve at different seasons, a regular supply is available and can be fed to calves up to a yera. and even if the amount is only a few pounds, it makes for continuous growth and thriftiness.

I believe the success of the live stock business depends on the amount of milk we can produce the year around. In order to be successful stock raisers, we must have some system of raising calves that will guarantee making a success of each years lat—that will develop every calf properly. Despite all the examples and articles written on this subject, the majority of farmers in this province cannot or do not grow their calves properly or economically. My opinion is that there are more buyers of good bulls today than raisers of good calves. Very many farmers do not get the most out of feeding their skim milk, and although I am going over old ground. my advice is not intended for those who have mastered the problem, but to the many who have some calves every year "that do not seem to do well."

The trouble generally is in not letting the calf get quite fat enough before changing from whole to skim milk. No time allowance should be follwed. If you have decided to raise the calf, let it get a good lot of baby fat. Most thrifty calves will be in shape at from two to four weeks to take a little skim milk. While a calf can often be given almost all the new milk it can drink without injury, none of them can stand to much skim milk. My practice is to always weigh each calve's milk up to 3 months old. No one should consider this to much trouble, as a spring balance scale hung near the separator is all that is necessary, and the little time taken is time very well spent. I never think of feeding youngsters without weighing their milk, as it is the only sure way of avoiding scours. If a calf is taking nine of ten pounds whole milk twice a day at three weeks, as a large calf generally will. I drop back one pound as a safety first precaution.

When part skim milk is first introduced, and another pound when on a full skim milk ration, better have them go just a little hungry than risk indigestion and scours. I supply a meal mixture where they have access to it from birth, also hay and roots when they are a month or so old. At the present time my six three-months old calves running together in a box stall. get twenty pounds skim milk each per day, sixty pounds turnips and ten pounds meal mixture, about equal parts crushed oats, bran and oil cake meal. and all the hay they can eat. I never had calves growing faster nor in better condition. The chief trouble to guard against in calf raising is over-feeding of milk up to three months, and in not increasing their grain, root and roughage ration fast enough as they grow. Calves of a large breed, grow so fast and develop appetites accordingly. that like feedenced p3crg f.uhE m..a a..l fli.—xing a big growing boy, only experienced persons can get it into their head how very much they require. Don't imagine this is costly feeding. It is probably the cheapest growth that we can make, as a well fed animal makes nearly half its mature weight up to one year. Having a small body to support. nearly all the feed goes to growth. After three or four months, when a calf is eating plenty of other feed, it is not so easily put off its feed and we seldom need to increase its milk ration above twenty pounds a da yif we have plenty of other feed, although if skim milk is plentiful and the desire is to grow a big calf for the age. increasing the skim milk will grow it faster up to surprisingly large quantities, if we do not increase to fast. For economical reasons, as the calf grows larger and requires more liqiud, we generally add water to its milk. seldom going over 24 pounds skim milk a day at any age. The longer we can keep the milk ration up, the faster will the animal develop.

Every person in charge of feeding calves must learn to be observant and watch closely for any indication of scours, and if noticed in time, a limiting of the milk will be all that is necessary. Increase the meal. roots and roughage as they see mto require it, giving all the hay they will clean up twice a day. If it is the intention to breed the heifer to calve before thirty months, she must be fed generously winter and summer. A heifer well grained and fed may drop her first calf at twenty-four months without stunting her or causing any other injury. I believe such heifers make the most persistent milkers if handled in this way. The average farmer had better not let them have their calves until at least thirty months, if they have to rough it summer and winter, if we desire to keep up the standard size of the breed. whatever that may be.

Dairying is the soundest, safest and surest business any progressive farmer can take up, and in conjunction with well bred cattle. one of the most pleasant of occupations. Good cows are essential to success. They can be bred and raised by everybody, and the surplus will now command a price that will pay us well for the trouble of raising them. Aim to breed and raise large cattle of good type as well as good producers. No one likes a homely cow, and good producers need not be that sort. Don't try to raise too many calves, but try to develop every one properly. A cull is a continual loss and an eyesore. and this sort is usually developed in infancy, so keep a careful lookout for the calves.

W. M. LEA, P. E. I.

Two Extra Cans of Milk

Royal Purple Stock Specific will increase the daily flow of milk per cow, two to five pounds per day while in the stable. You simply mix this pure conditioner with the other meals you are feeding. Its action aids digestion, purifies the blood and improves the condition of stock.

Royal Purple Stock Specific

will put flesh on the poorest, most run-down animal on your farm. We stand back of this guarantee to the extent that we will refund your money if it does not give the desired results when directions are followed.

PUT ROYAL PURPLE STOCK SPECIFIC TO THESE TESTS: See if it will increase your milk flow. See if it will improve the condition of run down animals. See if it enables you to market pigs a month earlier. We know it does all these things. We ask you to try it—and benefit by its use. Sold by dealers everywhere in large and small packages.

HOGS IN HOT WEATHER

During hot eather there is no other living creature on the farm that suffers as much from heat as the hog, and many valuable animals have been lost from this cause. A hog is much more likely to get too hot in summer than he s to get too cold in winter. In every summer pasture there ought to be plenty of shade and good water. Plenty of these in a pasture will save on the grain feeding bills later on.

Trees maks the best shade, and I am fortunate in having plenty of trees and an abundance of good running water in my pastures. But in many summer hog pastures there are no trees. and shade must be provided by artificial means. Most any kind of shelter can be made to serve as a shade. It is very seldom desirable to provide permanent buildings for shade during hot weather, as the various pasture lots cannot be so easily reached unless they are all connected with separate lanes to the permanent house. As colony houses can be moved from one lot to another as the hogs are changed on pasture, they can be used to advantage in protecting the animals from the hot sunshine In using colony houses it is necessary to provide them with extra doors so ample ventilation may be obtained.

A simple and inexpensive style of shelter can be provided by the temporary use of burlap. Old bags in which feed is purchased can be sewed together and nailed to strips of board fastened to posts or uprights. These can be taken from one lot to another and will furnish all the shade that is necessary. A framework of poles covered with straw will give satisfaction. Four rough forked posts with a few poles laid across from corner to corner and thence from pole to pole, forming a ruude set of rafters, will support the roof of straw.

Owing to the heat, a hog's system requires more water in summer than in winter It is surprising the amount that a drove of hogs will consume on a hot day. Water is essential in the proper digestion and assimilaton of the food. Since a large part of the animal body is made up of water, and a great deal is constantly given off in one form or anotherf, it is very important that te animals have all the good water they will drink. But a hog not only wants plenty of water to drink but a good supply in which to wallow during hot weather. In a pasture where there is no running stream or pond it will pay well to dig a large shallow hole and to keep it filled with water. The wallow should pe placed in the shade of trees if possible, or a temporary shed built over it.

A light, sloppy feed is safer for hogs in hot weather than a more solid ration. A big advantage of pasture is that it furnishes a laxative feed at the time of year when it is all important that the hog's bowels be in good condition. One of the effects of hot weather is to cause constipation in hogs. The excessive heat seems to throw the hog off feed more easily than it does other classes of animals. A laxative feed is the natural preventive. While my hogs are getting plenty of green food in pasture I feed them no grain except ground oats. The oats are mixed with sweet skim milk and fed morning and evening. Sour food is not wholesome, at least, old, sour skim milk is not. Buttermilk, if fed while fresh and cool, is a wholesome food.

The importance of keeping hogs free from worms should not be overlooked. Worms are a great curse to the swine-growing business. Usually where one hog of the drove is found to have worms it is a safe wager that they all have, for the eggs of the worms pasing out in the manure from the diseased hogs develop into larvae and are taken into the systems of other hogs as the yroot about in the yard or gather food in the pasture. The beginner with hogs frequently does not recognize the presence of worms, and wonders why his hogs seem so unhealthy when they have so much good feed. I have tried various worm remedies, but the best I have ever used is lye. This is an extremely concentrated product, and should be used with care. I thoroughly mix it with swill, so that each animal gets only his proportionate share. A heaping tablespoonful to a barrel of swill will clean out the worms and does not injure the hogs. It can be fed once every day for a week or so, and then not given for a month or more when it may again be fed for a few days. My experience has proven to me that this feeding at intervals will rfee the hogs of worms and keep them free. Another good remedy for worms os copperas. A little of this mixed in the swill and fed for a few mornings in succession usually gives satisfactory results.

It's a money-saver—
this book we send you free

It's no exaggeration to call this book—

"What the Farmer can do with Concrete"—

a money-saver. It makes money by saving money—for every farmer who reads it and who acts on the advice and instructions it contains. How does it save money ? Simply by telling how to build farm improvement of Concrete.

The farmer nowadays realizes that he is under a terrible handicap in his efforts to make money, if he has to be constantly sinking profits in repairs. Only by using Concrete can he have buildings that do not call for repairs and painting. Only with Concrete for his building material can he have his farm fireproof, waterproof, watertight, repair proof, vermin proof and sanitary.

In our 100-page book, there are directions which enable the farmer to construct all sorts of improvements of Concrete, in odd times—with the help of his man. Send for this remarkably useful, money-saving book. Mark on the coupon the subjects which are of immediate interest to you.

By building Roads of Concrete we can reduce the cost of living, and at the same time increase the farmer's profits on everything he sells or buys.

The welfare of the farm demands **Permanent Highways of Concrete.** Our farmers need them for the hauling of garden-truck, fruits and dairy products into town. On Concrete alone can this hauling be done economically. It provides the only surface that resists the wear and tear of modern traffic. Concrete is, in fact, as necessary to successful road building as it is for successful farm construction. Concrete roads, like Concrete buildings, pay for themselves in the saving of repairs.

HAY FOR WINTERING EWES

Sheep can be successfully wintered with a smaller use of grain than is needed for other live stock. If in good condition at the beginning of winter and given the right kind of hay they can be caried through the winter without grain unless the lambs are to be dropped before going to pasture. Alldepends upon the kind of hay or roughage used, advises the United State Department of Agriculture.

Legume hays stand at the forefront as roughage for sheep. No other roughages approach them in feeding values. The coarse-stemmed hays, like timothy, red top and blue grass, have very few leaves, an, therefore, are poor sheep feeds Hays having a large amount of timber in them also are undiserable. Not only is timothy unpalatable to the sheep but it causes serious cases of constipation. The dry timothy heads work into the wool, causing irritation to the skin, lessening the value of the clip, and making shearing difficult. When timothy or other coarse-stemmed hay is fed to sheep in winter quarters, it becomes necesary to use supplementary feed to keep the sheep in condition.

If any nonlegume hay is fed, supplementary protein feed is needed. Linseed meal is good, since in adition to furnishing protein, it counteracts the constipation effect of timothy hay. From one-quarter to one-half pound of linseed meal per ewe daily should be used, depending upon the size and condition of the animal and the other feed used.

In an experiment conducted at the Missouri station and reported in Bulletin No. 120, the relative values of clover and timothy hays for wintering ewes were determined.

Fifteen ewes fed 2.9 lbs. timothy hay and 0.35 lb. grain uer head daily lost 7.6 lbs. each during the same time that anotser lot receiving the same weight of grain and clover hay gained 6.5 lbs. The 14 ewes fed clover hay dropped 16 strong lambs, while those fed timothy dropped 11 strong and five wee klambs. The lambs from the ewes fed clover hay gained more rapidly during the first 30 days than did those form the ewes fed timothy hay.

"Would you kindly tell me what to do to rid horses of pinworms? I have tried a good many treatments but none seems to have any effect.—J.L.C.

These worms inhabit the rectum. Inject into the rectum a gallon or two of warm, soapy water. When this, with the faeces that were present have been expelled, inject 1 oz. of oil of turpentine mixed with a quart of new linseed oil.

The Perfect Light for Farm Homes

—SOLD ON APPROVAL

The construction of this lamp is perfect. The light does not waver, it is steady as the sun and the nearest approach to daylight that science has discovered. Fine to work or read by, colors can be so distinguished by this light that it is possible to do even the finest needle work under its rays. TAKE CARE OF YOUR EYES, MONEY CANNOT REPLACE THEM. BY INSTALLING OUR LAMPS, THE EYE STRAIN WILL BE RELIEVED AND YOU WILL FIND LIFE A PLEASURE. Remember we sell the lamps on approval and you are the judge and jury Certainly we could not do that if they were not what we claim, so don't hesitate. Send for particulars—NOW —TODAY.

WHEN HENS EAT EGGS GET AFTER FAT BIRDS

...ou-
...ng.
...t most
...indications of a possible broken and eaten egg in your flock, get busy, try to trap the hen that lays the soft shell egg, not the one that eats it.

All up-to-date breeders have a separate pen for fat hens. There are always a few hens in a flock as a rule that will take to fat, even of the same variety, same age and on the same feed. These fat hens must be culled themselves. They are the ones that start your trouble. If unable to catch them onthe nest, go over them at night, while on their perch. Take one at a time and go over them carefully. You can't help but find the fat ones.

The first thing to do after separating the overly fat ones from the remainder of the flock, is to place them in a stall that is sufficiently large to afford plenty of exercise and light.

The floor should be covered with clean, dry litter to the depth of ten to twelve inches. Theis grain should be fed in this litter. It should consist of half wheat, the other half oats and buckwheat equal parts, fed in the litter in the morning; regulate quantity acording to the number of hens you have, or about two ounces per head per day.

Noon meal should consist of green food, sprouted oats, or vegetables shredded. Have bran before them at all times, also grit, shell and charcoal. Twice a week for two weeks add one tablespoonful of Epsom salts to each quart of water you place before them. Dissolve the salts the night before in a cup of water. Throw a few oyster shells on the floor every day in addition to what you feed in the fodder. Cut the corn out during this treatment. Try to reduce the fat. As soon as the weather permits put them back in their regular pens and let them get outside. Make them work all you possibly can for what feed they get, and I will assure you that the hens will lay good, hard shelled eggs, and plenty of them. The egg eaters have now disappeared.

Some of our big breeders cull out all birds inclined to flesh up easy and prepare them for market. As a rule they will never lay very many eggs at their best.

In cases where hens have been neglected and egg eating has been going on for some time, and where the whole flock has formed the habit, there is but one course to take. Darken your nests and keep the hens busy digging for something to eat. Feed little and often in litter, and as soon as weather will permit, let them go outside. Soon they will forget.

The experienced poultryman is seldom bothered in this direction, as he is on the lookout constantly.

A stitch in time is worth nine, and eggs are to expensive for hens to eat.

Veterinary Editor, — "Would you tell me something that will cure ringworm on calves? I had some calves that had it last year, and they have it yet. I have used castor oil and machine oil, and I also got something from a veterinary surgeon but it did not help it any. Please advise me what to do.—A. E. Stratford."

Isolate the affected and be careful to not carry the infection (which is a vegetable parasite) to healthy animals on hands, clothing, etc., Moisten the scales with sweet oil, remove them and then apply tincture of iodine twice daily until cured. An ointment made of four drams white helebore mxed with 2 ounces vaselin may be used instead of the iodine.

APPLE SPRAYING

By G. E. Sanders, Field Officer in Charge
Dominion Entomological Laboratory
Annapolis Royal, N. S.

Mr. President and Gentlemen: It gives me more pleasure than ever before to have the privilege of addressing this, your annual meeting of 1918; first because we obtained during the season of 9117 more interesting and more instructive results from our experiments than we have ever before been able to obtain in a single season and which we will endeavor to put before you today, and second because you have been able to dispose of your fruit at prices which a year ago when I was traveling about the Valley holding meetings in the interests of "more sprayin" would have sounded to you like the figures of a Victory loan or a National debt, than apple prices.

The apple growers of the Annopolis Valley are to be congratulated not only on their success of the past year but in the confidence they have shown in their one big industry and their determination not to neglect what Prin. Cumming terms their big permanent asset, their apple orchards, even if the outlook for prices is dark and many men who should know better advise not spraying. The growers of the Annapolis Valley know that neglecting the orchard in most years means the loss of the next years crop and they intend to finish the war with their orchards in good condition and ready to supply the markets that nature and geography intend them to supply. I say this not because I hear it spoken, I do not hear it spoken, but I see it acted and actions speak louder than words. For the past three years there ahs been an uninterrupted increase in the amount of spraying material used and that is all that is required to gauge the faith of growers in their industry. For three years pessimists have told us during the winter and spring that "Apples would not be worth picking next afll." As fall and winter have approached each year their theories have been disproved. In 1915 we got good prices and in 1916 and 1917 record prices for our fruit.

I cannot leave this subject without refering to President F. A. Chipman's address and its two portions of true prophecy in this meeting one year ago. He said, "Just now let me say that black spot or apple scab never was so prevalent in Ontario as in 1916. Many of the Ontario orchards were almost defoliated in August and September, owing to scab infecting the leaves, I leave it to you gentlemen to guess the effect of that on the Ontario crop of 1917 and to judge the extent to which Ontario apples will compete with our apples in 1917-18." Again he said, "As fruit growers studying the economical growing and marketing of our fruit we are in very much the same position as last year and we may, I think, with profit ask ourselves the same question as the successful optimist of last season asked himself, 'Can we afford to neglect our orchards even if we get nothing for our crop this year.' " I think gentlemen, that we can very well consider these remarks of the ex-President, made one year ago, when deciding on our orchard procedure of 1918. They show us that neglect is apt to react and spoil the crop of the following year, for we are supplying Ontario apple towns with their apples this year, and that we cannot be sure of a failure even if all signs do point towards low prices.

Spraying Work for 1917

Last year I came before you in this meeting and told you that lime and sulphur used as a fourth or last summer spray was causing the loss of a great deal of fruit in Nova Scotia and recommended that you change for that one spray to Bordeaux. I advocated the reduction in strength of the lime and sulphur for the after the blossom spray and the substituting of arsenate of lime for arsenate of lead, because it is not only a little safer on the foilage but it is much cheaper. We advised testing soluble sulphur and arsenate of lime for the first spray and the use of 15 lbs. of paste lead arsenate to 100 gallons of water, straight asma preblossom spray for orchards that were badly infested with canker worm, relying on the excesive amount of lead arsenate as being an efficient fungicide. We knew that in many respects the old standard recommendations for lime and sulphur did not apply to Nova Scotia conditions, but where and to what extent we could dilute lime and sulphur and still have it an efficient fungicide we did not know. We recommended these changes in the interests of safety and although we can see where we can improve on our recommendations for 1917 we are satisfied that the weakening of the lime sulphur, the substituting of arsenate of lime for arsenate of lead and the using of Bordeaux for the last summer spray has saved thousands of barrels of apples that would have been caused to drop had the old strength of lime and sulphur and arsenate of lead been used. In this regard we cannot say absolutely that no harm has resulted where the solution recommended were used. This was partly due to ours being the only Government staff in America in 1916-17 recognizing injury and loss of fruit from the use of lime sulphur. We did not know just how far to go in recommending the weakening of the lime sulphur solution nor did we anticipate the spray gun and the worst season of spray injury since lime and sulphur were first used.

During 1913 and 1914 we used lime and sulphur from 1-35 to 1-40 with excellent results, only an occcasional man complaining of burning or spraying his apples off the trees. In 1915 this complaint became very general and in that year it was demonstrated in the orchard of Mr. G. L. Thomas as well as in two of our own experimental orchards that lime and sulphur used for the fourth spray would cause the apples to drop and that Bordeaux and soluble sulphur (a sodium sulphide) wouuld not cause the same drop even if more leaves were apparently burned by the soluble sulphur than by the lime and sulphur. n 1916 we found that lime and sulphur 1-43, and stronger, with arsenate of ilme 1-37½ with arsenate of lead would cause serious dropping of the fruit and that weaker solutions, down to 1-75 would cause some, but apaprently not serious, injury.

How Lime Sulphur Injures the Apple

Our first work in 1917 was to find out how lime sulphur caused injury and dropping of fruit, whether it was the spray burning the fruit, the stems of the sets or the leaves. About a week after the blossoms fell we took a hand atomizer and sprayed 1-30 lime and sulphur on all of the apples and stems of the apples on a Gravenstein limb. On another limb we sprayed the leaves only with the same solution taking care not to to touch the fruit. Where we sprayed the fruit no harm resulted but where we sprayed the leaves all of the fruit dropped. About this time Mr. S. B. Chute sent two men out to spray with the new spray guns. One man spraying from the ground up through the trees did serious damage to the foligge, while the other man caused no injury. We immediately tested this out in the laboratory and found that we could wet the upper side, only, of apple leaves with 1-30 lime sulphur solution and no injury would result but where we wet the under side of the leaf with the same solution we got very severe burning and usually dropping of the leaves. Spraying with soluble sulphur and Bordeaux on the under side of the leaf apparently caused no more harm than the same solution applied to the upper side. It was found that the burning following the application of lime sulphur to the under side of the leaf appeared on the upper side which was untouched by the spray instead of on the under side where the spray was applied. About this time we extracted some of the chlorophyll or green coloring matter from the leaves an tested it out by pouring lime sulphur into one bottle of chlorophyll solution, soluble sulphur into another and Bordeaux into another. The lime sulphur caused a sudden change in the green solution, throwing down a brown percipitate, the soluble sulphur and Bordeaux caused no marked change. The next move was to section some leaves, the under side of which had been sprayed with each of the three solutions. It was found on sectioning the leaves and putting them under a microscope that the lime sulphur was being absorbed by the leaves and causing a marked change and browning of the chlorophyll in the palisade tissues, the soluble sulphur and Bordeaux caused no apparent change in the chlorophyll contained in the cells of the leaves.

It must be understood that the chlorophyll of the leaves is the medium through which plant food is gathered from the air and manufactured into sugar, starch, cellulose, etc. Practically all of the combustible portion of the plant comes from the air and only the ash and water comes from the roots, so you see that the chlorophyll of the leaf is infinitely more important than the roots in gathering food for the plant. The chlorophyll is mostly stored in the upper or palisade c ells of the leaf and it is for this reason that the spray applied to the under side of the leaf appeared to injure the upper side first. The upper side of the leaf is covered by an impervious coat of waxy coated cells through which the lime sulphur could not pass. The under side of the leaves is covered by a coat of thin walled cells bearing small hairs and contains numerous openings or stomata in through which the carbon dioxide gas is taken to be manufactured by the chlorophyll into sugar, starch, etc., so we can see how much easier it is for a leaf to absorb from the under than from the upper side. This in turn shows us why spraying down with lime and sulphur does no damage, while spraying up with the same solution will either temporarily or permanently injure the chlorophyll and cause the fruit to drop.

Methods of the Application of the Spray Affecting Lime Sulphur Injury

There is no doubt that the increase in the size, pressure and nozzle capacity of the power spraying outfits have been in a great measure the cause of the increased amount of burning in recent years, the high pressure having a tendency to wet the under side of the leaf more thoroughly. The spray gun introduced in 1917 while it is in my mind the very finest thing yet invented for applying spray, has been the cause of an immense amount of injury during the past season as practically all of the operators used it from the ground, many standing near the butt of the tree and spraying up in all directions, wetting the under side of the leaves more thoroughly than the upper side. This procedure with lime and sulphur has invariably resulted in very severe burning, with soluble sulphur and Bordeaux no appreciable injury resulted. In using the spray gun, or any nozzle, for that matter with lime and sulphur spray so as to wet only the upper side of the

leaves on the second, third and fourth sprays or injury will result.

We found in 1917 that the directoin in which the spray was applied was more important than the strength of the solution. We found that lime sulphur 1.005 sp. gr., or 1-60 could remove practically all of the fruit when applied in all directions as a fourth spray. In one orchard where we sprayed with three different kinds of Bordeaux as fourth sprays the trees averaged over 150 apples each but hwere 1.005 sp. gr., limen and sulphur was used at the same period the trees gave only 6 apples.

On the other hand we have evidence in many orchards, particularly Mr. J. Howe Cox's orchard in Cambridge, that the old strengths of lime, hulphur, that is 1 to 35 and 1 to 43, can be used htroughout the season and applied with a spray gun and no damage of loss of crop result. Mr. Cox had his men hold the gun a long way off from the trees and sprayed so that the upper and not the lower side of the leaves received the spray.

Periods at Which Lime Sulphur is Dangerous

We have corroborated our previous finding that the greatest damage from lime and sulphur comes from the fourth spray but we have found that it will also reduce the crop materially as a second or third spray. The following table gives the results.

No. of apples per Wagner tree. Only one spray apples to each plot. Lime Sulphur plots 12 trees each, Soluble Sulphur and Bordeaux Plots 16 trees each.

	Lime sulp. 1917 spray calendar	Soluble sulphur 1-40	Bordeaux 4-4-40
Spray 1	152.66	121	87
Spray 2	40.33	61.25	62
Spray 3	28.66	43.75	55.75
Spray 4	8	74	77.5

These figures show that no period do soluble sulphur and Bordeaux do appreciable injury in removing the fruit while lime sulphur after the first spray begins to reduce the crop, doing its greatest harm as a fourth spray. It is important to note that lime sulphur used as a first spray did not cause any reduotion in the crop.

Effect of Light on Lime Sulphar

Our attention was called by Mr. B. G. Pratt of New York to the work of Dr. Stone of the Mass. Agricultural College in regard to the effect of sunlight in causing plants to resist spray injury. It was found that plants kept for a period in darkness would burn more readily than those in full sunlight. We tested this point out with apple seedlings and found that plants kept in a dark room for a week and then sprayed and placed in full sunlight would burn very badly with lime sulphur and only slightly with soluble sulphur. In the same way plants kept in a half lighted cellar would burn badly with lime and sulphur but not at all with solubls sulphur and Bordeaux. Plants kept in full strength sunlight did not burn with any one of the three sprays applied.

Chlorophyll is not manufactured in the absence of sunlight and after a period of drakness the chlorophyll is depleted so the injury resulting from spray acting upon a portion of it is more serious than after a epriod of bright sunshine. An instance of the effect of sunlight on the green color or chlorophyll is the potato sprout which in darkness is pale but on being brought to the light turns green or under the influence of sunlight manufactures chlorophyll.

During the summer Mr. F. H. Johnson of Brigdetown noticed that the north and inside of the tree showed the most spray injury and asked in regard to it but we could not then explain the cause. In going over the country we constantly heard that lime sulphur must be different from what it was when it was first brought out as it did not cause injury years ago. After following up several lines of enquiry including the analysis of lime sulphur over the whole period we decided to look up the sunshine records which are here given.

Number of hours of bright sunshine for the months of May, June and July for 5 years.

	1913	1914	1915	1916	1917
May	194	192.6	173.5	214.	122.4
June	271	256.6	199.6	180.1	187.2
July	256	249.2	220.4	217.8	199.6
Total	721	707.4	623.5	611.9	509.2

These figures show about 100 hours less sunshine in the three months of 1915 and 1916 than in the same period of 1913 and 1914. In 1917 we had 100 hours less sunshine during the three months than we had in 1916 and 1915 and 200 hours less than the corresponding periods in 1914 and 1913. We know that we first got serious injury from lime and sulphur in 1915 and that we had about the same amount of injury in 1916 and that in 1917 we have had more injury from lime and sulphur than we have had in any previous year. We know that lime sulphur injury is an injury to the chlorophyll and that the amount of chlorophyll in a leaf and its resistance to lime sulphur injury is a question of sunlight so we have the abnomal amount of injury from lime sulphur in 1917 explained. This also explains the excessive burning on the north side and in the middle of the trees. We may have in 1918 a bright sunny season with little or no lime sulphur injury.

Fungicidal Value of Some of the Sprays

Although we have often heard the statement that "lime sulphur and Bordeaux are of equal value in the control fo apple scab" we have made observations on the fungicidal value of hte various solutions incidental to our other work which goes to disprove the statement.

In our Wagner plots the following percentage of apple scab was found. Only one spray being applied to each plot.

	Lime sul. 1917 calendar	Soluble 1 bl. to 40	Bordeaux 4-4-40
1st spray	21.	17.2	9.4
2nd spray	32.5	23.	4.6
3rd spray	16.5	17.5	5.4
4th spray	43.3	9.8	24.5

The difference being all in favor of Bordeaux until scab infection, which took place just after the third spray. The fourth spray was of course valueless and no deductions can be drawn fro mit.

Percentage of Pit in the Same Plot

	Lime sulphur	Soluble sulphur	Bordeaux
spray 1	17.9	19.2	8.2
Spray 2	26.9	14.3	1.
Spray 3	4.2	28.7	2.4
Spray 4	16.6	1.5	.6

In the control of pit the difference is in favor of Bordeaux throughout.

In New Brunswick in co-operation with Mr. A. G. Turney, Provincial Horticulturist and Mr. G. C. Cunningham of the Dominion Division of Botany, we got data which proved Mr. Turney's statement that lime sulphur alone will not control apple scab on McIntosh in a bad year in Fredericton. But we found that where the lime sulphur inc ommon with all of the other sulphides failed that we could control applescab on McIntosh in the same orchard with Bordeaux. While there is but little difference between the value of the two in an when put to the most extreme tests the Bordeaux proves itself superior as a fungicide.

Percentage of Inkspot in Crimson Beauty

Sprayed July 14th. Picked Aug. 21st. Placed in storage for 39 days.

Lime sulphur 1.005 sp. gr. or 1 to 60 27 per cent. Inkspot.

Bordeaux 7-7-100 No Inkspot.

This shows one of hte reasons why apples sprayed with Bordeaux, provided they are not seriously russeted will keep so much better than those sprayed with lime and sulphur. Our observations and count of apples as well as the statements of warehouse managers go to show that Bordeaux has a marked effect o ncontrolling storage scald or bronzing while lime and sulphur is of little or no use in this regard.

In regard to russeting of the fruit from the ues of Bordeaux, we told you last year that Bordeaux used as a fourth spray would cause no appreciable russeting. In 1917 we got the following results on Wagner.

Percentage of Russeting 4-4-40 Bordeaux

First spray—12.6—very slight.
Second spray—61.5—mostl slight.
Third spray—69.7—moderate to bad
Fourth spray—1.4—very slight.

In one case a block of Banks Red Gravensteins was sprayed with 4-4-40 Bordeaux 12 days after the blossoms fell and practically no russetting resulted. The Thomson-Bushanan Bordeaux made 2 lbs. bluestone, 10 lbs. of lime to 40 gallons of watetr used throughout the season gave only slight russetting and if used for the two sprays before the blossoms and one two weeks after would give very slight russetting indeed. Any Bordeaux used immediately after the blossome will ,in addition to russetting, pale the fruit or prevent it from coloring, this results to a lesser extent from using Bordeaux immediately before blossom.

Bordeaux Bronzing

Leaf injury or bronzing from Bordeaux seems to be cumulative. One spraying of 4-4-40 Bordeaux will not cause bronzing but when used three or four times on the same tree it will cause serious bronzing, yellowing and defoliation. The Thomson-Buchanan Bordeaux mads up of two pounds of bluestone and ten pounds of hydrated lime to 40 gallons of water has not caused leaf injury even when used four times in one season. I look for a great increase in the amount of Thomson-Buchanan Bordeaux to be used for the first, second and fourth sprays the coming year. That the material will control fungus and give a crop has been amply demonstrated by Mr. John Buchanan of Berwick during the past two years.

A Method of Preparing Bordeaux Quickly

We have this year prevailed upon the United Fruit Companies to have a stock of bluestone pulverized to pass a screen of 20 meshes to the inch made for them. By the use of this material and hydrated lime it will be possible to make the mixing of Bordeaux with power outfits as easy as the drawing of lime sulphur from the cask.

In using this material weigh out the quantity of bluestone and put it into the empty tank. Start the engine and agitator and fill the tank. It will take from five to fifteen minutes to fill the tank but the bluestone will dissolve in less than one minute. When the tank is nearly full, add the hydrated lime, always using an excess of lime, when the tank is full the spray is ready to apply.

The powdered bluestone costs about 2 cents more per pound than the crystals and the difference in price may or may not be paid for, in time; that depends on the time the grower has to spare in the spraying season.

Sodium Sulphide

(Soluble sulphur, Sulfocide, Spra sulphur)

Last year we advised the testing of soluble sulphur with arsenate of lime for one spray only and many used it for their first spray with good success. We have found that soluble sulphur 1 lb., hydated lime 10 lbs., and arsenate of lime ½ lb. to 40 gals, the three being added in the order named, may be used four times on the most tender foilage without injury. For those who are inclined to experiment we would recommend this for the third spray only. It would seem desirable in experimenting to try on a small plot, say one tank for each spray.

First spray—3-10-40 Bordeaux.
Second spray—2-10-40 Bordeaux.
Third spray—Soluble sulphur 1 lb. or Sulfocide 1 qt., Lime 10 lbs., Arsenate of lime ½ lb. to 40 gallons.
Fourth spray—310-40 Bordeaux.

This programme may have defects and we would only recommend it in an experimental way where one is anxious to eliminate lime and sulphur from the programme.

Poisons

In 1917 as in previous years we have found that arsenate of lime is slightly safer than arsenate of lead with lime sulphur and it costs only about one half as much per content of arsenic. With soluble sulphur, arsenate of lime is the only poison that can be used. With Bordeaux arsenate of lime is satisfactory and cheap. Arsenate of lead is no better insect killer with Bordeaux but in 1917 the Bordeaux arsenate of lead combination gave slightly better scab control. Personally I would favor for this season some of the finest grades of arsenate of lime for use with Bordeaux on account of their low cost as compared with arsenate of lead.

Insect Outbreaks

The outbreak of canker worm is still going strong and in many of the infested orchards tree tanglefoot has not been applied. The only means now of preventing defoliation in such orchards is to spray very thoroughly just before the blossoms open with 15 lbs. of paste lead arsenate to 100 gals. of water. We advocatet paste over the powder for this purpose. On the whole we have found arsenate of lead, 15 lbs. to 100 gals., about as valuable in the control of apple scab as lime sulphur, in a rainy season it si somewhat more valuable, in an ordinary season of about the same value.

The Tussock moth did serious damage in 1917 by eating the fruit and in 1918 will undoubtedly be more abundant than in 1917. We found in 1917 that the third spray killed more tussock moths than the fourth, although the larvae emerge only a few days before the fourth spray is applied. The Tussock moth is very easily detected in the orchard at the present time, the egg masses being very conspicuous, 100 to 150 eggs in a mass either naged or covered with a white froth and attached to one or two dead leaves anywhere on the limbs or twigs of the apple or other deciduous trees. Where Tussocks are present we would advocate the addition of poison to the third or after the blossom spray and where there is a very serious outbreak we would advocate the use of 15 lbs. of paste lead arsenate to 100 gals. of water for the third or codlin moth spray.

Saving Effected by Co-operation

I need hardly remind you of the savnig that has been affected by the United Fruit Companies in the purchase of poisons this season. After having gone over the whole situation I find that arsenate of lime will sell in Nova Scotia from 11 to 14 cents less per pound than in Ontario and Quebec and paste arsenate of lead will sell from 4 to 7 cents less per pound in Nova Scotia than in the above mentioned Provinces. You are all benefiting to a greater or less extent by these prices which were brought about solely by the immense buying power and economical distributing machinery of the United Fruit Companies. By getting their poisons so cheaply as compared with other districts the Nova Scotian growers can afford to use relatively more of them with consequent benefit to their orchards.

The Nova Scotia Farmers Association

The twenty-second annual convention of the Nova Scotia Farmers' Association was held in the Court House, Truro, on January 22nd to 24th. The attendance was not so large as at some previous meetings but the whole province was well represented by about three score of her most intelligent farmers who had come together to listen to the valuable addresses prepared for them by our foremost agricultural propagandists with a view to glean the choicest morsels and rehearse them to their respective Agricultural Societies and kindred associations. These former delegates also had another object in view; viz., the discussion of problems confronting their respective communities and to formulate memorials to the government and other sources that can give redress.

President Murray occupied the chair and in his customary racy and entertaining fashion, kept the convention in good fettle for work.

His Worship Mayor Dunbar welcomed the delegates to Truro, after which the president read his address.

A communication from Dr. Jas. W. Robertson re Agricultural Rerief to the Allies was read and placed in the hands of a committee to suggest action. As a result a fund was opened for subscription and the sum of $56.00 was realized before the convention closed.

One of the main features of the evening's programme was an excellent address by Prof. J. M. Trueman on "Law and Superstition," in which he dealt with many of the essential features of successful stock raising.

The Wednesday morning program included the reports of Directors, Exhibition Commissioners and Supt. of Agricultral Societies, and an excellent talk on Stallion Enrollment and Inspection by Dr. J. A. Sinclair, V. S., in the course of which he pointed out some very potent results that surely follow in the train of breeding to only quality sires.

The Wednesday afternoon session was held at the Agricultural College. In the Science Building Prof. W. H. Brittain gave a practical talk on "Spraying,, dealing particularly with potato spraying from the standpoint of "what we are spraying for" and "what shall we spray with, "Time of Application, Rate of Application and combinations to use in combating fungus and insect pests of the potato."

The Bordeaux mixture 4-4-40 was the main spray advocated for blight with arsenate of lime added as the cheapest insecticide that can be procured this year.

Prof. Britain advised the farmers to urge upon their friends the necessity of procuring their supplies early in order to avoid the possibility of not being able to procure supplies later.

Following Prof. Britain's address the delegates visited the basement of the Main College Building where they inspected various makes of sprays and other lines of farm machinery.

During the latter part of the afternoon a live stock demonstration was given in the pavilion where Prof. Trueman and Dr. Sinclair conducted discussions on the merits of the splendid specimens of the bovine and equine species exhibited in the ring.

During the Wednesday evening session Prof. L. C. Harlow gave an excellent talk on "The Fertilizer Situation" and strongly urged the necessity of procuring supplies without delay.

Prof. W. Saxby Blair read an instructive paper on "The Place of Agricultural Associations in Greater Production." This paper will be published in full in the next issue of the Maritime Farmer and in accordance with a vote of the Association it will be published in phamphlet form for distribution to Agricultural Societies.

Col. Blair, one of the fathers of the Association was present, and invited to address the meeting. Despite his advanced years, Col. Blair's mind is still keen and clear. He lead his audience back through the life history of the Association and rehearsed many condtions that existed when he was a boy over seventy years ago to instance what may be accomplished in trying times. Col. Blair is strongly in favor of every movement that tends to be prepared for future possibilities in the food supply situation.

The reports of the Legislative Committee and the County Farmers' Association were also received at the evening session.

The Sheep Protection resolution which was passed at last year's convention and which had been turned down by the Legislature was ratified and ordered to be again presented at the next session of the Provincial Legislature.

The election of officers took place on Thursday morning and resulted as follows:

President—Samuel Freeman, Amherst.

Vice-President — D. R. Nicholson, Coxheath.

2nd Vice-President—Walter Churchill, Yarmouth.

Directors—E. J. Johnson, George's River; J. Howe Cox, Middleton; Johnson Cameron, Stellarton; A. N. Griffin, New Minas; Wallace Rhodenizer, Bridgewater.

Auditors—Professors Landry and Trueman, N. S. A. C., Truro.

Legislative Committee — Wm. O'Brien,Windsor and S. A. Logan, Amherst.

Exhibition Committee—F. W. Foster, Kingston and H. S. Kennedy, Stellarton, re-elected.

RESOLUTIONS

The following resolution were discussed and adopted:

Whereas the demand for wood for fuel and other domestic purposes is increasing and whereas the supply is diminishing at an alarming rate.

Therefore resolved that the Nova Scotia Farmers' Association in Annual Session at Truro, do hereby request the Hon. Commissioner of Crown Lands for the Province of Nova Scotia to have prepared and distributed a pamphlet on the conservation of wood lots containing information that would be most suitable for conditions in this province.

Moved by A. Hector Cutten; seconded by H. S. Kennedy.—Carried.

* * *

Whereas we as an Association recognize the necessity of grading potatoes for market, as is necessary for apples, and

Whereas, at present many potatoes are put on the market which should be fed on the farm, and

Whereas the United States have recently adopted a similar law and all our potatoes shipped to the West Indies will come in competition with graded potatoes,

Therefore resolved that we ask for legislation requiring potatoes to be graded similar to the United States law.

Moved by J. H. Cox;! seconded by Wallace Rhodenizer.—Carried.

* * *

Whereas owing to the great increase during the past few years in the number of Agricultural Societies the present grant of $15,000 to the Agricultural Societies of the whole province gives a very small grant to each individual society when distributed.

Therefore resolved that the N. S. F. A. in convention at Truro, composed largely of delegates from the Agricultural Societies of the province urges the Provincial Government to increase the present grant to $20,000.

Moved by J. H. McIntosh; seconded by Wallace Rhodenizer.—Carried.

* * *

n view of the agitation in favor of the Daylight Saving scheme for the coming summer by the cities and towns of Nova Scotia and whereas if this scheme is adopted and made compulsory on the farmers of Nova Scotia it will work a great injury and injustice on an already over-burdened class from scarcity and quality of farm labor available.

Therefore resolved that the Nova Scotia Farmers' Association in Annual Session assembled at Truro, place themselves on record as opposed to such a scheme as far as the farming class is concerned.

Moved by A. Hector Cutten; seconded by Stanley A. Logan.

* * *

Whereas the increase in freight rates to take effect soon will make it more difficult than ever for the farmer to produce inasmuch as the extra freight is paid on his products and comes out of his pocket,

Therefore resolved that we as members of the N. S. F. A. assembled at Truro, urge the Federal Government to nationalize the railroads of Canada with a view to reducing expenses and tariffs.

Moved by J. H. Cox; seconded by A. N. Griffin.—Carried.

* * *

Resolved that we the members of N. S. F. A. in sesion asembled realize that the time has arrived when Agricultural Societies who change from one breed to another without consulting the Department of Agriculture should suffer a penalty of losing their claim to their share of the grant for the aid of Agriculture.

Further resolved that the Government be asked to amend the Agricultural Act to embody this idea.

Moved by R. M. Jackson; seconded by Wm. O'Brien.—Carried.

Whereas the Food Controller has urged upon the farmers to produce all the food possible and whereas the farmers of Nova Scotia are desiious of doing the same, and

Whereas more feed will be required to finish the beef and pork at present on hand,

Therefore be it resolved that the Nova Scotia Farmers' Association here assembled do memoralize the Honourable Food Controller that he do not permit either mills, manufacturers or dealers to hold such mill feed in stock that may be required for feeding purposes, in order to enable our farmers to finish their beef and pork and not compel them to put their products on the market in an unfinished order.

Moved by S. A. Logan; seconded by Samuel Freeman.

* * *

The Nova Scotia Farmers' Association asembled at Truro realizing that a very radical change is being made in the laws respecting Public Highways also in construction and maintenance of same,

And whereas a commision has been appointed to known as the Highway Board, such Board to take all monies collected from all sources, also to have disbursement of same with power to appoint superintendents and surveyors in each respective County,

Therefore resolved that this Nova Scotia Farmers' Association urge upon the Highway Board the necessity of appointing efficient men irrespective of their political affiliations and that special consideration be given to the appointing of patrol men for the roads who shall be required to go over their respective roads at frequent intervals and make the necessary minor

THE WHEAT PRODUCTION CAMPAIGN

The call has gone forth that it is absolutely necessary that each and every farmer in the Maritime Provinces produce as much wheat as they can during the coming season in order that there may be a greater surplus left for shipment from the grain fields of the West to our soldier boys in the trenches. The easily available surplus of wheat in the wheat producing countries of the world is far short of the requirements of England and her Allies and so every effort should be made to comply with the request of the urgent call that has been sent out by the men who have to do with the garnering of adequate food supplies for our soldier boys.

In New Brunswick the County Councils are preparing to co-operate with the provincial Department of Agriculture in ascertaining requirements, financing and distribution of the seed wheat that must necessarily be imported if adequate supplies of seed grain are to be within the reach of farmers who will do their bit by responding to the call.

At the time of writing nearly every municipality in the province adopted the plan outlined by the Department of Agriculture viz., the Department of Agriculture will locate and purchase the necessary suppplies which will be held in storage until the early spring when the grain will be shipped, sight draft attached to Bill of Lading, to the Municipal Councils of the respectivee Counties co-aperating. In the meantime the County Councillors will ascertain the requirements of their respective parishes and will place their orders through a contract committee that will keep in close touch with the Department of Agriculture.

To the farmers of New Brunswick we would say secure your seed wheat in your own vicinity if you can. If you fail in this do not delay; place your order in the hands of your Municipal Councillor and your needs will be attended to.

The wheat will be sold for cash or bankable note. Now is the time to place your order. Do it today.

HOPE OF AGRICULTURE LIES IN CO-OPERATION

I maintain the very strongest belief that through the work of the Commission of Conservation illustration farms in Dundas county we shall in the course of a few years be able to point the way to permanent improvement of agricultural conditions in Ontario. The basis of all such improvement must be co-operation amongst the farmers themselves for scientific instruction in regard to the best methods of improving production. Success depends upon the appreciation by the farming community that improvements depend upon themselves, and that, given the necessary scientific aid instruction, they must themselves co-operate and carry on the work in the same manner as men engaged in any other line of business.

The unfortunate feature of farming in Ontario, and in Canada generally, has, so far, been that each additional farmer has jealously regarded himself and his farm as a unit separated from the rest of the community and to be managed without any reference to the views or interests of any other person. As a result, we have found that agriculture can only advance to a certain point. Then progress ceased, and for some years past in the Eastern provinces, agriculture has been at a standstill, if it has not retrograded.

The problem of supplying and handling farm labour, of securing proper scientfic instruction, of improving knowledge of gardening methods, of insisting on proper teaching of agriculture in the schools, of proper study and development of the stock industry as applied to the particular locality, are all questions which can only be solved by co-operation amongst the farmers themselves. Lastly, the fundamental questions of co-operative buying and co-operative selling are those which furnish the solution for the most serious difficulties with which isolated farmers have to deal. It is my hope that the full development of the idea which we are applying in the county of Dundas may have most important practical results.—Sir Clifford Sifton, before Ninth Annual Meeting of Commission of Conservation.

POINTS ABOUT FERTILIZERS

Just as munitions are required to carry on the actual fighting in the war, so have farmers to look to fertilizers to assist them in the production of food, which is the part they have to play in the struggle. The difficulty is to get what is required for while the demand for fertilizers has increased, there are not so many sources of plant food to choose from, nor is farmyard manure likely to increase in quantity or improve in quality. No matter what is wanted in these days, the chances of getting it are enhanced by placing the order early, and this rule is particularly applicable to fertilizers. Even if not wanted until the spring, the advice to buy early still holds good, provided one has a dry place to keep it in, for we are told that at Rothamsted sulphate of ammonia is regularly stored from one year to another without loss or ill-effect. In passing it may stated that there will have to be a certain amount of rationing where crops are concerned, and this on account of the limited supply of fertilizers; therefore, it is up to the farmers to apply manures most liberally on the crops that are needed the most for the

GRADING OF POTATOES TO BE DEALT WITH

The fruit and vegetable committee of the Food Controller's office is considering regulations in regard to the grading of potatoes. The regulations, if adopted, will next year remove from the market all under-sized, scabby, damaged and defective potatoes. Uniform grading by size and quality will save an enormous amount of kitchen waste, and save much freight space; the grower will get from ten per cent. to fifteen per cent. more money for his potatoes, and the consumer will be sure of the quality of those he buys.

Potato grading is compulsory in Great Britain and widely practised in the United States, where its good effects have long been recognized. The benefits arising from potato grading will be even more marked than those derived from the grading of apples.

WHERE RUST RUNS RIOT

If you have allowed the hoes, rakes, spades, scythes and other small garden and farm tools to lie about 'most anywhere, better make a resolution toward reform. It is not only hard on the tools to lie in the grass, hang on the fence or repose on top of the smokehouse, but there is often danger to children and live stock when tools are not properly cared for. If the small boy steps on a rusty rake tooth, or cuts himself on the rusty scythe, he may contract blood poisoning and lose a foot or leg. The doctor bill in such a case, is often enough to more than pay for the time spent in putting all tools in place when through with them. The fact is, it does not take much longer to put a tool in place, for usually the tool shed is near the barn or house, and you usually strike for one or the other of these places when the job is completed.

* * *

It is the plain duty of every farmer to grow more hogs in 1918.

* * *

We have found that a rich father is too often a young man's excuse for being worthless.

* * *

A good wife and health are a man's best wealth.

* * *

He who has four and spends five, has no need of a purse.

* * *

No man will ever reach heaven with his face toward the pit.

* * *

The attention of good farmers everywhere is directed toward securing good seed oats. This seed will be scarce next spring.

* * *

Our forefathers risked their all for liberty. Too many of us are jeopardizing our liberty for profits.

* * *

Loyality has been likened unto the playing of a violin. You have to get in tune before you can play.

* * *

If it is not a habit of yours to watch for new ideas—start now; stop, look and listen and you will not be run across by the engine of defeat.

* * *

There are two crops which cannot, as a rule be grown in the same parish, viz., sheep and dogs. Sheep are most profitable, but dogs are the favorites with too many farmers.

* * *

The person who does his or her best has done everything, but those who have done less than their best have done little, if anything.

* * *

Do you ever read the advertisements in your farm paper? Better do it. There may be something that you want to buy. Always mention the paper you saw the advertisement in. It is the thing to do.

The Feed Situation in 1918

Not Encouraging--Food Controller Still Does as the Big Millers Determine

The inevitable has come to pass. Hon. W. J. Hanna, who has been Food Controller of Canada for the past few months, has stepped down and out and his place is filled by Mr. H. Thompson, of Vancouver. Let it be hoped that the change is indicative that a progressive policy will be adopted in this important branch of the government service and that the personnel of the department will be so arranged that there will be some assurance that pledges given in behalf of the Food Controller will, in slight measure at least, stand some show of fulfillment.

Some months ago numerous organizations in the Maritime Provinces, the members of whom are the farmers to whom Mr. Hanna appealed for PATRIOTISM and production, decided that they wanted to buy feeds co-operatively. The flour mills of the country decided that they would not sell to farmers. It was all right for farmers to raise wheat and other products but it was quite UNUSUAL that they receive back the by-products until various intermediaries were given an opportunity to make the USUAL rake-off.

The millers, however, were not wedded to the USUAL channels in Canada. It was brought to the attention of the Maritime Farmer that these millers, one of whom at least, paid dividends of twenty-five per cent. per year, were shipping large quantities of feeds to the United States. Knowing that the feed situation in Canada would be little sort of desperate this year, the Maritime Farmer on August 18th, 1917, called the attention of Mr. Hanna to this condition and asked that exportation of these feeds be prohibited. But there was nothing doing for four months. On December 19th last an order in council was published prohibiting the export of feeds and forcing the mills to offer all mill feeds to Canadian consumers. Only once was the Food Controller able to nail down these wily gentlemen. The Maple Leaf Milling Company were caught with some bran and middlings and these were taken over by the live stock branch of the Department of Agriculture and distributed. But one lesson was sufficient and since then there have been no loose feeds. That is there is none that any farmer's organization can get a line on.

The food controller, too, in October 1917, promised definitely that farmers would get feeds. Through his chief clerk, Mr. Todd, he declared that the farmers would be looked after and that he would see that they were able to get feed at wholesale prices. Of course nothing resulted, and then another shift was made and the live stock branch of the Department of Agriculture, Ottawa, was brought on the scene and they were to do what Mr. Hanna neglected to come across with. But after one spasm, the movement died a natural death, and every provincial department which acted in good faith on the assurance of Ottawa and promised feeds in car lots, found thmselves victime of a little joke and badly stung. This was fiasco number two.

Joker number three, however, the really and truly rich one. The Food Controller discovered shortly before leaving office, or at least somebody discovered for him, that it would not be wise to force millers to do anything UNUSUAL. Business must be done as USUAL, the big millers claim. To do otherwise you see, might disturb them. It is true that things are not just AS USUAL in Europe. It is true that thousands of farmer's sons have died quite UNUSUALLY on the blood-stained battlefields of France and Flanders. It is also true that the farmers in all parts of Canada have contributed UNUSUAL sums through the Victory Loan and so forth, in order to help market the output of the flour mills of Canada. It is also true that these same farmers were asked to raise UNUSUAL crops to meet UNUSUAL conditions. They have been requested to provide an UNUSUAL amount of pork for the same reasons. But when they ask that their money be accepted in the ordinary way in payment for feeds at wholesale prices, they are told that these millers must go on as USUAL. Nothing must be done to cut the twenty-five per cent. dividend of that big flour mill. That must be as USUAL.

And so joker number three has been put over. A farmer may not buy direct. He produces the wheat but his money is no good. All that is needed of him is his labor and the produce of his farm. It would be quite lacking in professional etiquette for the mills to let him in on the ground floor. Therefore, the millers are to sell to the middlemen, who are to take the cash at the car door, and charge the farmer five cents per bag for taking the coin. Or, if the goods are charged, the farmer will pay ten cents per bag. This is USUAL. The farmer of course, wishes to pay the draft for the feed himself, unlock the car door and save the middleman's toll, but Mr. Food Controller, being convinced that this is not USUAL, will not consent to any such arrangement.

Seriously, is there or is there not an UNUSUAL condition in Canada? If things are UNUSUAL why should not the mills o this country do their share of UNUSUAL things? Are farmers to be the goats all through the little comedy, or is Mr. Thompson prepared to come over and really show that he means business and intends to really see that the big flour mills are made to sit up and take notice? Are men to be conscripted and this sort of thing to be permitted? Surely life is more sacred than miller's profits? And yet we can devise ways of securing men. Is the other problem greater?

Almost four years ago the Maritime Farmer fired the first gun for patriotism and production. This paper then realized the importance of increased production and advocated it. It has never had occasion to change its opinion, but it maintains that the millers of Canada should be forced to do their share too. There should be no discrimination. If the farmer put forth special efforts to save his country, then the miller should exert a little pressure along the same lines. This is an UNUSUAL war and to expect only one portion of the Canadian population to make sacrifices while the big flour mills pay enormous dividends is asking too much.

There has been another ludicrous side to the situation. The Food Controller has been much exercised about conservation of flour. He has declared again and again that unless those of us at home are saving on flour our Canadian army must suffer. Their very lives are at stake. Yet what does this department permit millers to do? They are allowed to make all sales of feed conditional on the buyer taking anything up to 175 barrels to the car of this most precious of all things, FLOUR. Isn't it "perfectly killing." Here are the millers forcing on the public the very commodity which the Food Controller says is one of the essentials of a successful prosecution of the war. And yet the public is asked to regard the Food Controller's branch as a useful institution in checking the consumption of FLOUR.

Mr. Thompson, the new appointee, has an opportunity to make a name for himself. The government behind him can well afford to disregard the pleas of rich milling concerns for the application of USUAL conditions. If he would have the farmer do his bit, and do that bit best, let him see to it that everybody who has money to spend gets a chance to spend it in the lowest market. The real trouble is that millers want to sell flour, the very thing which the Allies need most. Mr. Thompson's first act should be to appoint to his staff men who have the ability to handle big questions. That is what Hoover did and he is getting results in the United States. UNUSUAL conditions there are being met by UNUSUAL methods. A Canadian farmer may buy feed in the United States without the intervention of a toll taker. Isn't it about time that the same conditions were imposed in Canada?

Farmers who are uniting for increased production in the Maritime Provinces should call on the Food Controller and the Department of Agriculture at Ottawa for a square deal. It should be a fifty-fifty proposition, with the USUAL stuff eliminated.

EVEN THE BOYS GOLD-BRICKED

Food Controller Promised Feed at Cost--- There is Now a Toll of From One to Two Dollars

The Canadian Food Bulletin No 7, dated Ottawa December 29, 1917, announces that it is "PUBLISHED UNDER AUTHORITY OF THE FOOD CONTROLLER FOR THE INFORMATION OF OFFICIAL ORGANIZATIONS CO-OPERATING IN THE WORK OF FOOD CONTROL, OR OF OTHER BODIES OR INDIVIDUALS INTERESTED. THE INFORMATION PUBLISHED IS CAREFULLY PREPARED TO ENSURE ACCURACY OF ALL STATEMENTS SO THAT IT MAY BE A PERMANENT AND USEFUL RECORD OF THE WORK OF THE FOOD CONTROL ORGANIZATION IN CANADA."

This is the official pronouncement of the Food Controller on the official standing of this publication. It contains an appeal "Boys will keep Hogs" page nine. Reasons are given why BOYS should keep hogs. This is one of them, published on the same page:

THE QUESTION OF FEED

Pork Can be Produced with Profit.—Hog Feed Available.

Prof. H. Barton, of MacDonald.. Agricultural College, St. Annne de Bellevue, writes on one aspect of hog production as follows.

"Many a man will shout, 'no feed,'—'dear feed,' when the subject of pork production is mentioned. Feed is scarce and dear, but a large amount of feed that hogs can use is available. More can be found, and at prevailing prices pork can be produced with profit. On every farm an din every household there is a certain amount of waste that only the hog can make best use of. Hog feed of this character is of immense value. Shorts and middlings are to be available at cost price. They should be used for hog feeding exclusively and not for dairy cattle for which they are not most economical."

Here is a statement which the Food Controller says is "carefully prepared to ensure accuracy." Definitely and positively the boys, through the medium of Prof. H. Barton, MacDonald College, have been promised shorts and middlings at COST price. The COST PRICE we are now told cannot be enforced, because it would interfere with the USUAL business methods. Of course it is UNUSUAL for the boy to put his small capital into pigs, even on the strength of the PROMISE OF THE FOOD CONTROLLER that "SHORTS AND MIDDLINGS ARE TO BE AVAILABLE AT COST PRICE." Are we in Canada to hand to the boys of the country a gold brick? CAN OFFICIAL CANADA AFFORD TO LIE TO ITS BOYS? MOST WISE PARENTS WILL TELL YOU THAT LYING TO THE WEE TOT IS ABOUT THE POOREST PROPOSITION THAT CAN BE PUT OVER ON THE BOY. THE FFOD CONTROLLER HAS PLEDGED HIS WORD TO THE BOY. ARE THE BUSINESS INTERESTS OF THE CANADIAN FLOUR MILLS MORE IMPORTANT THAN THE CARRYING OUT OF A CONTRACT MADE WITH THOUSANDS OF CANADIAN BOYS? IT IS UP TO THE NEW FOOD CONTROLLER TO SEE THAT THE BOYS ARE NOT GOLD-BRICKED. The information given them has been ear marked "CAREFULLY PREPARED AND ACCURATE." WHAT IS THE NEW FOOD CONTROLLER GOING TO DO ABOUT IT?

Don't neglect the colts these winter days. Too often these youngsters are expected to rough it and as a result they become stunted in growth and their future usefulness is much impaired. Most of the colts on the farm get a good start during the first six months of their lives, from the fact that they get most of their feed from their dams, but after weaning time comes they are not so carefully nurtured. Then is the critical time in their lives and the time when they should be given the most careful attention. It is estimated that a well-bred colt, if properly cared for, and fed the right kind of feed during the first three years of its life, will bring from $75 to $150 more when three years old than one that has been neglected and poorly fed.

HORTICULTURE

ANNUAL MEETING OF THE N. S. FRUIT GROWERS ASSOCIATION.

The Annual Meeting of the N. S. Fruit Growers Association was held at Kentville on Jan. 25th. There was a large attendance and interest was well sustained throughout the session. The Secretary again brought together a large and varied array of talent who spoke most acceptably to eager listeners.

Perhaps the outstanding features of the programme were the addresses of President Blair and Prof. Sanders. As the address of Prof. Sanders will be published in the Maritime Farmer in full, it will only be necessary here to say that it was marked by all that thoroughness and boldness in research which characterizes all of Prof. Sander's work for the fruit growers.

Pres. Blair's address which was one of the strongest we have had from the Chair in recent years aroused considerable discussion, particularly over that part of it which endeavored to ascertain the cost to the Valley farmer of producing a barrel of apples. His estimate placed the cost of producing a barrel of apples for 1917 at $2.68, which is considerably above that which has generally been held. But taking into account interest on capital invested and increased expenses due to shortage of labor and high cost of fertilizers the Pres. Blair's estimate is not far out of the way.

Among the other subjects which came before the Association was the ever-recurring one of spraying. The process of spraying which is so vital to the success of the fruit grower in these times seems to be an art which is most difficult to acquire, consequently more and more of our best talent is each year being concentrated upon it. It is safe to say that while a few of our growers are becoming discouraged over their lack of success in spraying, yet as a result of the work of Professors Sanders and Britain some progress is noted each year in the control of scab and orchard insects.

Among the experiments in spraying which are being conducted by the Departments of Agricultural both Federal and Local, are those with the Dusting machine. A considerable discrepancy in the results of the different experiments conducted was shown but enough work has been done to confirm previous conclusions reached in regard to this method; namely that while the dust spray will control biting insects as well as the liquid spray it is not generally as good in scab control.

The programme as arranged by Sec. Ells also gave place to potato culture and poultry raising, thus recognizing the fact that the majority of fruit growers in the Valley are also at the same time carrying on mixed farming, especially so since the war began. Mr. Paul A. Murphy spoke of the various diseases of the potato and tht proper methods of control. Blight both early and late, he would eliminate by spraying, leaf roll by obtaining seed from parts of the Province not so affected

Other speakers were Prof. Elford and Mr. McIntosh of Ottawa, and Dominion Fruit Commissioner Johnson.

The officers elected for the ensuing year were: F. H. Johnson, Bridgetown, President; H. S. Shaw, Berwick, Vice-President; Manning Ells, Port Williams, Secretary.

CONSERVATION OF BARN YARD FERTILIZER

While the price of Commercial Fertilizers has risen perceptibly since 1914, it is stated that a bushel of Corn or Potatoes will now buy about 35c. more fertilizer than at that time. This of course, is where it continues to be obtainable, but as Cannon and Crops use the same food, a shortage of fertilizer may be expected which will in many cases make it impossible to obtain the same at any price that will return sufficient profit from its use. Six hundred thousand tons of nitrates went to make explosives last year in the United States alone. A million tons of sulphuric acid were also similarly used last year, and the amount will approach two million tons this year.

The tonnage that is to be required by the Allies is tremendous and far in excess of what was anticipated, and this acid will be commandeered by the Government from various sulphuric acid maufacturers. Every ton of acid taken from the fertilizer manufacturer means a decrease of two tons of acid phosphate.

Gradually we are coming to realize that in sulphur there is a fourth "essential plant food element" oftentimes as important as the other three. In a rceent publication from Cornell University sulphur is grouped as a plant food along with nitrogen, phosphoric acid and potash.

The above facts are cited in several recent issues of the "News Bulletin" a publication issued by the Soil Improvement Committee of the National Fertilizer Association, which further states, "It must have taken real heroism to come forward, as Director Thorne of the Ohio Experiment Station has done, with the statement that 'the value of manure or other organic matter in the maintenance of soil fertility is limited by the nitrogen and mineral elements contained.' Even Professor Agee, seasoned fertility campaigner that he is, says it is hard to give up the old beliefs and not continue to see more in the manure than the nitrogen and mineral elements."

In this situation the importance of conserving the original strength and quantity of animal manure cannot be overestimated and the quality of Land Plaster in fixing and retaining the liquid and volatile elements thereof is well understood by those who have used the same.

The following is what is said concerning the value agriculturally of Gypsum or Land Plaster by the Dominion Chemist, Frank T. Smith, M. A. Sc., in bulletin No. 80 of the Department of Agriculture, Ottawa, December, 1914:—

"Gypsum may be valuable agriculturally in furnishing lime for plant growth, as it is fairly soluble in water but since this lime is combined with sulphuric acid and is present in a neutral condition it follows that **gypsum has no value for the treatment of sour or acid soils.** For this purpose it cannot take the place of quicklime, slacked lime, marl or ground limestone, which, as we know, are essentially alkaline in character."

"The two chief agricultural functions of land plaster are its property of flocculating clay and its effect or influence on the insoluble potash compounds setting free this element in forms available for plant use. The first of these functions makes it valuable for the dressing of heavy clay loams, which it improves in tilth by rendering them less plastic, more open and friable, in a word, mellower and more easily worked. The second role that we have spoken of constitutes it an indirect potash fertilizer, though of course, it does not add to the sum total of the soil's potash. It is this property that makes land plaster especially beneficial as a top dressing for clover, a crop that particularly responds to potash manuring. The usual application is in the neighborhood of 500 pounds per acre."

"Land Plaster possesses the property of 'fixing' ammonia and for this reason is largely used in stables and cow barns. Thus employed, sprinkling or dusting the finely ground material in the stalls, it serves to retain the nitrogen of the very readily decomposed urnie and incidentallly to keep the atmosphere of the building free from ammonia, pure and sweet. It is this use of land plaster

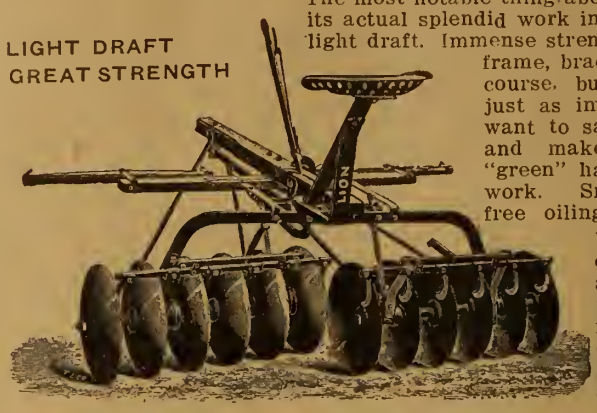
Frost and Wood Thoroughness is Well Illustrated in

The F. & W. Lion Disc Harrow



The most notable thing about it, apart from its actual splendid work in the field, is its light draft. Immense strength is built into frame, braces and discs, of course, but light draft is just as important if you want to save your horses and make it easy for "green" hands to do your work. Smooth running, free oiling, dustless ball bearings, cut down the work at the points where the main frame meets the disc sections. Driver's seat is also well back over the discs.

GET A FROST & WOOD AGENT'S ADVICE

It's free. It's reliable. It's worth having because our dealers have a wide acquaintance with our whole big line of implements, and know what they have done for others, and can do for you. Call on the nearest F. & W. agent.

"CHAMPION" DISC HARROW

GIVE YOUR CROPS THE SEED BED THEY OUGHT TO HAVE.

This is an out-throwing implement, the "Lion" shown above being in-throwing. It's just as serviceable, does just as good work; it is a matter of choice which you use. Like the "Lion," the "Champion" disc sections are controlled by very easy working levers placed at driver's hand. Good for any kind of harrowing you have—don't favor it, put it right at the stickiest, toughest field, and its light draft and sturdy strength will clean it up in short order.

Scrapers keep the discs clean and smooth

BUYING BEES FROM THE SOUTH

The purchase of bees without combs from the Southern States in spring, for making good the winter losses and increasing the returns of the apiary, has attracted considerable attention in Canada during the past two or three years, and has been tried out on a small scale in the apiary at the Central Experimental Farm, Ottawa, with the following results.

On May 8, 1916, a shipment consisting of six 1-pound packages was received by express from a dealer in Alabama. It was fourteen days on the journey, and only 17 ounces of bees were found to be alive on arrival. Another shipment consisting of three 2-pound packages each with an untested fertile queen, arrived in good condition on May 9, after only four days' journey. These three lots, after having been supplied with combs and brood from other colonies, produced 433 pounds of honey and built up into five strong colonies fit for wintering.

In 1917 a shipment consisting of three 2-pound pacnages each with an untested fertile queen, arrived in good condition. The three lots were each placed on four combs containing nothing but about 3 pounds of honey, and empty combs were added as needed. Producing a total of 316 pounds of honey valued at $47.25, an average of 105.3 pounds each, they were about as profitable as the regular colonies in the apiary, which gave in 1917 an average of 108.5 pounds of honey each, spring count, and for the five years, 1913-1917 an annual average of 106.7 pounds. The cost of the three lots was $9.75, express charges $1.25, total $11.00. In the fall each lot needed 21 pounds of sugar, costing $2.00, to make it heavy enough for wintering.

Another shipment, also consisting of three 2-pound lots each with an untested fertile queen, was received from Alabama on May 27th, and arrived in good condition six days after despatch. These bees were treated in the same way as the first shipment, but owing partly to the fact that they arrived 18 days later than the first, and partly to a worthless queen in one of them, to replace which a comb of brood was taken from one of the others, they made a much smaller profit, the one that was requeened producing only 4.7 punds, the one that supplied the brood 24.5 pounds and the third 24.8 pounds of surplus honey, a total of 54 pounds, valued at $8.10. The cost of this shipment with express charges amounted to $11.50.

The bees received on May 9 raised a large quantity of brood during dandelion bloom in the latter part of May. This brood produced bees in time to work on clover at the commencement of the flow in early July.

Information received from beekeepers in different parts of Canada, who ordered bees from the south for delivery in 1917, shows that some were disappointed because, expecting the bees in May, they did not receive them until June or July. The delay was caused partly by the exceptionally unfavourable spring for raising bees in the South, and partly by an unprecedently heavy demand. A remedy might be found in ordering early, as most dealers fill their orders, if they are not very large, in rotation. A few bee-keepers reported a large percentage of dead bees on arrival, due to detention at some place on the journey. The season for profit passes before such a loss can be replaced. In one or two of the provinces bees are liable to be held at the point of entry unless accompanied by a certificate that the apiaries from which they were sent are free from disease, and bees on combs are not permitted to enter—By F. W. L. Sladen, Apiarist, Dominion Experimental Farms.

PAPER CONTAINERS FOR HONEY

In consequence of the high price of tin pails and glass jars, an experiment in designing paper containers for granulated honey was commenced in February 1917, at the Central Experimental Farm, Ottawa. Nearly all kinds of honey produced in Canada will granulate hard 6 to 8 weeks after extraction, and in this form they can be conveniently distributed in small quantities in attractive inexpensive containers made of paper.

The most promising result has been obtained by pouring the honey when commencing to granulate into bags made of white bond paper, waterproofed with paraffin wax, the bags having been previously opened out on a wooden block and placed in attractive rectangular cartons, printed in one colour. Two sizes of containers have been tried, one holding 2-pounds of honey, the other 5-pounds. To prevent bulging, the containers when filled were wedged in a box or frame, but it seems that it would be better to pack them before filling in the boxes in which they are to be shipped adn to add small amounts of honey to each by means of a narrow spouted jug and spoon until all are filled, to prevent a possible bulging of the containers first filled. In this way the containers would be handled only once. A convenient size of shipping box would be one made to hold 60 pounds, that is thirty 2-pound containers in 5 rows of six, or twelve 5-pound in 3 rows of four, the box to be made ⅜ of an inch deeper, longer and wider than the carton content to take corrugated paper or other wrapping. By using an extension 4 to 5 inches deep and the same length and width as the boxes, the boxes may be tied on one another to stand while the honey is granulating. White honey gahtered at Ottawa, poured into the bags while thickening on September 20 was perfectly hard and fit for shipment on October 30. The packages seemed to be appreciated by housekeepers, the paper being easily peeled off the honey. The bags that had their bottoms folded three times and not sealed were more satisfactory than those with sealed bottoms, because it was found that they were less liable to tear when opened on the block. Leaking was practically eliminated when the bags in the cartons were filled with thickening honey and were packed at once in the box.

The inside dimensions of the 5-pound carton were 4 inches wide by 3 inches thick by 8¼ inches high. The bag to go inside this was made in the form of a tube 6⅞ inches wide, and 14½ inches long with 3 folds reducing it to 12 inches long. The 2-pound carton was 3 inches wide by 2½ inches thick by 5⅜ inches high inside. The bag to go inside this was 5⅜ inches wide, 11 inches long with three folds reducing it to 8½ inches long.

The cost of the 5-pound cartons printed, was $12.00 per thousand, and the bags for them $12.00 per thousand, total $24.00 per thousand. The cost of the 2-pound cartons printed was $8.00 per thousand, and the bags for them $8.00 per thousand, total $16.00 per thousand. 5-pound tin pails cost, lithographed, $9.00 per hundred, plain $8.00 per hundred, and 2½ pound pails lithographed cost $6.00 per hundred, all f. o. b. Montreal in January, 1917. There is therefore very considerable saving in the use of cartons, both in outlay to the bee-keeper and in cost of honey to the purchaser. Indeed, the saving is somewhat more than the above figures would indicate, because the lighter weight and bulk of the cartons and bags, which are supplied in the flat, reduces the cost of the freight compared with pails and glass jars. Against this saving must be placed the extra time taken in opening and filling the paper bags and cartons.

At the time of writing (Dec. 1917), lithographed 5 lb. pails are being quoted at $12.50 per 100 and the 5 lb. card cartons at $18.00, per 1.000.—By F. W. L. Sladen, Apiarist, Dominion Experimental Farms.

START YOUR GARDEN SEED BOXES

Seeds of early tomatoes and cabbage, as well as cauliflower and pepper, shoulud be planted in a seed box in the house at once. The seed box should be 3 to 4 inches deep, 12 to 14 inches wide and 20 to 24 inches long. A layer of about 1 inch of gravel or cinders should be placed in the bottom of the box, then it should be filled nearly full of rich garden soil, or soil enriched with decayed leaves or manure.

The rich soil beneath the family woodpile or around decaying logs is splendid for this purpose. The soil should be pressed down firmly with a small piece of board and rows made ¼ to ½ inch deep and 2 inches apart crosswise of the box. The seed should be distributed eight or ten to the inch in the rows and be covered. The soil sould be watered and the box set in a warm place in the light, in the sunshine by a window being best. Watetr enough must be given to germinate and grow thriftily, but not enough to leak through the box. If a piece of glass is used to cover the box, it will hold the moisture in the soil and hasten the germination of the seeds.

When the plants are from 1 to 1½ inches high they should be thinned to 1 or 2 inches apart in the row so as to give them space enough to make a strong, stocky growth. If it is desired to keep the plants which are thinned out, they must be set 2 inches apart each way in other boxes prepared as mentioned for the seed box. When the weather becomes mild, the box of plants should be set out of doors part of the time so that the plants will "harden off" in preparation for transplanting to the garden later. A good watering should be given just before the plants are taken out of the box for transplanting, so that a large ball of earth will stick to the roots of each one.

SOW ALL YOU CAN

The earlier you pick your choice of favored brands, the larger choice you have to pick from. The year 1918 will be a noted one for the price of crops and vegetable produce of all kinds.

Eureka Potato Planter

Pays for Itself in Labor and Time Saved

One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.

Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. **Furrow opens and seed drops in plain sight**—an equal distance apart, at uniform depth, with **absolutely no injury to seed.** Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.

Write for **free** catalog on this great line of potato planters—the largest line made. 3 sizes, 1 or 2 rows, with or without fertilizer attachment **In Stock Near You.** A success for over 19 years. Whether you are a large or small grower—**write today.**

Doubling Crops is Doubling Dollars

Doubling crops is more than doubling dollars, it is often trebling dollars and the soil is permanently improved every time you put fertilizer on it. Fertilizers are inexpensive compared with the results. Crops have advanced in price more than Fertilizers have. A Bushel of Corn will buy 50 per cent more Fertilizer now than before the war. You certainly will never increase crop production until you use fertilizer. There is serious shortage of farm products, so *order your Fertilizer now* for this year, when your effort to increase crops is so much needed. Explain your soil to us and state what crops you want to put in and we will advise you what kind of fertilizer and how much you need. Special rates to farmers who club together and order in car lots. Recommend a good reliable agent for us in your district, if you can.

DAIRYING.

FEEDING DAIRY COWS PREVIOUS TO FRESHENING

During the next few months a large number of dairy cows will be nearing the freshening period of their lactation, and the way they are managed at this time, in a great measure, will determine their usefulness after that critical time is passed.

During the latter part of pregnancy the foetus becomes very large and imposes such a heavy burden upon the cow in order to properly nourish it and still continue her efforts along the line of milk production, that for the last six or eight weeks she should be relieved entirely of the latter duties so that she may devote all her energies to growing the calf and storing up strength for the heavier obligations imposed at the time of parturition. At about three months from calving the foetus has not assumed any large proportions, but from this time on until delivery, there is a comparatively rapid growth, and the corresponding strain on the cow becomes very great. Most good cows are milking for several weeks after this time, and in order to do any business worth while at the pail she must not only have a very liberal ration, but food of the right kind and of excellent quality.

For the pregnant cow no food will quite equal nice fresh pasture. By this is meant not very young grass, which is nearly all water, but real pasture, six to eight inches high, where she can get a good bite and not have to work hard all day for it, using up nearly as much energy in the operation as the food is worth after she gets it.

Some cows will need a grain ration in addition to good pasture. While still giving milk, heavy producers are likely to consume considerable grain at this time, while others, especially those which consume large quantities of forage will not eat much; hence, it will not do to treat all animals in the same way.

Individuality in the management of the dairy herd counts for as much as any other factor, and the man who does not exert himself along this line is in a loosing game. All rules in the management of the dairy cow, therefore, must be on general principles, which are always open to revision for a single animal.

It is the practise of many dairymen to withhold any grain rations when the cow is dried up. This is usually poor policy; even if the pasture is good, many cows will not eat enough to store up the energy they need, and in order to come into the next lactation with good prospects of a successful year's production they must be strong, comparatively fat and healthy.

At this time of the year and under stable conditions one of the most essential factors of successful feeding is in furnishing the dairy cow with plenty of succulunce; either during her lactation period or while she is dry previous to freshening.

Canadian dairymen are fortunate in being able to grow, in abundance, two of the best crops in the world for this purpose; namely, corn ensilage and roots. Either of these in connection with alfalfa or red clover hay and a suitable grain ration, is very satisfactory, but it is when these are used in conjunction, and with other foods, that the gilt edge of winter feeding is made possible.

As in the case of pasture feeding, the cow should have all she can consume and keep in good health. If she is a heavy producer she will in all probability be quite thin when dried up and there will be no danger of her becoming too fat during the short time she will have to gain between going dry and freshening. A good ration for a thousand pound cow at this time would be about 20 pounds of roots, 20 pounds of silage, 2 lbs. of wheat bran, 2 pounds of ground oats and one pound of oil meal, in addition to all the alfalfa or red clover hay she will eat up clean.

As a cow nears freshening, if she is developing a very large udder the ration may be reduced considerably, all round, and the amount of hay limited also. Some hardy cows will eat enough hay to overtax their digestive capacity when only a small amount of concentrates is given. Moreover, many cows are injured by overfeeding just previous to and soon after calving, and while it is a good policy to get a cow down to working order as soon as possible, time is often gained by going slowly just at this period.

Cows should have salt regularly during all times of the year and while they will not eat nearly so much when dry as when giving a large quantity of milk and especially on pasture, it is essential nevertheless, that they have all they will take; and further, it should be given them every day regularly and not once a week or month, as the case may be.

PRACTICAL STABLE VENTILATION

Dairymen, generally, realize the full importance of pure air to the herd, because they know the condition in which an unventilated stable is found on a cold morning. They know the air in such a barn is bad, and that the damp, frosty barn is an unhealthy place for the cattle. Not only is such a condition injurious to the stable itself, affecting the walls, rafters, ceiling and equipment, causing wood to rot and metal to rust; but most important of all is the injurious effect of the lack of fresh air on the vitality of the animals. Without pure air, they are unable to get the full benefit of their food, the milk production is lowered and the cattle are more subject to diseases, such as tuberculosis.

The dairyman works hard for six or seven months of the year preparing expensive food in the way of hay and grain for winter use. He cannot afford to feed this expensive food during the winter months and fail to provide fresh air so that the animals may properly digest it and turn it into milk. A furnace can be filled with expensive fuel, the fire started and a forced draft used, but if the air forced into the furnace does not contain oxygen, the fuel will not burn properly and much will be wasted. A similar action takes place in the animal's body and unless oxygen is provided by bringing fresh air into the barn, the animal will waste feed just as the furnace waste fuel, and the milk production will be reduced.

To provide fresh air, a good ventilator is necessary—the ventilator is one of the most important items of barn equipment. But the ventilator alone cannot furnish the pure air. Ventilation depends on the proper working out of certain scientific rules, and if not correctly done, the system cannot give the best possible results. The dairy barn, of course, is not the only building that requires ventilation. Pure air is just as important in horse stables, hog houses, poultry houses, homes, factories, etc.

Every system of ventilation depends for its efficiency on the thoroughness with which foul air is removed and fresh air brought in to take its lpace. The motive power on which other systems depend for a continuous upward current in the foul air flues, is a difference in temperature between the air in the stable and the air out of doors. Or in other words, they depend upon the air in the stable being lighter (warmer) than the outside air. The air in the stable being warmer, the air in the inside opening of the outtake flue will be lighter than the air outside and will rise.

The upward movement of air in the flue started in this manner is assisted to some extent by "aspiration"—that is, by the wind blowing across the top of the flue; just as a chimney has a stronger draft when the wind is blowing hard. But where dependence is placed wholly on the motive power furnished by the warmer (lighter) air and by the wind blowing across the top of the outtake, the ventilating system will sometimes not operate satisfactorily in the warmer weather and under certain atmospheric conditions.—By O. .W. Townsley.

He turns pretty slow—but he gets all the cream!

—owing to the wonderful Suction-feed, which insures just as clean a skim when you turn the Sharples Separator slow, as when you turn it fast! The boy might turn the crank only 35 to 40 turns per minute, but he would get just as clean a skim as if his dad were speeding the crank around at 50 turns per minute.

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

—the *only* separator that will skim clean at widely-varying speeds
—the *only* separator that gives cream of unchanging thickness—all speeds
—the *only* separator that will skim your milk quicker when you turn faster
—the *only* separator with just *one* piece in bowl—no discs, easiest to clean
—the *only* separator with knee-low supply tank and once-a-month oiling

The hired man, especially at the end of a hard day's work, will but seldom turn a separator up to regulation speed. And you, yourself, are often "dead-tired" and slacken down unconsciously. All fixed-feed separators when turned below speed lose cream—from 7 to 13 lbs. per cow per year. This loss totals 80 million lbs. of butter yearly in the North America alone—Sharples can save it all!

Discard your old fixed-feed separator. Get a new Sharples Suction-feed—the *only* separator that feeds the milk into the bowl in direct proportion to the separating force, thus getting cream now wasted by all other separators. Write for catalog today, addressing Dept. 79, and see your dealer as well.

Dyspepsia and Stomach Troubles

Dr. Cassel's Tablets Restore the Natural Power to the Digestive Organs and Effect Natural Cure

Dr. Cassel's Tablets cure Dyspepsia, Flatulence, and other digestive troubles by giving strength to the digestive organs. They enable the stomach to produce those nautral digestive fluids which dissolve food, and so dyspepsia becomes impossible. Wind or gas cannot form, pain cannot arise, because your food is properly digested and absorbed for the nourishment of your body. Sufferers in all parts of the Empire have been cured by Dr. Cassel's Tablets when other means have failed, because these supreme restoratives overcome the cause of the trouble.

A free sample of Dr. Cassel's Tablets will be sent to you on receipt of 5 cents for mailing and packing. Address Harold F. Ritchie and Co., Ltd., 10 M'Caul Street, Toronto.

Dr. Cassel's Tablets are the supreme remedy for Dyspepsia, Kidney Troubles, Sleeplessness, Anæmia, Nervous ailments, and Nerve paralysis, and for weakness in children. Specially valuable for nursing mothers and during the critical periods of life. Price 50 cents per tube, six tubes for the price of five, from Druggists and Storekeepers throughout Canada. Do not waste your money on imitations; get the genuine Dr. Cassel's Tablets. **Proprietors, Dr. Cassel's Co., Ltd., Manchester, Eng.**

The publisher of thebest Farmer's paper in the Maritime Provinces in writing to us states:

"I wouuld say that I do not know of a medicine that has stood the test of time like MINARD'S LINIMENT, it has been an unfailing remedy in our household ever since I can remember, and has outlived dozens of wouuld-be-competitors and imitators."

med about pieces of furniture known to our twentieth century civilization. And part of the bad usage is quite unnecessary.

The war is creating a special reason why cream cans should be treated with greater respect. There is a present shortage of tin plate, from which cream cans are made, and in the United States, as well as in Canada, efforts are being made to impress can handlers with the importance of caring for these vessels. One United States publication just to hand, says, "It may soon be impossible to secure more milk, cream or ice cream cans until after the war." If a real famine in milk and cream cans were to occur, the loss to the farmers would be much greater than usual because of the higher prices which are now obtainable for milk and cream.

Here are Some "Cans"

You can avoid using milk or cream cans for wrong purposes. Sometimes people put gasoline in them and ruin them almost immediately.

You can refrain from battering the cans needlessly.

You can return other people's cans, if you happen to get them by mistake. The owner needs them.

You can see that your can does not lie about the railway station. Even though you may not be going to use it at once, take it away and care for it.

You can remind the railway agent that he may help by giving cans as much protection as possible.

You can rinse the vessel before using. It may have been thoroughly cleaned at the factory; but it needs a fresh rinse before using.

You can keep the vessel clean inside. Use a little sal soda occasionally in washing the tins out, if necessary.

You can see that a tin does not stand in a damp place or with moisture inside. Especially at the end of the season, when the cans are being put away, dry each carefully and store under cover in a dry atmosphere.—By L. A. Gibson, Dairy Commissioner for Manitoba.

INJURIES TO COWS' TEATS AND UDDERS

Prevention of injury to cows' teats and udder is most important, says M. H. Reynolds, veterinarian, University Farm. Injury may be caused by dragging over high door sills, by hurrying the cows from pasture when the udder is full and by allowing them to lie on cold, bare cement floors. The teats, especially the hind teats of low-hanging udders, are sometimes injured between the cows' hocks and the floor when the cow rises.

If the injury is slight, there may be only a bit of dry blood on the end of the teat and the cow may be a little harder to milk than usual. Such cases usually heal promptly, but if the bruised end becomes infected the teat canal and the udder may become inflamed. Sometimes the end of the milk duct is permanently damaged. A severe bruise may result from a teat being stepped on by a cow in a neighboring stall, while the cow is lying down, and if she jumps up suddenly actual tearing may result.

The treattnmeent varies greatly according to case. Conservative treatment will often save teats that are only slightly injured. Long continued bathing with hot water and gentle massage, if given early, will often open a closed canal. Much less damage may result from leaving milk in an injured quarter for twelve or even twenty-four hours than from an attempt to force open the end of an injured teat with a milk tube or probe. When teats are badly damaged, a competent veterinarian should be called.

Repeated chilling of cow's udders, especially by washing and then exposing them to the cold air, often causes trouble, says Dr. Reynolds. The canal becomes partially blocked, making milking difficult. Small masses of flaking material appear in the milk. In some cases the end of the canal is partly or wholly closed by a scablike formation. Considerable irritation of the skin, particularly around the base of the teats, will usually be noticed. The remedy is, of course, a different method of cleaning the udder, in cold weather.

In all cases of udder trouble, where the vessel is inflamed the best remedy is simply warm water applications supplemented with vigorous rubbing with camphorated oil. This liniment may be procured at any drug store. Extract of belladonna also is an excellent embrocation to apply for inflammation. Bathe the udder in water as hot as the hand can bear. It alone will reduce the swelling if continuously applied.

THE NEW DE LAVAL CREAM SEPARATOR

Will Give You Greater Capacity, Longer Wear, Better Service, Bigger Value

THE bowl of the New De Laval has greater capacity for a given size and a given speed than any other. The experience of thousands and thousands of users has proved that a De Laval will outlast and outwear any other make.

Look well to service when you buy a cream separator. That means more than anything else. That should include not only a good working and reliable machine, but the right sort of attention and interest on the part of the seller, not only at the time the machine is set up but as long as you continue to use it. De Laval service is well known. You can depend upon it.

Value depends upon the amount and quality of service the separator gives you—what you get out of it. You get more value for your money when you buy a De Laval, because it will give you more and better service than any other separator.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below

COST OF KEEPING A COW

The New Hampshire Experiment station has compiled figures of cost of keeping a cow a year and of producing a quart of milk from the records of cow-testing associations and from their own herd as follows: Cost of feed, $73.03; labor, $32.33; delivery, $7.18; housing, $9.70; depreciation, on cow, $8.83; bedding, $4.00; bull, $3.79; taxes and interest, $4.55; ice, coal and wood for heating, $2.17; veterinary service and medicine, 87 cents; tools, utensils, salt, etc., 53c.; cow-testing association expense per cow, $1.40; total, $147.47. The cow is credited with manure worth $15.00, and a calf worth $3.00, total $18.00, leaving the cost item of $129.73.

Massachusetts Agricultural College, in a similar experiment, found the cost to be $146.04, and the Connecticut Station to be $149.07.

SUMMARY OF REPORT OF COMMITTEE

(Canadian Swine Breeders' Association)

The Committee appointed by the Executive of the Canadian Swine Breeders' Association consisting of the President, P. J. McEwen, Wyoming, Ont., J. E. Brethour, Burford, Ont. and the Secretary, spent the week ending December 22nd, 1917 in the States of Illinois, Iowa and Indiana. In order that they might have a full understanding of the methods by which the breeders in the corn belt have been able, in the last few years, to hold so effectively in check the plague of hog cholera.

In the United States two treatments are used whereby hogs are immunized against cholera, the "single" or "Serum alone" and the "double" or "Simultaneous". Serum is obtained from hogs which have been not only immunized but hyper-immunized, and when injected into a pig it will render only a temporary immunity, covering a period of five or six weeks. Serum cannot set up the disease in healthy hogs and consequently its use does not expose a herd to any danger. Virus, on the other hand, is a preparation of the blood taken from cholera hogs. It will, in susceptible pigs, produce the disease.

The single, or serum alone, treatment consists of the inoculation of swine with serum to establish a temporary immunity. In the double, or simultaneouus treatment, serum and virus are injected at the same time, imparting to the hog a lasting immunity to cholera.

The first place visited was Ames in the State of Iowa. The Division of Veterinary Science at Ames maintains and operates a laboratory for the production of serum and virus. Dr. Cole, who has been in charge of this plant for four years, was interviewed on the subject which the committee were investigating and he imparted a great many interesting facts. Some of these were: "A Vaccinated pig will not transmit the disease unless the pig gets sick." "All the show men and 99 per cent of the breeders of pure bred hogs in Iowa double-treat."

Both Dr. Cole and Dr. Stange, who is Dean of the Division of Veterinary Science expressed themselves wholeheartedly in favor of the double treatment and neither tried to cover up any defects peculiar to this method of prevention.

Needless to say, the College herd of swine was double treated and Prof. Pew, head of the Animal Husbandry Department, strongly endorsed its uuse.

From Ames the delegaton journed to Davenport, Iowa, where they were met by the hospitable proprietor of Iowana Farms, Col. French, and the genial and efficient Superintendent, Dr. Smith. Pure-Bred Holstein cattle and Berkshire swine have been developed to a remarkable standard of excellence at Iowana Farms, and it was indeed a pleasure to inspect such wonderful herds where the tuberculin test for cattle and double treatment for hogs is practiced so thoroughly. The herd of swine, about 500 in number, were said to be all immunized and the Committee agreed that they never saw a more thrifty or healthy looking bunch of pigs anywhere. A report of the methods followed in housing, yarding and feeding would be instructive, but space will not permit. In the neighborhood of 100 sows are farrowed each year and all breeding stock sent out is guaranteed "cholera-immunized." They are shipped to practically all States of the Union and no one has suffered. When asked for an expression of opinion regarding the double or simultaneous treatment, Col. French made the following statement: "Six years ago I instructed my Manager that unless some protection against hog cholera could be found to cease breeding swine. After investigation at our State College and at Washington, we became convinced that the double treatment was trustworthy and we inoculated $40,000 worth of hogs with serum and virus. We have had no outbreaks of the disease and none of our customers have suffered. In one year the loss from hog cholera in our State, (Iowa) was reduced from $30,000,000 to about $3,000,000. Washington recommends the double treatment and without it we could not maintain a large herd of swine."

The Iowana herd was itself a remarkable endorsation of the double treatment.

The next stop was at the farm of W. S. Corsa, Whitehall, Illinois, where Berkshires are a specialty but where a laboratory is also operated in the production of serum and virus. The immense herd yarded under ideal conditions, were all double treated and gave all the evidence required in support of the method. Mr. Corsa said that he could not continue breeding if he could not double treat, and that he was obliged to treat in order to sell his stock.

In the State of Indiana the Committee endeavored to get the views of the out-and-out farmer in respect to double treatment. Boone County, the leading County for swine in the State, was visited and there two farmers were interviewed. It was learned that the farms averaged about 100 acres and that each farmer keeps about six brood sows. The general practice is to have all sows farrow in the spring, while about half of them are bred back to litter again in the fall. This works out in the neighborhood of three litters in two years per sow. Joseph Beelar, a farmer who buys and feed extensively, spoke favorably of the double treatment and said that without it as an insurance he would have to double on his money one year for fear of losing it all the next. If the pigs are not immune when he brings them home, they are double treated, and kept by themselves until danger from any "breaks" is past. J. W. Brendel, a prominent breeder, endorsed the double treatment. He stated that for a period of thirty years prior to the advent of the double treatment his loss would be as high as 30 per cent., but for the last six years his loss would not exceed one per cent. "Everyone does not vaccinate in this County," Mr. Brendel said, "but the immune herds act as a bucer, checking the spread of the scourge and thus preventing heavy loss." Following are some of the arguments and opinions advanced by these two Boone County farmers: When breedings hogs can be rendered immune there is greater opportunity to raise the standard of quality because the stock is not periodically destroyed. The foundation of the herd should be maintained. When the veterinarian visits the farm to inspect or treat hogs, he often points out necessary changes in sanitation and conveniences that benefit the farmer and render the industry more profitable for him. The sentiment or belief in Boone County is that immunized hogs are not carriers of the disease. At auction sales, those who can make the statement in their catalogues that the hogs to be sold are vaccinated. This helps rather than injures the sale, and many farmers with non-immune herds are buyers. Mr. Brendel himself did not vaccinate his young stock in 1917 and he considered that he lost $15 per head at his fall sale, because he was not able to guarantee his young hogs immune.

During 1917 the State of Indiana, through the State Veterinarian, Dr. Northrop, collected 55,000 shoats in the stock yards where being offered for sale and sent them back to the country to be fed. These pigs averaged around 100 pounds each and if a special effort had not been made they would have been sacrificed. They were all double treated, dipped and shipped in disinfected cars to farmers who would take them to finish. These shoats gained one and a half pounds per day on the average, and were usually returned to market after they had gained 120 pounds, or at the end of an 80 day feeding period. The spread in price amounting to 4.4c per pound was satisfactory, and the farmers profited. The facts of the case bearing on the matter in hand are, that the loss in these double-treated hogs thus handled was less than one per cent., and this from all causes.

While in the State of Indiana, The Deputation visited the plant of Pitman-Moore, where serum and virus are produced in large quantities. Here the Superintendent, Dr. Roberts, spared no efforts to demonstrate every operation in connection with the manufacture of the product and showed the party through all branches of the institution that they might not fail to witness any step in the production of serum and virus. The cleanliness of the plant, as well as the sanitation of the surroundings, were beyond criticism. Lengthy comment on the equipment and methods used would be somewhat technical and out of place here, but the party were impressed very much by the despatch with which every operation was performed and the exhaustive efforts made to turn out a potent and clean product. Government inspection was very rigid, as evidenced by the number of federal inspectors stationed in the different branches.

A few notes as to how serum and virus are made should suffice. To obtain virus young, healthy pigs are inoculated with virus alone in order to set up the disease. In about seven days they are killed and the blood from them is filtered. The filtrate which contains the disease producing properties is mixed with a percentage of carbolic acid as a preservative and stored in a cool place. Every hog has a number, and a chart is kept on which are reported the temperatures and all information concerning him when both dead and alive. After being bled he is "posted" (brief for post mortem examined) and sent to the tank. Any evidence of tuberculosis or other contagious diseases would at once condemn the product of his blood. To test the potency of the virus a pen of eight pigs are used; six receive both serum and virus, while two are injected with virus alone. The two virus pigs should develop the dis-

ROYAL PURPLE
Stock Specific
This popular animal regulator and fattener is being fed to stock in thousands of stables every day during the winter. It is good for cows, steers, horses, sheep and swine. It tones up the entire system by improving digestion, and purifying the blood. Maximum nourishment is obtained from all food eaten when our Stock Specific is fed regularly.
Cows Give More Milk
Dairymen state positively that their cows give from one-quarter to a half gallon more milk each, daily, when fed Royal Purple Stock Specific. Think how you would benefit by its use if milking only a small herd.
It rapidly improves the condition of hide-bound horses, and enables you to fatten hogs in from three to five weeks less time than you would otherwise require. Give it a trial.
Feedmen everywhere carry it in large and small packages. Ask for our 80-page booklet.
W. A Jenkins Mfg. Co. Ltd., London, Canada

PEERLESS THE ALL AROUND FENCE

HAD BOILS and PIMPLES
ON FACE AND BODY.

Boils and pimples are simply evidences of bad blood that is circulating in the system coming to the surface.

The only way to rid yourself of these painful and unsightly blood diseases is to have your blood purified by Burdock Blood Bitters. It removes every particle of foul material from the blood, and the skin becomes clear and smooth, and free from all eruptions.

Mr. Roy A. Bovay, Trenton, Ont., writes:—"Two years ago I was very much troubled with boils and pimples on my face and body. A friend advised me to take Burdock Blood Bitters. I got three bottles, and before I had finished the third one, my boils and pimples had all disappeared, and my face and body were as clear and as smooth as any baby's could be."

Burdock Blood Bitters has been on the market for over 40 years. You are not experimenting when you buy it.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

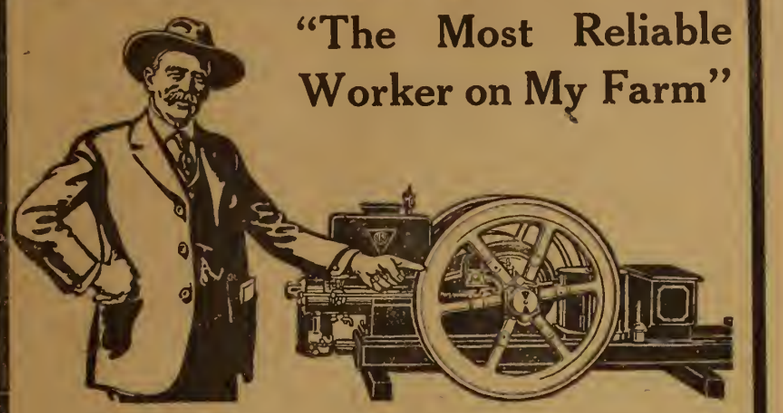
ease if the virus is potent; and if the virus is potent, any "breaks" in the remaining six would show something wrong with the serum.

In the production of serum the hog is first immunized in the usual way by vaccination with serum and virus. In the vicinity of 100 days he is "hypered", or hyper-immunized by injecting into a blood vessel of his body 5 cubic centimeters of virus per pound live weight. This amounts to approximately one quart of virus to a 200 pound hog and at the plant of Pitman-Moore, it is injected through a blood vessel in the ear, by what is ostensibly a very simple operation. This produces a "hyper" or hyper-immunized hog, from whose blood the scrum is obtained. About ten days after hypering the hog is tail-bled and four to five c. c. of blood are drawn per pound of live weight. In seven days the hyper is tail-bled again and a similar amount of blood is extracted. At the expiration of the next seven days the hyper is killed and all his blood is preserved. In killing, about 2,600 c. c. of blood is obtained from a 240 pound hyper. The carcass is posted, and after passing inspection goes into the cooling room and later is processed or cured for human consumption. It is Government approved meat, healthy and wholesome in every detail. After a hog is hypered, it must gain in weight until killed in spite of the tail bleeding. The same record is kept of each individual as in the case of virus pigs. The charts then form the office records and all serum and virus, which must have its serial number, can be traced to the animal from which it was taken. Laboratory tests are then carried through and a thorough bacteriologicals examination made of the product. All hogs are prepared for bleeding or killing just as carefully as a human patient is "processed" before an operation. The Government sits constantly on the job and cleanliness, sanitation and disinfection are a religion with Dr. Roberts.

On the return to Canada, the Committee interview Dr. Torrance, Dominion Veterinary Director General and consulted with him as to what changes he might be able to recommend in our quarantine laws. Dr. Torrance assured the committee that he would recommend the following changes.—That the present regulations dealing with the importation to Canada of pure bred swine be changed so as to allow double-treated pigs to enter Canada, providing that the pigs were sold at least thirty days after double-treating and that they would be subject to a thirty days quarantine at the port of entry. Also that where any county or counties desire to use the double treatment, in controlling hog cholera, that he would recommend that permission be granted to such county or counties, always subject to supervision and quarantine.



"The Most Reliable Worker on My Farm"

My Alpha Gas Engine

THAT'S what Alpha users all over the Dominion are saying. Owners of Alpha Engines are getting real engine service. The more they know about engines, the more they appreciate the sterling qualities of the Alpha.

If you are without an Alpha, you are not equipped to do your share of Canada's farm work.

The Alpha never wants a holiday, and will work twenty-four hours a day if necessary.

You can overcome the lack of human labor by installing an Alpha Gas Engine. The Alpha does many kinds of work more quickly and more cheaply than it can be done by hand, and you can always depend upon it when you need it.

The sooner you get your Alpha working for you, the sooner it will begin to save its cost.

Alpha Gas Engines are made in eleven sizes, 2 to 28 H. P., and each size is furnished in stationary, semi-portable, or portable style, with hopper or tank-cooled clyinder.

CARE OF CALVES IN SUMMER

P. H. E. writes: "I have read with interest your several good articles on the care of calves. I thought that the following account of my experience would be helpful.

"Careful attention should be given to the care and feeding of young calves during the summer months. The weather is hot and the milk will sour quickly if left exposed to the heat. Fresh skim milk contains the protein needed for the best growth of the young calf just the same as whole milk, and the carbohydrates can be supplied in another form, so I have always found it advisable to take the young calf away from the cow as soon as it removes the first milk, then after a short period of feeding whole milk start them on skim milk fresh from the separator.

"While of course, prefer to have the cows freshen in the fall, there are always bound to be some cows freshen in the summer. do not think it best to let the young calves be exposed to the hot sun, but provide good shade for them. Under the trees where there is plenty of good grass is an excellent place to put them, then they soon get to eating the green grass and there is sufficient breeze to keep them cool and drive the flies away. A constructed shade will do if no trees are to be had but it is less desirable.

"Every effort should be made to keep the pails clean in which the milk is fed. A little milk left in the bottom of the feeding pail will be sour before night, and use of such a bucket in feeding will result in scours or other troubles. I never feed old milk to the calves but feed them the fresh skim milk immediately after it comes from the separator; it is warm then and makes a good nutritious ration.

"Cleanliness sould always be observed about the calf barns and fresh, clean bedding supplied each day. If the yard is inclined to be low and muddy it should be filled in and not permit the calves to walk about in two or three inches of muck. Such a yard breeds flies and is not fovarable to strong growth."

GET RID OF THE LICE ON CALVES

Calves infested with lice do not thrive. Frequent examinations should be made to make sure lice are not present on the calves or in the barn.

If lice are discovered the first thing to do is to get entirely rid of them.

This necessitates a complete cleaning of the barn and the disinfection of it by a thoroughly spraying every crack and corner ith a 5 per cent. solution o fcoal tar dip. The calves should be washed with a solution of coal tar disinfectant ranging in strength from 3 to 5 per cent. If this is done in cold weather the calves should bc rubbed with dry cloths and kept blanketed until dry to prevent their catching cold. Crude oil may be used instead of coal tar disinfectant by carefully and thoroughly rubbing it over every portion of the body.

These treatments will not kill the nits or eggs that may be present so that the barn disinfectant and the treatment o the calves must be repeated in esven or eight days. In this manner the calves and the premises can be rid of these abominable growth destroyers.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

Mrs. M. Summers
BOX 309 WINDSOR, Ontario

THE HORSE

WEANLINGS IN WINTER

The time when weanlings should be put up and fed depends on their age, the range and their condition at the beginning of the winter months. Let us leave to one side those foals which have been and are to be continuously fed for the greatest growth, and consider the ordinary farm foal without the inheritance of ton weigth, but whose usefulness and profit depend on maturing to from 1,500 to 1,800 pounds.

In a moist climate, where all the grain that lies out will sprout and be lost, conditions are different from those in a dry climate where grain as a rule will be preserved, even though it may weather. In such dry fields horses find a great deal of picking and there is some green alfalfa mixed with the old until November or December. Indeed the close-feeding sheep will often find enough green sprouts on which to bloat quite late in the season.

I remember one man who had quite a reputation for raising big horses and medium sized mares and by large stallions, who did not put up his early weanlings until Jan. 1 to feed them grain. But he was sure to have them in by that time and the late-dropped foals earlier. On this farm little excepting grain and alfalfa was grown, as there was no late water. All the horses were turned out immediately after harvest into knee-high alfalfa and the considerable gleanings of the grain fields. Long before winter came both young and old were in full coat and as fat as seals. There were only about 20 horses on the 160 acres, and between strawstacks and alfalfa they found plenty of nutritious feed.

While it is a good live stock axiom to keep stock growing all the time, it si none the less true that horses will grow ahead of their age where there is plenty of feed. In other words, they can be advanced about 6 months with 90 days' feeding, when conditions are favorable, and reach early maturity by the heavy feed route. This is less true of weanlings than of yearlings, two and three-year-olds. At the same time, if they are closely watched, they may be left out so long as their demeanor indicates thrift and contentment.

The weight of an animal is not suffiecient indicatioin that it is doing well. Long before there is any perceptible shrinkage a stockman should be able to tell that animals are merely holding their own and drawing on their easily reduced inside fat. Excessive inside fat is a species of degeneration inimical to the race horse when it goes into training or to the over fat horse suddenly thrown into the plow, but animals at liberty seem to be able to endure quite a bit of it and remain not only healthy but exuberant with this provision for future needs.

When feeding is begun too late growth is lost and horses mey shed their coats at a time when they still need them, especially if the hair has become dry and dead, having ceased to take up oil through its roots. It would be unkind thoroughly to clean a horse and leave him exposed to the elements, but my experience is that there is a medium between this and allowing the skin action to stop altogether. I believe that an entire clogging of the pores is detrimental to horses. About once or twice a week I like to brush weanlings moderately, without removing all the scurf, which indeed might prove a week's job. A slight stirring up of dead matter at the hair roots stimulates healthy skin action. The weanlings like it and it gentles them by pleasant association with human company.

At the same time feet can be looked over and kept in shape, saving many a crooked ankle or wrong set of bone. If there are any lice they can be attended to and the sapping of the life blood of the youngster stopped. Continuous an dhealthy excretion through the skin should be constant for best health, and this will largely depend on the feeds used and the amount of exercise taken.

Few people grow carrots, though they are among the most productive crops and are coming into use for cattle feeding in Colorado. Like other roots they have the disadvantage that they may become frozen. Bran, barley and flaxseed can be procured on every farm, however. Any of these well scalded and fed twice a week will have a beneficial effect. The flaxseed may be ground and fed with the dry grain, a teaspoonful or a little more for weanlings at a feed. Even with the flaxseed a couple of feeds a week of scalded barley will not come amiss, especially with weanlings on strong or dry feed, barley when scalded, having a beneficial effect on the intestinal tract. If the barley is well covered with boiling water in the morning and kept in a moderately warm place, it will be ready to feed at nigth. It should be soft enough to flatten fairly easily between the fingers.

Of course bran mashes are good, but I do not believe they have as beneficial an effect on the digestive tract as the flaxseed or scalded barley.

Potatoes are one of the best feeds and promote shedding in the spring or to clean up the skin of a bunch of dirty horses, as they have a special action on the skin. A few horses will be found that will not eat them at all, but it is mostly when first offered. A small quantity can be choped into the feed until they get used to them.

If the horse droppings are about as if they were on sound grass, there need be little fear but that all is well, and the feed being sufficient, they will make good growth.—L. Oglivy in Breeders Gazette.

CHILLS, COLDS AND CATARRH

Never neglect to treat the early stages of a cold or chill in the horse. Unobserved or uncared for, itmay be followed by catarrh, inflammation of the windpipe, followed by chronic cough, thick wind, roaring, bronchitis, and pneumonia. Or the body by loss of vitality may offer only a feeble resistance to the invasion of strangles, influenza and glanders. The organisms that produce these diseases are frequently to be found in the neighborhood of stables, probably in a dormant condition, but always ready to obey Nature's first law, which is "increase and multiply." Probably there is no greater fallacy than to suppose that cold as shown by the thermometer is the only cause of a catarrh. Closer observation has taught us that satarrh is just as frequent in warm as in cold climates, that it is more severe and frequent in the late spring and early autumn than in mid-winter, that rain, fog, extreme cold alone will not produce it, and that the disease is an infectious fever, and is caused by the entrance into the blood stream of two or three different germs. In a pure atmosphere a horse does not contract a true catarrh. The animals in polar expeditionns were free from it, but fell victims when ther returned to civilization.

A horse well fed, with a natural coat on, and an open shelter available rarely suffers, but placed in a hot, dirty, badly drained, ill-ventilated stable, and then trouble begins, and if the owner trusts to his groom or carter the evil will be accentuated by the closing of all apertures that may admit fresh air, so that a simple catarrh will develop into a serious one, because complictaed with auto-toxins. A draughty stable or a hot stable are both evils to be avoided, and plenty of insanitary stables by the expenditure of a few shillings and the labour of a man who can use his hands might be made proof against many respiratory diseases in the animals. Is a horse to be neglected then, even when the stable is perfect? Certainly not. The skin of the horse is plentifully supplied with sweat glands, even more than in many of our domestic animals, and if the horse has nothing to do but slowly potter about a field he does not sweat. But put him to work and then the internal heat of the body is increased, the sweat glands being stimulated into activity, pour out their secretions, and fatigue toxins accumulate in the blood. The British navvy takes off his coat while at work, but when at rest he carefully puts it on again. Whenever a horse comes in from work, whether wet or dry, let him have a good wisping. Apply no water to the legs or feet, but the latter can be examined for gathered stones, etc., without washing. Then if cold or wet, bind bandages or haybands on the legs, and if a heavy coat put a few wisps of straw under the rug to allow the sweat to escape.

A sudden change to a heated atmosphere may be more dangerous than the reverse. Independently of the skin action there is an enormous respiratory surface in the lungs of many hundred square feet, and the changes in the circuation of the blood and imperfect oxidation caused by heat and cold try the horse severely at times, causing also sympathetic troubles in the liver and kidneys. It is quite possible to contract a simple mechanical cold from disturbances of equilibrium in the various systems of the body. In a few hours with appropriate care it will pass off; but, as I remarked before, in the majority colds are infectious and due to micro-organisms. The first effects of a cold is to drive the various antibodies—the defenders—from the skin and mucous surfaces, these temporarily leaving their posts (unless a reaction sets in(and permitting the invaders to obtain entrance.

Symptoms of Catarrh

These are a staring coat, shivering, coldness of ears and extremities, a dull, depressed look, loss of appetite; later on sneezing, a slight discharge from nostrils, afterwards becoming thicker; in fact, the name "catarrh" is of a Greek origin, and signifies to "flow down." A few hours after the commencement of these symptoms fever will be present, at first not more than two degrees, and here let me advise all horse-owners to purchase and use a clinical thermometer. This inexpensive instrument, used in hospitals in the treatment of humans, answers all purposes, and costs from any chemist not more than 2s. In using it, set the index moisten the bulb, stand on the near side of the quarters, hold the tail on one side, and with the left hand introduce the thermometer into the rectum within an inch of the top, and retain it there for two minutes, observing the results. An elevation of 2 deg. over 100 deg.F. indicates fever, and the animal must not be considered safe. If the temperature persists at 4 deg., put the case under your veterinary surgeon's guidance. The wise man will always know his limitations and recognize the fact that the perofessional, from his long and specialist training, must always be superior to the mere amateur or charlatan.—English Vet.

LAMPAS

"I have a valuable young mare of five years of age, and she always has lampas growing over her teeth. I have bled her often but it does not seem to do her any good. Please let me know what I sould do to cure her.—J. R."

This condition is common until after five years of age (when dentition is complete). The condition does little or no harm. All that can be done is to scarify the gums to allow escape of a little blood.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applicatlons of Caustic Balsam relieved me of goltre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.50 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

BUTTER PARCHMENT
Maritime Farmer Office

WORMS — DIFFICULT URINATION

"(1.)—I have a mare six years old, in foal, and she is troubled with worms. What do you advise me to do for her?

"(2.) We have a driving horse three years old, and keep the sheath well cleaned. He attempts to urinate quite frequently, appears to be pained, will move about, then urine drops from his sheath after a while. He sometimes makes his water quite natural. It is not a case of too frequent urination so much as the unnatural way. We have given him a medicine. His water appears to be all right.—A.B.C."

(1) Mix equal parts of powdered sulphate of iron, sulphate of copper, and tartar emetic. Make into 24 powders, and give her a powder every night and morning. After the last has been given, give her 1 pint of raw linseed oil.

(2) The symptoms nidicate calculi (stones in thebladder). An examination by a veterinarian would probably confirm the diagnosis. Unfortunately it is a condition in which the administration of drugs has little or no effect and an operation is seldom attempted. The calculus that is causing trouble may enter the urethra and be passed off, or may become fixed in the tube when it could be located by a veterinarian and removed by an operation. About all that can be done is await developments.

CHRONIC INDIGESTION

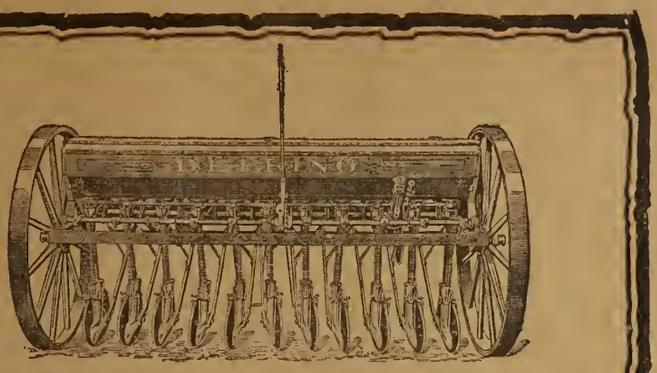
Veterinary Editor,—"I have a mare nine years old that is thin in flesh, and long and rough in hair. She is well fed on good hay and about three gallons of oats per day when she is working. At times she feeds well and has a good appetite and at other times she eats very little hay. She was always in good condition until about a year ago, when she began to fail. I got her teeth filed but it did not seem to doher any good. Her bowels are irregular and she evacuates often and a little at a time. Would she have indigestion? Please advise me what to do for her.—W.R."

Have her mouth examined by a veterinarian and if necessary, have her teeth dressed again. Purge her with 8 drams aloes and 2 drams ginger, and follow up with a tablespoonful three times daily of equal parts of powdered sulphate of iron, gentian ginger, nux vomica and bicarbonate of soda. See that everything she is given to eat is of good quality and given in only reasonable quantities, and add to her drinking water one-puarter of its bulk of lime water.

UNTHRIFTY HORSE

"I have a horse eight years old. Last spring he weighed 1,500 pounds, but at the present time he weighs only 1,250 pounds. He has a very good appetite and he eats as much bedding as he can reach after eating his hay, but the feed does not do him any good. At plowing this fall he would go at it a fe wrounds, then he wouuld get very weak and almost refuse to go. He makes water four or five times during a half day's work. I will be much obliged if you would tell me the cause of the trouble and a remedy.—B.H., Thamesville, Ont."

The symptoms indicate nonassimilation of food. It is probable that his teeth are in such a condition that he cannot masticate properly. Have his mouth examined by a veterinarian and his teeth dressed if necessary. Mix equal parts of powdered gentian, ginger, nux vomica and bi-carbonate of soda and give him a heaped tablespoonful three times daily. He eats too much bulky food. Bed him with sawdust or shavings. Give him a limited quantity of hay of first-class quality, and feed liberally on rolled oats, with a feed of bran twice weekly. Also give a couple of carrots or a mangel or a turnip once daily, and give regular exercise of light work.



Deering Drills
for Good, Quick Planting

DEERING drills do away with delay at planting time. They have a workmanlike way of sticking steadily to business until the job is done that does away with most of the terrors of our short planting season.

Deering drills first make a furrow just deep enough, then plant the kernels regularly, according to the quantity per acre you want to sow, and then cover them thoroughly to an even depth. They are light-draft machines with strong frames, large, easily-filled grain and fertilizer boxes, and accurate double run feed. They are made in single disk and hoe styles with 11 and 13-furrow openers.

The **Deering** local dealer is the man to see when you are ready to look at drills. See his sample drills, or write to us for a catalogue showing all the good features of **Deering** drills.

International Harvester Company of Canada, Limited

EAST—Hamilton, Ont., London, Ont., Montreal, Que., Ottawa, Ont., Quebec, Que., St. John, N. B.

SCRATCHES—FEEDING HORSE

Veterinary Editor,—"(1) would you kindly tell me what is good for scratches?

"(2) What should I feed and how much should I give to a horse that is not doing very much all winter?—H.C.B."

(1) Purge horse with 6 to 8 drams aloes (according to size) and 2 drams ginger. Follow up with 1 to 1½ oz. Fowler's solution of arsenic twice a day for a week. Keep patient in dry, comfortable quarters and dress the heels three times daily with oxide of zinc ointment to each ounce of which has been added 20 drops of carbolic acid. If the heels become too moist, dress 3 times daily for a few days with a lotion made of 1 oz. each of acetate of lead and sulphate of zinc to a pint of water. The condition of the parts will indicate which should be used. Do not wash.

(2) A good ration in such cases would be about ½ lb. each of good hay and good straw for every 100 lbs. of the animals weight, and ½ lb. eacr of rolled oats and bran in the same proportions. This constitutes a day's ration to be divided into three carrots or a mangel or turnip once daily.

BLIND STAGGERS

"I have a mare 14 years old as good as ever, only she takes the blind staggers once in a while. I would like to know if there is a cure for it, or if there is anything I can give to stop them before they come on.—Subscriber.

This is usually caused by the brain becoming temporaaily affected as a result of digestive trouble. Purge her with 8 drams aloes and 2 drams ginger, and follow up with a dessert spoonful three times daily of equal parts nux vomica and gentian. Feed food of first-class quality and give a few roots daily. If constipation occurs give a pint of raw linseed oil. If poshearty meal. If working regularly, give no hay at noon, and little in the morning. Supplement the want of hay with an increase in the grain ration.

SCRUFFY LEGS

Veterinary Editor,—"I have a very valuable colt that has scruff on his legs, and he stocks up a little. Kindly tell me how to cure him. — Subscriber."

Purge him with 3 to 6 drams aloes (according to size) and 2 drams ginger, and follow up with 1 to 3 drams nitrate of potassium twice daily for four days. Make a solution of corrosive sublimate, 30 grains to a quart of water. Groom and brush the legs thoroughly two or three times daily, and once daily heat a little of the solution to about 120 degrees Fahr. and give the legs a thorough washing with it, being sure to get it well rubbed into the skin. Rub the legs well after washing and keep him warm and excluded from drafts until they are thoroughly dry.

POULTRY.

SPECIAL VS. SIDE LINE POULTRY PRODUCTION

(Experimental Farms Note.)

At this time when economical production is of first consideration, the question of whether production should be increased by encouraging the number of poultry farms or by increasing the flocks kept an farms and in backyards in the towns and cities, becomes of special interest.

Poultry Specialist

That the poultry specialist usually gets better results than the farmer, goes without saying. He gets better results because he has to; if he did not he would soon be out of business. He has nothing but his poultry to depend on; he must show a profit. It costs him so much more to feed his poultry than it does the farmer that hi sonly salvation is increased production. He must get it or fall by the wayside—one of the failures in the poultry business.

With the present high and ever ascending prices of feed, it is becoming more difficult for the specialist to show a satisfactory profit so that we must turn for increased production to sources where the feed problem is not s oacute. This brings us to the mixed farm where a flock is kept as a side line and to the town-dweller.

Farm Flocks

Every farm in the country should carry a flock large enough to make the best use of the unsalable grains, vegetables and waste milk. There are few farms that could not to great advantage carry a flock of at least one hundred hens. One member of the family —preferably one of the younger members— should be given full charge. Careful records should be kejt and all wasters promptly disposed of. In this way the production may be greatly increased without any corresponding increase in cost.

Most of the work is done by one of the younger members of the family. It will interfere very little with the general farm work. It will generally be necessary to purchase some feeds to supplement those available on the farm, but by so doing much of the lower grade products may be fed to produce a greater profit than if sold or fed to any other live stock.

The Back-yard Flock

The greatest hope for increased production at the present time lies in the back-yard flocks. There is no reason why every city, town and village should not be wholly or in great part at any rate, self-supporting from an egg standpoint. There are hundreds and thousands of dolars' worth of good feed thrown in the garbage pails every day. The waste going on even yet in our cities is simply appaling. The kitchen waste from the ordinary family of five or six people may be fed to best advantage to a flock of about twenty-five birds. This is more than many will want to keep, but a flock of this size will only require a house about twelve feet square—even a little less will do—no yard room is necessary and the eggs produced should keep the house supplied and still leave enough to sell to less thrifty neighbors, to pay for all the supplementary feeds which it is necessary to rpuchase.

What is more tempting to the appetite than an absolutely new laid egg from a flock that has been cleanly fed? Once used to home produced eggs, the consumer will never be content to depend on store eggs. If you don't believe this, try it.

Under present conditions, increased production should not be brought about by increasing the number of poultry farms, but rather by increasing the size and number of farm flocks culling closely, and keeping nothing but good producers and last but of primary importance—by the increase in number of back-yard poultry plants where flocks may be kept largely on feed that would otherwise be wasted.

POULTRY FEEDING

(Experimental Farms Note)

The problem of economical production, with feed at the present prices, is a question that has been worrying producers during the past few months. The question of what to feed is one that requires more careful consideration than ever before. Feed is high, hterefore the ock should be culled closely and nothing but the most vigorous birds retained. They should not only be fed heavily, but should be fed such feeds as llwi give results. For this purpose it is necessary to supply cereal, animal, vegetable and mineral feeds.

Cereal or grain feeds should form the principal part of the ration and for best results a certain proportion shrould be ground. The question is what are the best and most economical feeds to use. During ordinary times, a mixture of corn, wheat and oats is popular, but under present conditions milling wheat should be conserved for human food and only the lower grades used for stock feed. Lower grade wheat, oats and corn, buckwheat and barley these are all feeds that may be used to advantage. The extent to which each is used will depend on prices.

For ground feed, "Buckwheat screenings may be used to advantage, also mixtures containing bran, cornmeal, ground oats or other similar grains.

Vegetable or green feed is absolutely necessary to keep the flock in thrifty condition. It not only supplies succulence, but grain feed as well. Mangels turnips, cabbage, small potatoes or other similar waste products may be used to advantage.

Animal or meat feed is a form of food that poultry keepers frequently neglect supplying. It is not possible for a hen to produce eggs profitably on an all-grain ration. Sour milk is usually available on farms and no animal feed will give better results, as it not only supplies the necessary feed, but it also keeps the birds in good tone. If milk is not available, beef scrap, blood flour, green cut bone or similar feeds must be supplied to take the place of the grubs and insects which the birds get on range.

Mineral feed. Lime for the egg shells and mineral salts for the growth of bone must be supplied. Small quantities may be obtained from such feeds as clovers, but it is necessary to feed oyster shells or something similar to supply lime in sufficient quantities for a heavy egg production.

Sample Ration

Morning — A light feed of mixed grains scattered in a deep litter.

Noon—Green feed, mangels, vegetable parings or sprouetd oats.

Night—Full feed of scratch grains.

The scratch grains should be a mixture such as lower grade wheat, oats and corn,—barley, oats and corn,—barley, oats and buckwheat,—or whatever grains are cheapest at the time. So far this season, oats have been the cheapest grain food, so it is advisable to use them to as great an extent as possible.

The present indications are that corn will be greatly reduced in price. When this happens is should be used extensively, as, supplemented with a high protein feed such as sour milk or beef scrap, it is one of the most valuable of feeds.

Besides the foregoing, a hopper of dry mash, such as ground buckwheat screenings three parts, blood our or beef scrap one part, is kept constantly before the flock, also hoppers or oyster shell and beef scrap. If sour milk is available the beef scrap may be omitted or green cut bone may be supplied in the place of either. A good time to supply this is at the noon feed when a mash made from the kitchen scraps in which is mixed the green cut bone, at the rate of about one half ounce per bird and dried off with the meal mixture, may be fed.

Because feed is high in price, don't stint the flock. It takes a certain amount of feed merely for maintenance. It is only the feed over and above this amount that can be used for production, therefore feed and water liberally.

The BUCKEYE
Incubator Hatches More and Better Chicks
The STANDARD
Colony Brooder Raises Every Raisable Chick
Here's the Answer
Your country needs meat. The visible supply is very low. Poultry alone can be raised quickly.
The Buckeye Incubator and the Standard Colony Brooder make it possible also to raise poultry profitably always.
There's no guess work about it. Given good hatchable eggs, the incubator will always bring out the full number of healthy chicks. Put them under this brooder, and 95 of every 100 can be raised to a marketable size.
That's strong, but read why:
BUCKEYE The Perfect Incubator
STANDARD Colony Brooder
It's built up to a standard, not down to a price. It embodies all the experiences of 25 years' success. Its principles are recognized everywhere as correct, and its construction is perfect.
It is used by over half a million breeders — in the largest ranches and in the piano-box outfit of the beginner—and every user is enthusiastic. All the Agricultural Colleges and Experiment Stations endorse it. Success always accompanies it.
Our guarantee is simple, but look! Put a Buckeye in the same room with any other incubator. If it doesn't hatch more chicks and stronger chicks than any other, regardless of price—the first time you use it—we will take it back.
There's real reason for Buckeye superiority. We've put it into a striking new catalog, with a wonderful array of proof. Get that catalog! It means success with poultry! Write for it today.
Makes three chicks grow where one grew before, and removes the gamble from chicken raising.
Its use has ended the awful mortality of chicks, reduced operating costs for any number from 100 to 1000 to less than six cents a day; reduced labor to a fourth and hastened chicks to profitable maturity in less time than ever.
It's the most practical brooding device ever invented, simple, safe, sure, sanitary. Burns soft or hard coal, keeps fire 24 hours at one coaling, requires little attention. Write your own guarantee—we will sign it.
Our catalog will absolutely convince you of its wonderful results, told over their own signatures by delighted patrons, who have learned that there is such a thing as certainty in chicken raising, and who know that it is found in Buckeye quality and Buckeye service. Get that catalog today!

PRIZE WINNERS YORK-SUNBURY POULTRY SHOW, JANUARY 1918

Special Prizes

Best pen of Birds at show—Lloyd Johnston, North Devon—(Silver Cup).

Best female bird in open competition—Percy Morgan, North Devon.

Best male bird—J. N. Ferguson, Fredericton.—(This scored highest mark of anything on exhibition).

Barred Plymouth Rocks—Cock, 1, B. Goodspeed, Penniac; 2, Roy Kitchen, Fredericton.

Hen—1, 2 and 3, H. M. McMonagle, Fredericton.

Cockerel—1, Geo. Lockhart, Fredericton; 2, B. Goodspeed; 3 and 4, C. R. Willis, Nashwaaksis.

Pullet—1, H. M. McMonagle; 2 and 4, Chas. R. Willis; 3, J. E. Page, Fredericton.

Utility Pair—1, 2 and 3, Roy Kitchen.

Pullet, Mating Pen—H. M. McMonagle; 2, Roy Kitchen.

White Plymouth Rocks—Cock, 1, Walter S. Bailey, Fredericton; 2, Henry Simmons, Fredericton.

Hen—1, W. S. Bailey; 2 and 3, H. Simmons.

Cockerel—1, 2, 3, and 4, W. S. Bailey.

Pullet—1, 2, 3, 4, 5, and 6, W. S. Bailey.

Pen—1, W. S. Bailey.

Partridge Plymouth Rocks—Cock, 1 and 2, Henry Simmons.

Hen—1, 2 and 3—Henry Simmons.

A Big Egg Yield

ROYAL PURPLE POULTRY SPECIFIC

Royal Purple Poultry Specific is a great egg producer and poultry conditioner. It makes hens lay in the winter almost as well as they do in summer. This is because our Poultry Specific supplies the missing food elements that fowl need in their winter ration and without which they cannot lay. Royal Purple Poultry Specific tones up the digestive system, and keeps the fowl active and healthy. It should be fed daily in a hot or cold mash.

Royal Purple Poultry Specific

has pleased thousands of farmers and poultrymen. It has enabled them to get winter eggs without trouble. Read the views of the following users:

Fred E. Bond, Kincardine, Ont., writes:

"I have been feeding Royal Purple Poultry Specific to my hens this winter and I find it beats anything I have ever used as an egg producer. They started to lay right away and kept on gaining. I will never feed anything else as long as I can get it."

T. W. Hale, Toronto Annex, writes:

"I have fed your Specific to poultry, and it is a valuable tonic; increases the production of eggs. Would not be without it; keeps them in good health and I recommend it highly. Any person trying it once will not be without it."

If you want more eggs and healthier fowl, feed Royal Purple Poultry Specific. It is sold in large and small packages.

Ask our dealer in your town for it.

POULTRY NOTES

"Utility" does not mean "mongrelism" any more than "thoroughbred" means "standard-bred."

Fowls are obliged to throw off much of the waste of the body through the lungs. They do not sweat in the sense that do other animals, but instead breathe several times faster than sweating animals when heated. To keep in good condition of health, a hen requires nearly seven times the amount of froesh air in proportion to its size as does a horse.

There is almost as much difference between different families or strains of each breed as between the different breeds; therefore, receive with some allowance the praise or condemnation of any breed.

MORE EGGS!!

Poultry Owners all through Canada are getting more eggs from their hens than they used to. A little International Poultry Food Tonic in their feed every day will bring you more eggs and you will be in line to profit more by the high prices.

International Poultry Food Tonic

is a highly medicated preparation containing certain roots, seeds, herbs and spices which are absolutely essential to poultry. These ingredients stimulate the dormant egg-producing organs and will increase greatly the number of eggs you receive. The results are immediate and permanent. Sold at all dealers in 25c, 50c, & $1.00 packages. Write to-day for a copy of International Poultry Guide—FREE.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

THE SOLDIER

(By Andrew Edwards.)

He needs no tinsel on his coat,
No medal, star or braid;
No outward sign of rank or worth
To keep him unafraid.

The soldier carries in his breast
A living accolade—
The dear medallion of her face,
The noblest medal made!

Her faith, her hope, her tenderness,
Her human fear and pain
Are like a glory on her soul
To comfort and sustain.

In honor and in pride he goes
To face his duty grim;
Transplanted to himself, he feels
The heart that beats for him!

HOUSEWORK AS A BEAUTIFIER

It has long been said that housework and beauty cannot go hand in hand but it remains for the woman of 1919 to prove that she can do all her own housework and be as dainty and pretty as her next door neighbor who keeps a hired girl. It is quite unnecessary to have red, rough, unsightly hands because you wash the dishes three times a day or do the family washing, and so it goes with all the other household duties; they can be done so you are notlessbutmorebeautiful.

The girl who knows how to do her housework in a sensible manner will be able to broaden her chest, improve her complexion, keep down the pounds of flesh that cause her to ache with fatigue, beautify her hands and arms and receive the chance visitor with a radiant smile.

I hope the busy housewife won't smile incredulously at this and read no further, because I may be able to give her a few practical hints on the humdrum home duties.

In the beginning, make up your mind that you like housework, that you love to do this for your mother or father or perhaps your husband, remembering how many things they have done for you. If you get into this frame of mind you will give an extra shine to the kettles and an extra pat and smooth to the bedspreads. It's all in looking at things as they are and when you come to think of it, making a home is a pretty big thing to do and there is every reason you should be proud of it. Don't forget that.

"But," you say, "what about red hands with blisters where you hit them on the hot pan or tired backs from ironing and washing?" Yes. I know and that is what I am coming to.

Suppose we take up dish-washing first because that is something that comes three times a day and can't be avoided. There is a right way and a wrong way of washing dishes. You musn't bend way over until your back looks like the half of a barrel hoop. If you do this, it explains why you have such an aching back all day long. Try standing erect when washing your dishes, and be sure not to stand with all the weight on one foot. That gives you foot ache. Stand levelly on both feet.

To avoid putting your hands in the dish-water, use mops for washing the dishes. These can be made by taking a short stick and tying a mop of soft cloth at one end. With this you can wash everything but the pots and kettles.

I suppose of course as soon as you are through cooking you fill these utensils with water, so they will not be hard to clean. If you do this, you can easily clean them with a long-handled stiff cleaning brush and just as quickly as if you were soaking your hands in the greasy, soapy water.

One of the most convenient things I know of is rubber gloves for dish washing, window cleaning, scrubbing, etc. They are not expensive and will last for a very long time if you are careful not to cut them. Think what a diffcrence it would make in your hands! They would be soft and white and you could go out to entertainments without being ashamed of them.

With your hands so carefully protected, you wouldn't mind splashing around in water and giving every dish a littlc extra attention. For my part I love to wash and dry dishes but, of course, I see that my hands are taken care of.

It is easy to burn one's hands on the hot stoves or dishes, but I've found that a substantial dish-cloth hanging handy to the stove and careful covering up of the hands when taking dishes out of the oven, or stirring things over a hot fire, will keep your hands free from ugly, disfiguring burns and blisters. The only times I have been burned was when I was careless and not paying attention to my work.

Remember when scrubbing the floor to use the rubber gloves. You can clean the floor just as well so keep your hands white and soft.

Nowadays the long handled self-wringing mope are much used and they keep the floors clean, if plenty of floor soap is used and think what a saving to your back and knees!

When you are paring vegetables of fruit and find you have stained your hands, you can remove these marks by rubbing on a little oxalic acid. Your druggist will tell you how to use it. A slice of lemon will do the same work and is much cheaper. So you see you need not have stained hands, unless you want them.

Perhaps you have thin arms. Let me tell you a secret. Window-washing will develop them better than anything I know of, making them round and shapely, so that the new, tight-fitting sleeve can be worn without fear. Think of that!

Washing clothes is not considered a very desirable occupation but if you use plenty of water, soap and a wringer, and remember to place the tubs high, so you won't need to bend over much you will find it doing you more good than harm, as in this way your skin gets its weekly steaming. When the clothes are all hung out on the lines to dry, run into the house, wash off the perspiration with soap and water, masage in a little cream, fluff on some powder and see if your skin doesn't feel and look better for its steaming over the tub. As your hands are all puckered up from being in the water so long, rub them while wet, with cider vinegar and they will become smooth quickly. As soon as this is done rub in a little sour cream, slip on a pair of gloves made of drilling an dhie you away to sprinkle the clothes and begin your ironing.

This is not hard and if you have the windows open so you can breathe fresh air, your board placed high so you need not bend your back, it is really nothing but a pleasure. I know because I've done it.

Every girl or woman wants to have a pretty bust and broad chest and instead of telling her to take this or that I am going to ask her to—sweep. Sweep as the girl in the picture is sweeping, with back held erect, broom held firmly in both hands and a smile on your lips. Why, you can do as much more for bust and chest by sweeping as your heart could desire, but not unless you stand up. Sweeping with bent back and bowed-in chest will spoil your figure and ruin your health. Health is beauty, girls dear.

The hair to be pretty and easily dresed must be kept from the dust and so I think it is a good idea to make a dust-cap of heavy cotton cloth (muslin isn't thick enough, Miss Vanity) and put it on after breakfast is over, the dishes washed and dried and you ready for dusting, sweeping and making beds. You will find your hair comes out just as soft and pretty, after a regular orgy of dust, as if you had been gathering flowers in the garden.

When dusting the high mouldings and big pictures, never use a long-handled brush but have a small firm step-ladder. Climbing steps is mighty good exercise for the thick waist and the girl who wishes to have the long waist so popular now, should try dusting the high places standing on a step-ladder.

If the busy house-wife intends to take a morning for polishing the silver or polishing the range, she should first rub on her hands a generous supply of muton tallow, also fillingup the spaces under and around the finger nails. In this way the grease prevents the grim from filling the pores of the skin and a little soap and water will cause the hands and nails to come out perfectly nice, instead of one's having to rub the skin off with a nail brush.

As most working clothes are not beautiful, why not make your working dresses out of some pretty light brown or blue or of black and white calico? Get cheap washable stuff and make the dresses with plaited skirt, walking length, the waist buttoning up the back with short sleeves, simple blouse and low turn-over collar or no colalr at all, just a low Dutch neck? Make the drcss all in one piece with sewn-on belt. When working covcr with big apron and if anybody comes in unexpectedly throw off the apron and therc you are as neat and pretty as you can be. This dress is suitable for afternoon and evening also.

Daughter, SOUR STOMACH

Mother, FLOATING SPECKS BEFORE EYES

BOTH CURED BY

MILBURN'S LAXA-LIVER PILLS.

They stimulate the sluggish liver, clean the coated tongue, sweeten the breath, clean away all waste and poisonous matter from the system, and prevent as well as cure all sickness arising from a disordered condition of the stomach, liver and bowels.

Mrs. Joseph H. Therieau, Saulnerville, N.S., writes:—"I was troubled with a sour stomach, and took five vials of Milburn's Laxa-Liver Pills, and they cured me.

My mother also used them for floating specks before the eyes. They cured her also after having taken four vials. We both highly recommend them to all sufferers from liver troubles."

Milburn's Laxa-Liver Pills are 25c. per vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

ar, egg well beaten. Sift B. P. with our, add to first mixture, alternately with milk. Bake in muffin tins in quick oven.

Stewed Prunes—½ lb. prunes, ½ c. sugar, 3 c. cold water, 1 tbsp. lemon juice. Wash prunes in warm water and soak over night or several hours in cold water. Cook slowly until tender in the water in which they were soaked, add sugar and lemon juice and cook 5 min. This is a general method for all dried fruits.

Cereal Coffee—Two parts bran and one part middlings, mix with enough molasses to moisten. Bake in oven until crisp. Use as ordinary coffee.

French Toast—1 egg, 1 c. milk, ½ tsp. salt, 6 or 8 slices bread. Beat egg add salt and milk, dip the bread in the mixture. Have a frying pan hot and well buttered; brown bread on one side, place a small piece of butter on top of each slice, turn brown on other side. Serve hot with cinnamon and sugar if desired.

Barley Scones—Sift together 1 c. each of barley and wheat our, ¼ tsp. soda, 4tsp. B. P., ½ tsp. salt and 2 tbsp. shortening, then mix to a dough with 1 c. thick sour cream. Turn on our board, roll in a sheet ½ in. thick, cut into diamond shapes and place in buttered pan. Brush over with sweet mlik, dredge with sugar and bake in quick oven. Split the scones, spread one half with butter the other half with jam or marmalade and press the corresponding halves together. Serve hotwith tea, coffee or cocoa.

Egg and Rice—1 c. boiled rice, 1 tbsp. butter, slice of onion, ½ c. rich milk, 3 eggs, salt and pepper. Put butter and onion in pan and fry for a few minutes, add rice then egg beaten and milk added. Cook until egg is cooked. Serve hot.

Cornmeal Muffins—1 c. cornmeal, ½ tsp. salt, 1 egg, ¼ c. our, 2½ tbsp. sugar, ½ tsp. soda, 1 c. sour milk. Mix and sift dry ingredients, add milk and egg then melted butter. Bake in quick oven about 20 minutes.

Bran Drop Cakes—1 egg, ¼ c. butter, ½ c. brown sugar, ¼ c. milk ½ c. molases, 1½ c. white our, 2tsp. B. P., salt, 1¾ c. brna, 1 c. raisins, chopped, ¼ tsp. soda. Cream butter and sugar together add beaten egg, molasses, mixed and sifted dry ingredients, except bran, alternately with milk. Add raisins then bran. Drop from spoon and bake in hoderate oven.

PARENTS WHO DO NOT VISIT SCHOOL LOSE OPPORTUNITY

Every parent who has a child attending school should make it a point to visit their school at least once during the term, and several times if at all possible. Interest centres just now in the war, in farm problems, etc., but there is no problem—no question of more vital importance than the training of the children.

Parents are too often disposed to allow their boys and girls to attend school year in and year out without so much as calling to make enquiry concerning them, or to visit their schoolrooom to ascertain how their development is progressing. The children are no doubt in good hands, but schools progress as they should only when parents take an active interest in them.

There are certain laws to which the training of teachers must conform. There are credentials which every teacher must have. There are qualifications which he must possess, yet none of these things can take the place of a parent's actual co-operation with the teacher himself.

No parent means to be careless concerning this great matter, but many are. They tell themselves that they have no time to spend in the schoolroom, thereby placing dollars and cents above the welfare of their own flesh and blood.

As a matter of fact, most of the teachers are competent, and most of the schools are well equipped, but these do not take the place of one's own personal interest in either teacher or school. The teacher welcomes this interest. He can do better work where parents are taking active interest by an occasional visit to his school than where their rather bored indiffference makes his position that of a stranger. He knows that his reputation as a teacher depends largely upon the opinion which parents form of him and he would much rather they received their knowledge at first hand.

Furthermore, there are often questions that arise regarding expenditures, and the average parent is inclined to view all new departures as a waste of money and time. He should see the conditions under which his boys and girls work before forming a set opinion, and try to realize that time does move, thereby recognizing the need of a better and more efficient training that the future will undoubtedly make necessary. Competition is becoming greater and life more demanding in its requirements.

The children, too, will appreciate the fact that their parents are sufficiently interested in their work and environment to call upon them, and they will makes a greater effort to please both parents and teacher. It takes but a little time, and a parent will be warmly welcomed in the schoolroom, and his interest will be the means of that school's growth and development.

There are many, many ways to keep the children well, happy and interested in school work. The parents and teachers should more often plan and work together, and in most cases the child who shows a distaste for learning can be redeemed, if both parents and teachers are quick to see the need, grasp the opportunity, and take the initiative.

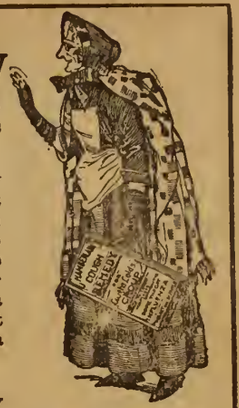
PROLONGING THE LIFE OF CLOTHING

In these times when there is a shortage not only of food materials, but also of textile stuffs, the woman who can clothe herself and her family at a minimum expense is "doing her bit" just as much as the woman whose garbage can fills slowly or the man who makes two potatoes grow where none grew before.

Many articles of clothing that in ordinary times would be discarded without a second thought may, with a little care, be freshened up and made to serve another period of usefulness.

Wooien goods may be satisfactorily cleansed by washing in warm water with soap solution or soap bark. Soap bark is prepared for use by letting five cents' worth stand in two quarts of water for an hour and then straining it into lukewarm water in which the material is to be washed. Water of the same temperature should be used

Good for the whole family



A good cough remedy is one that can be depended upon to cure coughs. Not one that cures some particular cough, but coughs in general.

While the causes of all coughs are primarily the same, yet the condition of the patient is what makes the difference in the nature of the cough itself. Coughs of healthy persons are easier to cure than the coughs of invalids. The more powerful convulsive cough of a big man is harder to cure than the cough of a baby. If you get a remedy that will cure a big man's cough and yet not be too powerful for the baby, you have a good cough remedy.

Chamberlain's Cough Remedy

"Granny" Chamberlain

is just this kind of remedy. It is good for any member of the family. It relieves coughs of all kinds. It is composed of things which cure easily and soothingly without harming the delicate tissues of the throat, and is the ideal remedy for coughs, colds, croup, influenza and whooping cough.

Yours for Health —Granny Chamberlain.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

HEADMASTER

CALENDAR SENT ON APPLICATION

for both washing and rinsing. Press woolens when almost dry, on the wrong side, with a warm iron.

Most grease spots may be removed with naptha soap and warm water. Chemical or dry cleaning will remove grease spots by dissolving the fat. The cleansing liquid may be ether, chloroform, carbon tetrachloride, gasoline, naptha, or benzine. The last three should be used in the open air if possible. They must be used away from a fire or a flame of any kind.

On silks or satins, rub the grease spot with a thin paste made of benzine and carbonate of magnesia. The benzine evaporates and the magnesia will absorb the grease and can be brushed ffo. Very often dry French chalk or powdered magnesia alone will absorb the grease, several applications sometimes being necessary. A warm iron and blotting paper will remove some grease spots.

ANTIDOTES FOR POISONS

The most common poisons used about the farm at this time of the year are those contained in the common insecticides and fungicides. Below are the commonly prescribed antidotes for such poisons:

FIRST: Send for a physician.

SECOND: Induce vomiting (except in cases where caustics have been swallowed) by tickling throat with finger, or drinking hot water or strong mustard and water. Soap suds is commonly effective as is also common salt. After vomiting give sweet oil (olive oil, cottonseed oil), and then,

THIRD: Aply the appropriate antidote, if the kind of poison is known, as follows:

Carbolic acid, creosote, lice killer, etc.

Give Epsom salt (magnesian sulphate), or Glauber's salt (sodium sulphate), one ounce to a pint of water; then induce vomiting if possible or use the stomach tube and give olive oil or milk. Use alcohol, then water, for external burns. Diluted alcohol may be used internally if the salts cannot be had.

Copper: in Paris green, copper sulphate, blue vitrol or bluestone, Bordeaux mixture): Treat same as in case of Arsenic.

Copperas: (ferrous sulphate, green vitrol): Strong tea, soapsuds.

Lead: (in lead arsenate, sugar of lead): Treat same as in case of Arsenic. Epsom salt is also effective.

The Doctor Did Not Do Her Lasting Good

SO MRS. JOS. ROGER USED DODD'S KIDNEY PILLS

Popular New Brunswick Teacher Tells What Splendid Results She Got From Dodd's Kidney Pills.

Elm Tree, Gloucester Co., N. B.—Feby. 4th (Special.)—"When the doctor I consulted failed to do me any lasting good I decided that my kidneys were the root of my troubles, and made up my mind to try Dodd's Kidney Pills.

"You may judge of the results when I tell you that I have not lost a day's work as teacher during the past year."

That is the statement of Mrs. Jos. Roger, the well-known and popular teacher here. Just how ill she was before using Dodd's Kidney Pills is best told in her own words.

"My trouble came from a strain," she says, "and I suffered for thirteen months.

"Backache, heart flutterings, sciatica, neuralgia, nervousness, dizziness, and failing memory were among my symptoms.

"I took 12 boxes of Dodd's Kidney Pills in all, and I can say for them that they have done me all that was claimed for them."

If you have any of the symptoms that troubled Mrs. Roger, ask your neighbors if Dodd's Pills are not the remedy you are looking for.

NOVA SCOTIA FARMER'S ASSOCIATION

(Continued from page 251)

repairs which will prevent the larger amount of unnecessary work that must be done when these are not attended to. This Association also suggests that employees working at Highway Labor shall receive their wages in weekly payments.

Moved by Walter Churchill; seconded by Wm. O'Brien.

* * *

Whereas the Government is urging our farmers to increase production of beef and pork, and,

Whereas the farmers are willing and anxious to produce all of these products possible, and,

Whereas the feeds required to grow and fatten those products is scarce and difficult to obtain,

Resolved that the N. S. F .A. in Annual Session assembled ask the Federal Government to give cars of feed coming into our province precedence over all freight excepting munitions and other war materials, thereby giving us a more steady supply of feeds.

Moved by F. W. Foster;seconded by Wallace Rhodenizer.

* * *

Whereas in different parts of the province farmers are rapidly becoming organized into co-operative companies for the mutual benefit of its members, and,

Whereas their interests are identical with those of the Provincial Farmers' Association we feel that it is only just that they should have representatives in this body and would recommend that we express our willingness to accept representatives from theirs on the basis of one representative from each co-operative association of one hundred members or less and in no case more than two representatives from any one such organization.

On Thursday afternoon Prof. M. Cumming gave a practical talk on the seed and fertilizer situation and strongly urged the necessity of procuring supplies without delay.

A short discussion lead by Walter Churchill on "The Road Law and Good Roads" followed by votes of thanks to the retiring president for the manner in which he had looked after the affairs of the Association during the year and to the Municipal Council for the use of the Court House where the meetings were held.

Extracts from some of the addresses will be published in the columns of the Maritime Farmer.

FERTILIZERS FOR 1919

It is well that the New Brunswick Agricultural Societies take stock of the requirements of their members for fertilizers for 1919. It is not too early to begin. The fertilizer situation has been a source of speculation for some time past. The indications are that there will not be any great improvement in the supply during the coming twelve months. Therefore, every agricultural society should prepare to meet the situation.

It is a matter of regret too, that the excellent work done by the New Brunswick Agricultural Societies United has not won more hearty support. It is estimated that 40,000 tons of fertilizers are used in New Brunswick each year. Of this amount not more than one sixteenth has been furnished by the Agricultural Societies United. This means that hundreds of farmers are paying more for fertilizers than they need. By co-operation and having their society handle the bulk order they can save dollars for every ton they buy in that way. If you are a member of an Agricultural Society and the organization is not taking an active interest in supplying fertilizers co-opertaively, see that it gets busy and becomes an active participant in the movement. Every Agricultural Society in New Brunswick sould be a member of the New Brunswick Agricultural Societies United. The membership, as fixed by law, is five dollars but the advantages are many times that amount when measured in cold cash savings to farmesr. Societies requiring information should write the Secretary, James D. McKenna, Sussex. New Brunswick.

The time-saving secret of Gold Dust

What makes dirt stick and stick and stick? Grease! What dissolves the grease and saves household time? Gold Dust!

Proof? Test Gold Dust on some greasy dishes. See if you don't actually save time.

But Gold Dust saves more than just dish-washing time. In fact, thousands of women save time all through the day by following this rule: "Use Gold Dust for all dirt you can't brush up or sweep off." Such as—stains on woodwork, grease spots on kitchen floor, grease or oil on clothes,

But remember: For Gold Dust results be sure it is Gold Dust you really get. For sale everywhere in large and small packages.

GOLD DUST

CONSERVATION OF BARN YARD FERTILIZER

(Continued from page 254)

that we specially recommend, for by this means the value of the resulting manure is enhanced without any hindrance to the exercise of the other useful functions of this amendment subsequently in the soil."

"An application of Gypsum is valuable to lands affected by 'black alkali.' The sodium carbonate which such soils contain not only asts directly as a corrosive chemical, cutting into and eating away the plant tissues (especially at the immediate surface of the soil) but it acts most injuriously on the physical condition of the soil, puddling it and making it impervious and causing it on drying to form hard, refractory masses. The application of land plaster converts the carbonate of soda into sulphate of soda, a milder form of alkali as regards vegetable life and one less prejudicial to the physical condition of the soil."—H. P. Timmerman.

APPLE SPRAYING

(Continued from page 250)

The Spray Gun

I cannot finish without a reference to the spray gun. It is the most valuable labour saving device that I have yet seen for the application of spray. In my own orchard I know that one man and a boy could put on 75 per cent. more spray and do a better job with the spray gun than two men and a boy could with the old bamboo rods. After the first spray particularly, when applying the lime and sulphur with the gun, do not stand close to the tree and spray up but get a long way off, preferably on top of the tank and spray down so as not to get the lime sulphur on the under side of the leaves.

In closing I must remind you that every winter for the past three years things have looked gloomy for the apples and every year our pessimists have amused themselves painting word pictures of blue ruin for the apple. Every year you have, on the whole, taken a chance and sprayed your trees and every year you have been rewarded with prices far in excess of what you expected. You know the position that Nova Scotia will occupy in the apple industry if, when the war is finished, our apple orchards are in good condition. I think that is all that it is necessary to say.

SOME PHASES OF THE AGRICULTURAL WORK FOR 1918 IN N.B.

The Greater Production Campaign must be given careful atention until every farmer is canvassed and seed is supplied to all requiring it, but the other activities that belong to a Department cannot be neglected except at a loss to the country which ultimately would mean a decrease in the general production throughout the province. Some agricultural work will be undertaken that is some what new in the province and other activities will only be speeded up.

Co-operative Marketing of Wool

Wool in the past was sold for whatever it would bring upon the local markets. No attention was given to the marketing because very few understood the requirements of the woolen manufacturers. Investigation revealed that under a proper system of grading the wool could be made worth more to the manufacturer and at the same time a great deal of educational work would be done and more dollars placed in the pockets of the farmers. The producer and consumer could be brought to gether. Under this system the producer receives the face value of his wool according to quality. Good returns can be had by caring for the sheep properly, by adequate feeding and housing and giving thought to the breeding. Every sheep owner will be given the opportunity to put his wool through a grading station next summer. About 200 meetings will be held throughout the province where this problem and the sheep industry will be discussed. Agricultural Societies will receive particular attention and where none exists and the farmers are willing, small organizations will be formed through which the Department may work. The grading stations will be at Fredericton and Moncton.

What Will It Do For Me?

YOU have heard of the great good this food cure is accomplishing for others. You have come to realize that nervous diseases do not right themselves, and therefore feel the necessity of some treatment to help you back to health and strength.

Now comes the all-important question as to what Dr. Chase's Nerve Food will do for you.

Basing our answer on a knowledge of the restorative value of the ingredients contained in this food cure, and on the experience of those who have proven its curative powers under the most trying conditions, we want to tell you that—

It will make your blood rich and red.

It will nourish the starved nerve cells back to health and vigor.

Mrs. C. French, 104 Lansdowne street, Peterboro', Ont., writes: "I was troubled with nervousness, sleeplessness, frequent headaches and indigestion. For many years I was troubled with a twitching or fidgety feeling about my limbs after retiring, causing me much loss of sleep. If wakened out of my first sleep, even had I been asleep only five minutes, I would lie awake for hours and could not get to sleep again. Any sudden noise or a door slamming would set my nerves going, and I would fear that something dreadful was going to happen. I had tried different remedies for this trouble, but without success. A friend asked me one day why I didn't try Dr. Chase's Nerve Food, so I thought I could at least give it a trial. I secured some and commenced using them, and found they benefited me so much that I have taken fully a dozen boxes. My nervousness or fidgety feeling in the limbs is entirely cured. I can now eat and sleep well. I can recommend Dr. Chase's Nerve Food strongly, and would advise anyone suffering from nervous trouble of any kind to use them according to directions."

It will cure nervous headaches by removing the cause.

It will strengthen the action of the heart.

It will correct the weakness and inactivity of the digestive organs.

It will restore energy, ambition and confidence.

It will prevent the development of nervous prostration, paralysis and locomotor ataxia.

Why not put Dr. Chase's Nerve Food to the test? We know that the formula is right. We have proven to you by thousands of reports from cured ones that this treatment positively effects cure, even in the most complicated cases.

We cannot do more. It remains for you to make the test. You have everything to gain by using this building-up treatment, for it cannot fail to be of at least some benefit to you.

Dr. Chase's Nerve Food

50 cents a box, a full treatment of 6 boxes for $2.75, at all dealers, or Edmanson, Bates & Co., Limited, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

[illegible] paper, twine and shipping tags [illegible] by the Department [illegible] eived at the [illegible] and a receipt [illegible] shipper together with a [illegible] t least 75% of the full value of the wool. The wool in the grading stations will be insured. The Dominion Department of Agriculture will supply a competent grader. The wool will then be offered for sale and immediately the returns are in, every farmer will receive the final payment on the wool together with a statement showing how the wool graded.

An effort will be made to prevent the sale of lambs until they are ready for the market. The system of selling lambs at an early date is detrimental to the industry financially, and has no educational features to recommend it. Every man should endeavor to place a finished product of high quality upon the market and the system of early selling which is in vogue in some parts of the province does not induce the production of such animals.

Perhaps no other endeavors will do as much to arouse keen interest in the raising of sheep as the two above mentioned activities and it is acknowledged by all that this province should carry far larger numbers of sheep of much higher quality.

Pure Bred Sires

The scrub sire is one of the greatest drawbacks to New Brunswick's livestock industry. They cause deterioration in the livestock, low quality unthrifty animals, poor prices, engenders lack of interest and gives no encouragement to any man to concentrate attention and care and too often leads to dissatisfaction and a miserable slip shod system of animal industry. There would be many thousand more farmers in the province today if the scrub sires had been replaced years ago by pure breds. A lively interest in stock cannot be maintained except there is excellence in the animals.

Who is there that can be proud of a non-de-script stallion, that cannot claim type, beauty, quality strength, masculinity or many of the other outstanding points earnestly sought for by our foremost breeders? Who can be proud of a little scrubby bull picking its living upon the highways of the province, not of sufficient importance or of value to warrant ordinary care? How large is the loss to our farmers every year by breeding to sires because the fee is small? Why have other sections outstripped us in the production of sheep, cattle and horses? Why are we forced to go to other provinces for our supplies of pure bred breeding stock? The scrub sire must bear the blame. Not only has the scrub sire replaced the pure-bred but he has lowered the standards of the pure breds in the province because the market for good animals has been depressed.

However, New Brunswick is not the only sinner in this regard—every province has its share, but we have too large a share. Until the pendulum swings the other way every effort will be put forth by the Department to eliminate the scrub sire and replace him with a pure bred.

The importance of pure bred stock will be encouraged, more especially sheep and dairy cattle. Last fall about 1200 breeding sheep were handled and if reports are criteria, far more will be necessary for 1918. Enquiries for dairy cows are coming in and the importation in our lots is anticipated.

Moncton Co-operative Creamery

The farmers in Albert, Westmorland and Kent Counties have decided at the suggestion of the Department of Agriculture, to manufacture butter in a co-operative manner at Moncton. Stock has been subscribed, organization affected, a site secured, supplies ordered, manager engaged and a general scheme for operation has been outlined. Much work has to be done in the organization for cream shipping and in the instruction necessary for the care of cream. The educational efforts will be undertaken by the Department insofar as required.

Stallion Enrollment

Last season an effort was made but it was taken up at too late a date to have the desired effect. Every stallion that is to be travelled will be inspected before the season opens and any stallion owner travelling an uninspected stallion will have to be prepared for the cnosequences. Here again the scrub sire is to be given his proper rating and ultimately his place will be taken by a pure bred. It may take a few years to accomplish the movement. Definite inspection points and dates will be named.

Pruning Campaign

The great scarcity of labor is accountable for many orchards failing to bear a large crop and to overcome this an arrangement has been thrown open to the orchardists and as a result many orchards are now pruned. The Horticultural Division sends out competent pruners who are paid a flat rate by the farmers for the actual hours worked and they also have to duplicate the amount of time put in by the Departmental men. They also agree to spray and take proper care of the orchards throughout the summer.

Strawberries

A partial survey has been made and will be completed next spring. An effort to avert the gluts will be made. This is a very difficult undertaking because the date of ripening in the province is compared to other influences very largely the opportunity to export. However the effort will be made.

Bees

No one can estimate the loss this province has borne because the bee industry is not flourishing. Tons of honey was wasted due to dearth of collectors. Honey is an excellent food and could well be used in all houses every day. A campaign was commenced last summer and will be energetically followed up. There are about 300 bee-keepers that have been located. Every man will be visited. Many fruit growers are requesting assistance; where bees are kept invariably the crops of fruit have been better. The possibilities of this industry are almost beyond comprehension.

Boys' and Girls' Clubs

Club work will be encouraged. On January 2nd the staff of the Department met and plans for all the work were discussed and arranged. In every county there will be one or two boys pig clubs. These will consist of ten members each and every member will be given a pure bred sow pig under regulations which he agrees to fulfill. Careful records will be made. In every county within a couple of years there will be at least ten breeders of purebred pedigreed pigs who will be distributing breeding stock to their neighbors. These clubs are financed by public spirited men in every county.

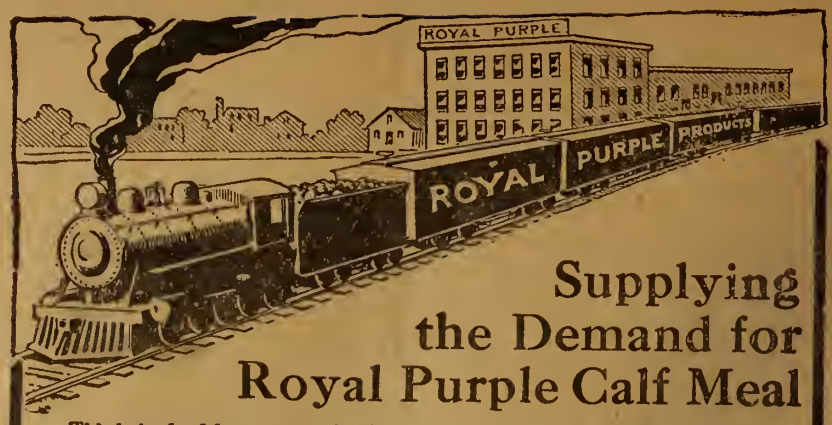
The Poultry industry will be attacked in a similar manner. Boys and Girls will be formed into clubs and 50 eggs given to every member under regulation. The eggs will be carefully selected in order that through the boys and girls a foundation for utility poultry may be properly laid. Every chick will be identified and all records will be kept at the Department of Agriculture, in addition to the forms until a sufficient number are had, which are sonsidered superior utility birds to form the foundation of an organized industry. The fattening of poultry will also be encouraged by the clubs.

It is intended that the young people be encouraged to raise good stock and more of it an dalso that the marketing be done in the proper way. In no case will pigs or eggs be given without something in return from the club members.

School Fairs

School Fairs have been held in a few places but next fall it is intended that a few more be held and that this and the club movement be brought together at the School Fall Fair. It is quite within reason to anticipate a fair when there would be 500 chickens.

Every bird or animal exhibited at the School Fair which has the necessary quality, type and substance will



Supplying the Demand for Royal Purple Calf Meal

This baby food for young animals is partially pre-digested, and can be fed to the youngest animals with perfect safety. It WILL NOT cause stomach or bowel trouble, which are serious ailments in young animals. Royal Purple is a sure preventive for scouring.

Calves Gain Rapidly Without Milk

When the calves are 3 or 4 days old they can be fed Royal Purple Calf Meal and raised just as well without one drop of milk. What prominent breeders remark:

Mr. Geo. W. Collins, Plainfield Ont., writes:

"Gentlemen,—In regard to your Calf Meal, I think you have the best on the market, as people who have bought it give it great praise. Some have taken their calves off sweet milk, and feed them nothing but your Calf Meal and water, and say they are doing as well on it as they did on the whole milk."

To Whom It May Concern: Uxbridge, Aug. 5th

This is to certify that I have secured your Royal Purple" Calf Meal from our druggist. Mr. T. C. Nicholls, of Uxbridge, and can speak of this meal in the highest terms. I have used other calf meals, but this one is the best I ever tried. I never saw a calf gain more rapidly and thrive better than mine did while using your "Royal Purple" Calf Meal. I can cheerfully recommend it to all our stockmen who wish to raise large, healthy calves."—Stanley W. Croxall.

Note—The above Mr. Croxall keeps a large herd of pure-bred Holstein cattle, and is an excellent authority on Calf Foods.

Royal Purple Calf Meal is equally good for young colts, lambs and young pigs. Put up in 25-lb., 50-lb. and 100-lb. bags. Secure it from our dealer in your town.

W. A. Jenkins Mfg. Co., Ltd., London, Can.

Send for our 80-page book which describes the common diseases of stock and poultry; also methods of feeding and our many products. Get a copy to-day.

Seed Grain--1918

Good Seed is scarce—Place your order now with your County Councillor.

The Department of Agriculture has ordered wheat and oats through the Seed Branch, Ottawa. The germination is carefully tested.

The seed is now stored in the elevators at Quebec, thus avoiding transportation difficulties and guaranteeing delivery.

The Department requested the co-operation of the County Councils in this distribution. Seed will be forwarded at their order in car lots, thus avoiding local freights and much handling.

Wheat will cost about $3.00 per bushel in bags laid down.

The Seed Branch is yet unable to fix the price on oats. Definite prices will be stated in this space immediately they are at hand.

New Brunswick is expected to bread herself for the duration of the war. Every farmer should grow some wheat.

Agricultural Societies should arrange orders early.

Send all orders to the County Councillors immediately.

New Brunswick Dept. of Agriculture

Better Crops Result from Spraying

This Knapsack is ideal for spraying small plots of potatoes, shrubs and all small fruits. It is strongly made, powerful and easily operated. We make the SPRAMOTOR in a size and style for every need—operated by hand, horse or gasoline power. Prices range from $7 up to $400.

Made in Canada—No duty to pay

Send to-day for our Free book on Crop Diseases and Spramotor Styles.

THE LONDON SPRAMOTOR, 5031 King St. East, London, Canada

be exhibited at poultry or fall fairs by the boy or girl under supervision of the Department of Agriculture.

These co-operative efforts will be made demonstrations of what can be done and nothing will be left undone to have the impressions indelibly stamped upon those who attend. The boy and girl must be given attention and agriculture will undoubtedly fare well under their direction.

There are several other phases of the work which will be carried on but cannot be touched upon here.

DRAINAGE OF FARM LANDS

In view of the importance of increasing the productivity of the land and the food resources of the Dominion, and the difficulty of so doing in face of shortage of labor, seed and fertilizer, little seems to have been published as to the effect of drainage, upon which all authorities are agreed, and the cost of which is represented by an interest charge far below the value of the result actually achieved. Further, these benefits do not, as in the case of increased area of cultivation involve additional expenditure for seed or fertilizer of even of labor beyond the first installation.

Drainage of farm lands in the East is of even greater importance than irrigation in the West. As has been set forth in Agricultural records, drainage does four things:—First, it removes in a wet season the surplus water and makes it possible to cultivate the land and get in the seed about three weeks earlier than on the same land when undrained. Secondly, it makes the land from 10 to 15 degrees warmer than if not drained, and this warmth promotes germination and early ripening of both grain and vegetables, also it tends to avoid rot amongst potatoes and root crops. Thirdly, it lets plenty of air down to the roots of the plants, which is necessary for satisfactory growth. Fourtbly, it makes the soil more porous and this in turn causes the soil to absorb and retain moisture for the use of the crops in time of draught instead of becoming so baked and hard as to lose the same by evaporation or surface flow. Frequently the increase of crop in one or two years pays the whole cost of the drainage, and seldom takes longer than four years, so that drainage easily returns 35% to 50% per annum on the money invested.

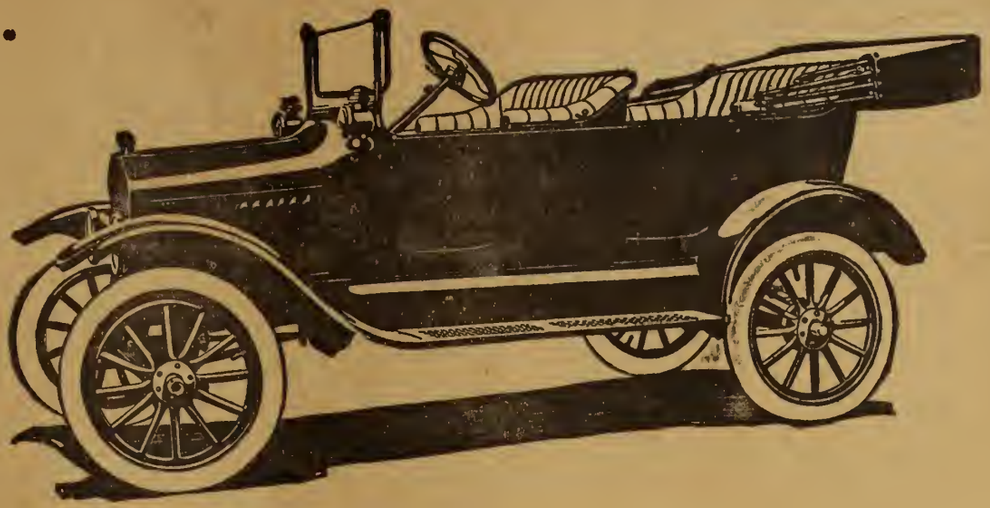
Better cultivation, seed selection and all the other steps in this direction as taught by our Agricultural institutions are based upon this the first one of soil improvement, and are of little avail without it, and soil improvement is intimately related to proper drainage.

Fortunately so far as Eastern Canada is concerned it has been demonstrated that field tile may be made from almost any kind of clay that does not crack too badly in drying and which is free from pebbles. Limestone particles are reduced to lime oxide in burning, these afterward absorb moisture swell and crumble the tile. Also, it is shown that a superior tile is produced from shale used in the manufacture of building brick and a mixture of clay and shale as well as sand is recommended according to texture, the object being to produce a plastic material that will flow smoothly through the die and in which the green pipe may be handled easily without damage and in which the drying qualities are good and shrinkage not too high. A strong cheap pipe likewise may be obtained from cement and sand and as porosity is not essential water entering into the pipe line at its frequent open joints, this or a glazed tile is equally serviceable to the porus surface clay tile. Most all hard tile will stand transportation and handling fairly well.

Supplying drain tile to such localities as have heretofore done little, if anf drainage work, is a matter more of arrangement of distribution than one of the cost of the commodity itself, providing, of course carload shipments are handled. But seldom, if ever, does any farmer require so much as a carload at a time and the absence of a reasonably accessible supply of drain tile means that the business is non-existent. Under these conditions every produce warehouse or freifht shed where farm goods are received from teams should be provided with a quantity of drain tile to be worked off in small quantities as return loading to the farm and on account as between the warehouseman and the farmer.

Every honest device should be employed to push the sale and use of farm tile, that an improvement which is only in its inception may have rapid growth permanently, benefitting both the producer and the consumer of farm products the more as it expands by force of example throughout the whole eastern territory and in a form which involves no additional cost after installation, a quite different effect than that produced by increasing the area of cultivation alone.

In the province of Ontario where an act of Legislature permits of financial assistance being given by municipalities toward the drainage of farm lands, the Provincial treasury advances funds to cover debentures issued for the amount of work approved by the municipal council upon a survey, plan and estimate furnished by a competent inspector of drainage, seventy-five per cent. of the cost of the improvement, but not exceeding one thousand dollars in any one instance, being advanced by the municipality upon the completion of the work. Interest is charged at the rate of five per centum per annum upon the sum advanced, the owner of the land which is so improved, agreeing that such principle and interest shall be added to the municipal taxes thereon in ten or twenty annual payments. This, he is well able to do, as the first



A Ford Car Takes the Place of all These Things

WHEN you own a Ford you can do away with many articles that are a source of continuous expense to the man who still drives a horse. For instance, not only your driving-horse and buggy, but the single harness, blankets, whips, currycombs, brushes, horse-shoes, pitch-forks, feed-bins, etc.

In their place you have a speedy, dependable, dignified, roomy Ford Car—complete in itself. It is vastly superior to the narrow, cramped buggy that travels so slowly. And when a Ford is standing idle it does not eat three meals a day, and it requires no "looking after."

A Ford will save you time, trouble, and money. It is the utility car for the busy farmer and his family.

Advertise in the FARMER

seasons return is as good as 25 per cent of an increase in crop from that particular land, which carries the burden of cost and by this method the farmer who is in need of financial assistance is not called upon to assume a high rate of interest, and in event of selling the property before full payment is made, the burden of cost of the improvement remains therewith. Along with this system, which shows the Government to have implicit confidence in the result of its own teaching, there is in every Ontario town of consequence, someone who carries a stock of farm tile so that it has become an almost automatic proceeding on the farmer's part to load up a quantity of drain tile on his way home, and next lull in farming operations sees the tile put into the ground, and so without any large expense or wasted effort the system of drainage is completed in a comprehensive way according to the plan laid down by the Engineer as to levels, direction of flow, size of tile used for mains, branches, outlets, etc.

The other provinces already have made considerable of an advance toward the encouragement of farm drainage by the loan of ditching and tile making machinery, and this policy so far as it goes has been favorably commented upon by those who are in a position to observe the result of operations carried on. Should they go still further and assist as in Ontario, the method of financing farm drainage upon the security of the improvement when vouched for by municipal authorities, the same already having passed the experimental stage in that province, it would undoubtedly prove equally "good business" elsewhere.

Four things a man must learn to do
If he would make his record true:
To think without confusion clearly;
To love his fellow-man sincerely;
To act from honest motives purely;
To trust in God and heaven securely
—Henry Van Dyke.

STRAWBERRY PLANTS !

We again offer to the strawberry growers of the Maritime Provinces a wide range in varieties of well grown, true to name strawberry plants. We have Senator Dunlaps, Glen Mary, Haverland, Bubach, Buster, Sample, Arnout, Wm. Belt, Warfield Williams, Dr. Burrell, Early Jersey Giant, Kellogg's Prize, Kellogg's Premier, Portia, Progressive and Frances.

Write for our free Catalogue with description of varieties and price list.

CYRUS & MANNING ELLS
Port Williams - - Nova Scotia

FOR SALE !

We have for sale a breedy, growthy bunch of young Shorthorn bulls, different ages, most of them are bred very strongly along milking lines, yet they would be a credit to any beef herd.
would be a credit to any beef herd.

We are booking orders for spring delivery of our large English Berkshire young pigs. Not the short chubby type, but the lengthy, growthy and large.

Prompt Shipments Assured and Quality Guaranteed

Manufacturers, today, are laboring under difficulties, because of the scarcity of materials, shortage of labor and delays in transportation.

Notwithstanding these difficulties, we are able to assure good service, and can make prompt shipments of telephones and telephone materials.

We are maintaining the same high standard of quality in our telephones as we did before the scarcity of materials developed. The instruments we are making today are fully capable of sustaining our reputation as makers of the highest class telephones.

Everything we sell is guaranteed, and we carry everything required for equipping a complete telephone system, no matter how large or how small.

We are the only INDEPENDENT company manufacturing telephones in Canada for the INDEPENRENT operators and as such solicit the patronage of all who have the interests of the INDEPENDENT telephone movement at heart.

Our prices are right. Let us estimate on your requirements during 1918.

42nd ANNUAL MEETING

FREDERICTON, N. B.

MARCH 12-13-14-15, 1918

Excursion Rates on Canadian Pacific and Canadian Government Railways at First-Class Single Fare.

The 1918 meeting promises to be one of the most successful in the history of the Association.

Prominent Agricultural Authorities will address the meeting on various topics.

Seed Fair in connection will be held March 12-15, in the Drill Hall, Normal School, Fredericton, N. B.

PRESIDENT MURRAY'S ADDRESS AT THE N. S. F. A., TRURO

Gentlemen:

It is with pleasure that I, as your president, extend to you all a very hearty welcome to this, our twenty-second annual convention. Meeting this year as we do in this busy Town of Truro, and looking back upon a fairly prosperous year, we farmers of Nova Scotia feel that we have many reasons to be thankful to the Giver of All Good Things for the blessings that He has bestowed upon us.

The year 1917, although not as bountiful in its harvest as the previous year of 1916, still owing to the increased acreage under cultivation and the average returns being fair, the grand totals amounted to just about the same, and the increased price obtained for the surplus leaves the farmer generally better off than they were a year ago.

Coming together here in Truro instead of at Halifax as we intended, we are brought forcibly in mind of the fact that we are meting once more under a dark war cloud, the most destructive that the world has ever known, but the silver lining to the cloud is that we are one year nearer victory than we were when we last met and we here in Canada must all suffer in whatever way we may be called upon to do. Still through it all we have a pride in the manhood and womanhood of this Dominion for the manner in which they have convinced the world that we take second place to no country in existence, and that we citizens of this Dominion, individually and collectively, can do our bit with the best the world has produced. When men high up in the councils of the proudest nation of the world, United States, speaking in public say that no greater honor can come to them than to have their name written side by side with Canada, we get some idea of our boys at the Front.

I have heard this town where we meet this year called the Hub of Nova Scotia, I presume owing to its railway facilities. However, whether it is entitled to that name from a commercial or geographical standpoint or not we farmers are all willing to admit that it is entitled to be called the Hub of Nova Scotia from an Agricultural point of view as it from the Agricultural College here that agricultural information radiates to all parts of the province. I have been over a considerable part of Nova Scotia since our last convention and have met a number of farmers, stock men and orchardists and was often struck with the number of times I heard the remark, "I have written to the College to find out what I had better do about this or that," or "I am going to write and find out from Principal Cumming, Prof. Trueman or Mr. Fuller (as the case may be)." It appeared to me that the minute they got up against something that they did not know or wrere not quite sure about they immediately applied to the College of Agriculture for the necessary information. I do not know whether we quite appreciate to the full extent the privilege of having such an institution where we can have our difficulties settled for us.

The Halifax Exhibition of 1917 was, I think without a doubt all circumstantances considered, the best held for several years. When an agricultural exhibition in a city with the limited population of Halifax will roll up such an attendance in war times as our last show did it surely must be considered a vast success.

I spent several days there and the Fakers did not do a thing to me . I spent several hours among them and watched their many ingenuous devices to rake an easy dollar, and also watched with much interest the fun which their customers had in blowing in a few dimes in trying to beat at the other fellow's game, but I was not detective enough to find anything particularly objectionable in the whole midway.

The racing was very good and reflected very creditably on the management and superintendent of that department as every race seemed to be won by the horse that was entitled to it.

The stock was about the same as usual with the xeception of the dairy cattle which every year for the last several years, to me at least, seems to improve rapidly. That department was helped out greatly by the exhibit from the College herd. Considerable of the stock in some departments showed the lack of care consequent to a scarcity of help on the farm and in the stock barns. But taking it all through it would at least hold its own with any show I have ever attended at Halifax.

Now, gentlemen, I am not going to take up much more of your time in talking about the past but I will ask your attendance for just a minute or two on the outlook for the coming year. As near as I can judge we are up against several problems which will require all our best efforts to save satisfactorily.

It is going to be very difficult to get seeds both as to grains and small goods so it is up to us who have seed

Agricultural Societies as a Factor in Greater Production

Your Secretary wished me to address this Convention. I consider it an honor to have an oportunity to do so. This body, I take it, will in a large measure determine the trend of Agricultural effort during the coming spring. Your deliberations and decisions will have a far reaching effect in determining what we as farmers should aim for in our crop production next year. Your Association, made up as it is of representative farmers from every part of Nova Scotia, should definitely outline a policy which will serve to stimulate and guide our farmers in their agricultural endeavors.

As farmers, we realize we have an important National duty to perform. Action on the part of every individual is imperative. Equally important is it that this action be directed along well defined lines. My object at this time is to outline how material progress can be made through working up more enthusiasm in our Agricultural Societies, by bringing our people together for a definite purpose.

We have in Nova Scotia, as you all know, three Agricultural Organizations, each designed for a particular purpose. First, and what should be the leader in these organizations, is the Nova Scotia Farmers' Association. This is made up of delegates from the other Agricultural Organizations. These delegates are men selected from the other organizations, and who may be considered leaders in their respective districts, men who can report back to their vraious organizations the decisions of this body. Second, the County Farmers' Association which reflects, or should do so at least, the opinion of Agriculturists of their county. This body is made up of men from Agricultural Societies, as well as those not connected with such organizations. They meet together once a year or more and appoint delegates to attend this meeting. Third, we have the Agricultural Societies, of which there are some 263 in Nova Scotia, with a membership of some 10,500 farmers. This latter organization confine their efforts principally to the securing of sires for their herds, and subscribe amongst themselves some $20,000, to which the Government of Nova Scotia adds $15,000, or more. The Agricultural Society is supposed to have to do with everything calculated to advance agriculture in the community in which it is located. It is evident, therefore, that these organizations are dependent one upon the other, and active Agricultural Societies are necessary if County Farmers' Associations are to do what is required of them, and without active County Farmers' Asociations we cannot hope to have an aggressive Nova Scotia Farmers' Association.

The important thing, therefore, is to make the Agricultural Societies more active. Their activity, on the other hand, is influenced by the doings of the County Association, and the County Association is influenced by the Provincial Association. In short it seems that an agressive central organization is of first importance, next an active County Organization, and then as a matter of course you are sure to have active Agricultural Societies.

The question one asks themselves then is "What has this central organization done to help the other arganizations more or less dependent upon it for inspiration and guidance? What constructive policies have been outlined? What definite policy have you as deligates for this meeting? Do the delegates of this meeting represent their own views only, or are they representing the views of their various societies? Have you brought the members of your respective organizations together to discuss with them and formulate plans as to how you can turn your agricultural resources to the greatest national profit in 1918? Or are you here with no constructive plan? If you have no plan, or have not attempted to bring your community together at this crisis in our national life, ask yourself in where does your responsibility lie? Have you done your "bit," let alone your "best," in helping your community to measure up its posibilities?"

In the first place legislation should be enacted making it obligatory on the part of an Agricultural Society within a County to send at least two delegates to the County Farmers' Asociation Meetings. Means should be devised whereby expenses of delegates to this organization may be paid in part, at least, and, possibly by means of a per capita fee of say 10 cents to be exacted from each Agricultural Society and a like amount from the local Department of Agriculture. This would bind the Agricultural Societies to the County Farmers' Association, which we think is much needed at present. Under this arrangement a more effective County Organization would be posible. Through this arrangement matters of importance could be passed from the Agricultural Societies to the County Associations for general discussion there, and matters brought up at the County Associations discussed at the Meetings of the Agricultural Societies, and the delegates coming to the Central Association would fairly represent the views of the rural communities throughout. From this central organization something tangible could then result.

Such organization would throw some responsibility upon Agricultural Societies, they in turn would throw responsibilities upon the County Association, and then this organization would feel its responsibilities. Healthy development can be brought about only by placing responsibility upon our various organizations.

To illustrate the point I wish to make I will refer you to the efforts put forward in Kings County by the County Asociation. Notices were sent to both President and Secretary of each Agricultural Society requesting that they send delegates to on Agricultural Rally held under the auspices of the County Association, and at that meeting report as to what they were doing as an organization to assist in greater production. Three societies out of 13 reported. Members from other societies were present, no doubt, but they had nothing to report. I do not say that these societies did nothing, but their efforts if put before such a gathering may have stimulated greater activity in other societies. At this rally also the County Councillors were requested to attend, and their response to the call was all that could be xepected.

This meeting, or rally, was a decided success and the matters brought up there if acted upon by the members and reported back to the different Agricultural Societies would stimulate their some 600 members to greater activity.

The opinion of this gathering is set forth in the following resolution, adopted after full discussion of the various subjects:—

Reolution re Increasd Wheat Production

"Resolved that, owing to the fast "increasing demands that are being "made on our Dominion for wheat "and flour, resulting from the Euro-"pean War, we as an Association "feel it our urgent duty to stimulate "and promote the production of this "crop throughout our County so that "the maximum amount may be ex-"ported from our great wheat grow-"ing provinces of our Dominion to "help feed our and Allied Armies "and Nations in Europe, and thus "help bring the war to a speedy and "victorious conclusion."

Resolution re Increased Production of Clover and Turnips

"Resolved that, in view of the fact "of the scarcity and high cost of "our feeding stuffs, (concentrates), "resulting directly from the high "cost of production and indirectly "from the War, we as an Associa-"tion shall endeavor to urge upon "our members and neighbors "throughout our County the neces-"sity of devoting more of their ener-"gies to the production of clover and "turnips, two crops that can be eas-"ily and successfully grow on any "of our farms, and use our high "concentrates to a more limited ex-"tent, in conjunction with the above "crops to produce a finished pro-"duct."

Resolution re Live Stock

"Whereas, owing to the high cost "of feed, much live stock is put off "in a partly mature state, many "heifers fit for breeding are also "sold for beef, and calves vealed "that could be made into profitable "steers, and, whereas, we as farm-"ers should as a national service "protect our Nation's meat supply "by stopping this loss, and do every-"thing possible to increase our live "stock in order to protect our arm-"ies in the trenches by making a "shortage of meat impossible, there-"fore, resolved that this Association "advocate that some system be "adopted to limit the number of im-"mature live stock sold, particularly "to discourage the sale of good "breeding heifers for beef, and dis-"continue the sale of veal calves ex-"cept in cases where they will not "likely make good beef steers."

Resolution re Bean Growing

"Whereas, beans, owing to their "richness in protein, can in many "cases take the place of meat, and "whereas beans can be profitably "gorwn on almost every farm in "Kings County, therefore, resolved "that this Association think it ad-"visable for every farmer to do what "he can to increase the area in this "crop during the present year there-"by increasing the posible export-"able meat for army use."

Resolution re Care of Stable Manure

"Whereas four-fifths of the potash "and two-thirds of the nitrogen in "manure voided by animals is in the "liquid, and whereas these liquid "manures are often lost through "open floors, lack of proper litter for "absorbents, and outside leaching, "therefore, resolved that this Assoc-"iation do everything possible to "encourage tight stable floors, more "general use of absorbents, and bet-"ter housing of the manure in order "to prevent this loss as far as pos-"sible, thus increasing production "and rendering a National Service "thereby.'

Resolution re Agricultural Meetings

"Whereas, Agricultural Meetings "are a powerful factor in bringing "about efficiency on the farm, that "such effort on the part of the farm-"ers will increase production by in-"creased efficiency, but as such "meetings have in the past, been "poorly attended by farmers in "some sections where such meetings "were held, therefore, resolved that "this Association advise the more "general holding of Agricultural "Meetings and give assistance by "furnishing speakers, but that meet-"ings be held only when the farmers "of a district ask for them, and will "agree to assist in making the meet-"a success.

(Continued on page 188)

Developing the Farm Telephone

Prince Edward Island is Behind all Other Provinces in This Respect---New Brunswick Next

"How to make life more interesting on the farm," has been a subject for endless literary efforts, letters, newspaper articles, pamphlets and what not. All kinds of suggestions have been made, some good, many impossible. One of the greatest hoons to the farmer, however, is the rural telephone. That connection with his neighbor and the outside world has done much to ameliorate conditions that our forefathers faced and met. The rural telephone is no longer an experiment. It is a necessity. It brings to the door of teh farmer, the doctor, the neighbor, the markets and endless advantages that need not be mentioned. he telephone has revolutionized the whole rural life of communities in which it has been generally adopted.

In some of the provinces of Canada there has been intensive development of rural lines. Saskatchewan, which leads, has inaugurated a splendid system, under which her rural 'phones are installed.

The Government permits farmers to incorporate themselves into local Companies and to issue debentures in amounts sufficient to cover the construction of their systems. The construction itself and the material and apparatus used must be of the highest possible quality so that the Saskatchewan farmers' lines would be a credit to any operating telephone and telegraph Company in the world. The debentures hear interest at not to exceed 8% and principal and interest are payable in fifteen annual istalmets, so that a farmer has fifteen years in which to pay for his telephone system. That this method has proven satisfactory is best evidenced by the Government statement from which the following paragraphs are quoted:

"Taking the rural telephone companies first, we find that on May 1, 1916, these numhered 641. In the year ended May 1, 1917, a total of 111 new companies had been added and from May 1, 1917 to October 13, 1917, a further 109 companies have had their lines constructed and passed inspection, while 37 extensions to existing lines had also been completed. This makes the present number of rural telephone companies 861. On May 1, 1916, there were 18,150 subscribers to rural telephone companies; by May 1, 1917, there had heen added 5,663, and by Octoher 13, 1917, a period of only five and a half months, a further 6,089, making 426 more suhscrihers added this year as compared with the previous year. The total number of subscribers now stands at 29,902.

On May 1, 1916, there were 18,189 pole miles; in the subsequent season 6,667 pole miles were added and during the last six months 5,692, which hrings our total rural telephone pole mileage to 30,548."

The Sackatchewan farmer has found that a telephone saves so much expense in the course of each year that, notwithstanding the very high cost due to present day conditions, he cannot afford to he without it.

All of the Saskatchewan lines are built by contract and labour in the Prairie Provinces is not only very scarce hut very high. All the poles have to be shipped from Wisconsin and Minnesota. he telephones in that Province run ahout one per mile of poles, and the cost per telephone due to the conditions outlined is ahout $200.00. If it pays the Western farmer to spend $200.00 to build his mile of line and instal his telephone, why would it not pay a New Brunswick farmer to incur half that expense or even as great an expense if the Government demanded the same type of construction ?

It seems to me the Saskatchewan idea is the fairest means of promoting this kind of development, and it certainly gets the farmer his telephone. The only reason twice as many telephones were not installed this year in that Province is because the labour and material with which to instal them wre not available.

In Alherta, where the Government will not permit farmers to build their own lines and is unahle to build them itself, because of the high cost of construction and the low rental at which it furnishes rural telephone service, I have been told there are anywhere from 20,000 to 30,000 applications for rural telephones on file. So you see the peculiar situation of one Government stihing development of this sort while its immediate neighhour does everything to encourage it.

If there were ever a time when the telephone on the farm is a real necessity it is right now, when lahour is scarce, prices for farm produce are high and increased production is necessary from a selfish as well as from a patriotic point of view. Any farmer or farmer's wife who has a telephone would say that it is the most necessary implement on the farm.

In the States of Georgia and South Carolina, town after town raised sums of money with which to assist farmers in their vicinity to huild rural lines into their towns. They did not do this to help the farmer as much as to help themselves, because they realized that every rural line radiating from their towns meant bringing that much more business into their town which might otherwise be diverted to a neighhouring town. If the two towns were twenty miles apart and a rural line from one went within five miles of the other town, the town with the telephone line was getting the business from fifteen miles of the adjacent territory instead of the ten they might normally expect to get. In that same part of the country hundreds of country physicians mortgaged everything they had to raise enough money with which to build one or two or more rural telephone lines into the country surrounding their offices, knowing that every subscriher on one of these lines and every neighbour of that subscriber would call on them for help when medical service was required.

In Nova Scotia, too, the government is awakening to the great value of the rural telephone. There a government superintendent oversees all work done under the act which permits the province to grant a honus of $20.00 per mile to rural companies. The work is carried out according to specifications laid down by the government and much has already been done to stimulate the construction of farmers' lines.

In Prince Edward Island and New Brunswick, however, the progress along these modern lines has been practically nil. New Brunswick stands second last on the list of the provinces, in regard to the construction of rural lines. So much depends on the telephone, that to argue in favor of its advantages would be to waste time. With so many evidences at hand of its great service in country districts, it would appear that a well thought out plan of telephone construction in rural New Brunswick would be in order. There is now no question as to successful management. That rural lines may be built well and at the same time made to provide revenue for operation and maintenance is established beyond doubt. Arrangements could be made with trunk line companies to give connection to the smaller systems and thus the whole province could be put in touch with the outside world.

hTe inauguration of a well defined policy of governmental assistance would need no elaborate advocacy or defence. The principal danger to be guarded against is that of insufficient revenue to ensure modern equipment and charges sufficient to meet operating expenses and keep the lines in good repair. Many rural lines have proved failures, simply because those directing them failed to appreciate that a poor telephone system is to be avoided at any cost, and that it costs money to guard against depreciation. Rediculously small tolls were charged on too many of these llnes, with the inevitable result that disaster, sooner or later, overtook the enterprises. Then, too, there has been a duplication of lines, which should be avoided. Too, many communities have been forced to support two hadly served lines, when one properly conducted telephone system would better serve the public need.

The New Brunswick government might well take into consideration the bonusing of rural lines, built, like those of Nova Scotia and other provinces, under competent supervision. Nothing will do more for the farmer than a well estahlished esystem of rural telephony. Excellence, however, should be the guiding principle of the undertaking. The old slipshod methods of hanging a wire to the hranch of a tree, or the peak of a harn, should be avoided. Only standard equipment should be tolerated. And last but not least the service charges should be sufficient to guarantee the successful operation of the system. With these safeguards, the provincial authorities would have little to fear from failure of any well digested scheme which might he worked out and to the appreciable benefit of many communities.

Wheat Growing in Nova Scotia

The following information recently published in Bulletin form by the Nova Scotia Department of Agriculture will be of interest to the farmers of the other Maritime Provinces, where a campaign for increased wheat production is heing conducted.

"There is no occasion, in beginning this press bulletin, to deal at length with the facts that wheat is the world's most important food product, that there is a world shortage of wheat and that plans are being perfected to conserve every possihle hushel of wheat for the use of our soldiers in Europe. Partially due to these considerations and partly to the record prices prevailing for flour, which in turn were the result of these self same considerations, there arose in the Spring of 1917 an unusually large demand for seed wheat in Nova Scotia. The principles that led to the 1917 rush into wheat sowing will assert themselves again in 1918 and it is likely that they will he enforced by more rigorous enactments for the conservation of wheat which will lead many a Nova Scotia farmer who may not, at the present time, he thinking seriously of the suhject to ultimately make plans for a substantial increased acreage of wheat.

Shortage of Seed in 1917.

Last year, the Provincial Department of Agriculture, tried to anticipate this condition and circulated statements in the month of February throughout the Province in regard to the seed situation. None the less, it seemed impossihle to arouse the interest of many until seeding was actually on when, despite the fact, that the Department supplemented the regular seed trade by handling several thousands of bushels of seed, a shortage occurred and at the last as high as $4.00 a hushel was paid for very ordinary seed. There is no need of this condition being duplicated in 1918, if those planning to grow wheat will make their plans immediately and get their orders placed with their seedsmen at once.

A Preparedness Bulletin

This press bulletin is being issued at this early date in December to help avoid the unpreparedness of 1917. It especially directs the attention of the seasoned grower as well as the amateur, to the importance of **securing their seed wheat supply at once.** But it also includes some warning in regard to the limitations of wheat growing in the Province which the inexperienced will do well to consider hefore going too heavily into the venture; for it would be bad husiness for the individual and for the country as a whole if extensive areas which would produce more food units in the shape of oats and other crops, were sown to wheat under conditions which would yield only a small return of that crop. The advice "Grow Wheat" is all right but it is better advice "To Grow Wheat on Land Suited to Wheat and Oats and Other Crops on the balance of the Plowed Land."

Increased Area of Wheat Crop in Nova Scotia

Prior to 1914, about 14,000 acres of wheat annually were grown in Nova Scotia with an average yield of about 20 bushels per acre. Recent estimates indicate an increased average of from 4,000 to 6,000 acres. The largest relative increase has been around the Bras d'Or Lakes in Cape Breton, where the Government Cereal Mill erected in 1915 has proven the means of increasing the acreage some ten to fifteen times. There has also been a signal increase in the Annapolis Valley following the erection of a roller process mill at Berwick in 1915. Unfortunately, wheat as well as other cereals did not produce large crops in this part of Nova Scotia in 1917 so that the Valley farmers may, unwisely we think, be discouraged in their efforts to grow wheat.

The Premier Wheat Growing Counties

The leading wheat growing counties of Nova Scotia are those counties in the northern half or the Province bordering on the gulf of St. Lawrence, viz., Antigonish, Pictou, North Colchester and Cumberland Counties. These counties are fairly well served

with wheat mills. In fact, the mills already established could handle more wheat than is at present brought to them. There should be included with these counties, the County of Inverness, in Cape Breton, where the conditions are very similar, but Inverness has lagged behind, due in part at least to lack of milling facilities. However, the new roller process wheat mill, which is almost completed at Inverness, should make up for this deficiency and, with the mills at present in existence, take care of a largely increased wheat acreage. Substantial progress has also been made in the vicinity of Meteghan, Digby County, where a modern roller process mill was erected some years ago. Parts of Hants County and the Musquodoboit Valley in Halifax County have also produced very considerable quantities of this important crop.

New Roller Process Mills

As an indication of a more extended interest in wheat growing in Nova Scotia, it may be mentioned that in addition to the mills referred to in the foregoing, which have been erected since 1915, the following additional roller process wheat mills are either in course of construction or have been recently completed; one at Boylston, Guysboro County, one at Gore, in Hants County, and one at Bridgewater, Lunenburg County. Six of these mills erected since 1914, have been assisted by the Provincial Department of Agriculture policy for encouraging wheat growing, and these together with some nine roller process mills in existence before 1915 and a substantial number of the good old fashioned French Burr mills ensure milling capacity for a much increased acreage.

Note:—This provincial Government aid has been confined entirely to mills erected in localities where roller process milling facilities were not heretofore accessible. No aid has been given in those central counties, where the magnitude of the industry warranted private unaided enterprise.

Wheat a Delicate Feeder

Since it is the intention of the writers of this bulletin to present the importance as well as the means of increasing wheat growing it seems the part of wisdom to begin by discussing the limitations of the crop. Wheat is more sensitive to its surroundings and requires the fertility of the soil to be in a more available condition than does oats. If, for example, a sod it turned under or barnyard manure is applied, it must reach a more thorough state of decomposition to produce a good growth of wheat than is the case with oats or in fact almost any other standard farm crop. Moreover, the wheat plant takes up about 85% of its food supply from the soil by the time it is half grown for which reason it requires soluble plant food in the early part of the season. This soluble plant food will be limited unless the soil is naturally rich or has been well fertilized. Oats on the other hand will often do well on sod land where the sod is only partly rotted. Moreover, oats do not require so much of the plant food from the soil early in the season and so a creditable crop may often be produced on land which would yield a very indifferent crop of wheat. The oat is a hardy feeder. Wheat is a delicate feeder. Hence it is a great mistake to grow wheat on any but well drained land which has been put into a fairly high state of tilth and fertility. If you have not this kind of land, stick to oats for your cereal crop.

Hoed Crop Land the Best

For the foregoing reasons, one should usually aim to grow wheat in Nova Scotia on land which, during the previous year, was under potatoes or roots or some other hoed crop. If, for some reason, there is not enough of this hoed crop land, try to grow the wheat on land which was plowed the previous fall and on which the sod has had some chance to decompose.

We have seen a few good crops of wheat on spring plowed sod land, especially along the Gulf shore section, but such land has always been in a good state of fertility, and has usually been a fairly light, well drained soil in which the sod has rotted rapidly. If it seems necessary to grow wheat on land plowed out of sod in the spring be sure to harrow very thoroughly and apply rather more manure or fertilizer than would ordinarily be used. Unless this is done results are likely to be disappointing. It is not good practice to grow two cereal crops in succession on the same bit of land, but if a piece of land, which during the previous year was in oats or barley, is the only piece available for this year's wheat, it may be used, provided it receives a considerably higher application of fertilizer or manure than would ordinarily be given.

Cultivation

If possible, the land selected should be fall plowed and left in a rough pulverized condition. As early as possible in the spring with the use of a disc harrow or a spring tooth harrow followed by a spiked tooth harrow, the land should be put in good mellow condition. If the land was not plowed the previous fall, spring plowing will be necessary, but since it will generally be light plowing, two furrow gang plows may, when available, be used. Too much importance cannot be laid upon giving the land sufficient harrowing. The seed bed cannot be in too fine a condition. It is important that the land be rolled, for wheat more than any other cereal crop requires a firm seed bed. Some do this immediately after seeding but it can be effectively done after the plants are up to 4 inches or so high.

Manuring and Fertilizing

Provided the previous crop of potatoes or roots was a bountiful one, there is no need for further application of manure or fertilider. But, if the previous crop was a moderate or poor one, it is important to add a small dressing of manure or fertilizer. Such a dressing should always be made when the previous crop was either a cereal crop or hay. A fair application would be from ten to fifteen loads of fine manure or 500 to 1000 lbs. of fertilizer per acre. This fertilizer may be either a "grain fertilizer" or may be a mixture of from 100 to 150 lbs. of Nitrate of Soda and 400 to 800 lbs. of either basic slag or acid phosphate. If the soil is fairly rich the Nitrate of Soda may be omitted. Five hundred to eight hundred pounds per acre of dogfish fertilizer or bone meal will give good results. A frequent practice, experimented with successfully by W. S. Blair, of the Experiment Station, at Kentville, is to apply about 100 lbs. of Nitrate of Soda acre after the crop is up. An equal amount of sulphate of Ammonia per would also give satisfactory results. Be sure to make such application on a dry day, else the leaves may be burned. Fresh manure applied in the spring is often the source of troublesome weeds. If it must be used, apply very early, so that the weed seeds may sprout and be destroyed before seeding.

Sow Early

The very earliest sowing possible is best for spring wheat. This gives a long period of slow growth while the weather is cool and so provides a strong root development. Moreover, from the standpoint of milling, early harvesting is important so that ample time can be allowed for the grain to thoroughly dry in the fields and early harvesting can only be ensured if the crop is sown early. Because this crop must be seeded early, only well drained soils are suitable, for the seed bed must be dry and warm at time of seeding. From 6 to 10 pecks per acre is the common amount of seed to sow. The best results on the average have been gotten from about two bushels per acre. Before sowing, the seed, no matter what its origin, should be treated for smut, bu the use of a formalin solution which is described subsequently in this bulletin.

Order Farm Machine Repairs Now Delay May Mean Loss

HAVE YOU thought of the difficulty you are going to have this year in getting repairs for your machines? It is the most important thing for you to be thinking about right now. Your crops may depend upon it.

You, no doubt, realize that all manufacturers are hard put to it to get materials; and the transportation facilities, freight and express, are congested to such an extent that shipments go through very slowly.

The implement manufacturer and agent in Canada realizes this today and the utmost is being done to take care of the farmers' requirements for repairs. Unless the farmers are also foresighted, many of them are likely to realize the difficulty too when the season for field work opens. They are going to be greatly handicapped if they wait until just before they are ready to use the machines before overhauling them and finding out what parts will have to be replaced.

We cannot urge you too strongly to get busy on this at once. Overhaul every machine on your place and see just what parts you need to put them in good working order, then place your order at once. This is the only way you can be sure of having the new parts in time for use.

We are making every possible effort to get ample stocks of repair parts to convenient points where you can get quick service. International Harvester branch houses are located in all parts of Canada and they always carry large stocks of repairs. Besides there are thousands of local agents who carry a good supply of the parts usually called for. Under normal conditions, you could expect quick action on repair orders sent to us or to any of our agents, but at this time conditions are not normal and it is a personal and patriotic duty to look ahead and plan ahead and be prepared to avoid confusion and crop-wasting delays.

Remember the first orders received are the first to be served, so you can recognize the importance of overhauling your machines now and seeing what you will need and getting your order placed. Better be ready than sorry. Do it now.

International Harvester Company of Canada, Limited

BRANCH HOUSES

EAST—Hamilton, Ont., London, Ont., Montreal, Que., Ottawa, Ont., Quebec, Que., St. John, N. B.

A Good Seeding Down Crop

There is no better crop to seed down with than wheat. We strongly recommend a mixture made up somewhat as follows per acre: Timothy—6 to 10 lbs; Red Clover—7 bs.; Alsike Clover—2 lbs. Should Alsike clover seed be considerable cheaper than Red Clover, we would recommend a little more Alsike and a corresponding lesser quantity of red clover.

Seed

If you have grown good wheat on your own farm, you cannot do better than put some of thiis through the fanning mill for your use next spring. Home grown acclimated seed, if the kernels are good and plump, is generally the best. If you have no such wheat of your own, inquire of your nearest neighbors who haev been successful wheat growers and buy from them. If neither of these sources are available, you will have to go to your seed merchant, but be sure that he gives you a good article even if he is compelled to ask a fairly stiff price for it. If you do not know where to get the kind of wheat you want, write to the College at Truro, or to S. J. Moore, Dominion Seed Inspector, Truro, and they will direct you to your nearest source of seed supply. But whatever you do, plan for your seed supply now.

Western Seed

There will not be a very large supply of good seed wheat available in any of the Maritime Provinces this year. Fortunately, however, the quality of the Western crop is superior. The Seed Branch of the Federal Department of Agriculture, through their Seed Grain Purchasing Commission are saving at the Government Elevators considerable supplies of Western grown wheat suitable for seed.

Seedsmen and co-operative farmers Associations, who are in a position to handle carload lots, are recommended to get in touch with G. H. Clarke, Seed Commissioner, Department of Agriculture, Ottawa, or M. Cumming, Secretary for Agriculture, Truro, N. S., who will advise the necessary means to get carload lots of seed from this source.

Provincial Policy

It is the policy of the Nova Scotia Provincial Development of Agricultural Resources Committee to assist seed firms and co-operative farmer's organizations to purchase seed wheat in carload lots so that they will get the advantage of lower prices, and sell to farmers at proportionately lower prices. Any firm or organization who are in a position to dispose of approximately a carload or more of seed wheat should communicate at once with M. Cumming, Secretary for Agriculture, who will advise them of the provisions of the policy.

Variety

Practically no winter wheat is grown in Nova Scotia. The winters are too open to afford protection for the plants. Spring wheat is the stand by. he following are the best known varieties grown in the Province: White Russian, Red FiFfe, White Fife and Marquis.

White Russian has generally proven the hardiest of these varieties and the largest yielder. Unfortunately, the grain is somewhat starchy and soft and will not give as large a percentage of flour or as good a quality as the other varieties. Nonetheless, the quality can be made almost equal to the best if the wheat is thoroughly dried in the stooks before it is hauled to the barn. The details of this practice are set forth on one of the last pages of this bulletin. Some millers would like to see this variety eliminated from the Province but because of their successful experience with it, many farmers are determined to stick to it.

Red Fife is the best known of the harder strains of wheat. In general,

RAISING MORE PRODUCE

It's over three years, now, since the Maritime Farmer called attention to the need of increased farm production. During that tiime many campaigns have been instituted to bring this about and to effect savings, after the harvests be gathered. The Maritime Farmer figured in 1914, that with millions of men taken from the farms of the world, distress and want must follow. That both are impending is admitted. There will be a world shortage of foodstuffs this year, and 1919 promises much worse conditions. With that outlook, it should not require much to convince everybody that Canada should provide her largest possible crop next summer, and we in the Maritime Provinces should see to it that we will be among the leaders in Canada as food producers. One of the principal crops needed is wheat. Of course, the Maritime Provinces have their limitations as wheat growers, but we can do much to add to the total output and hundreds of farmers will be able to produce sufficient wheat to make them independant of the west, so far as flour is concerned. Then there is the by-products to be considered and these will have a very special value this coming fall, in view of the already marked scarcity of mill feeds. Of course there is the labor problem to face, but we should remember that those of us at home are favored as compared with the boys, who are valiantly fighting for Canada in the cold, mud coated trenches of France. To feed them and to feed ourselves, every possible sacrifice should be made. And apart from the duty we will perform by so doing, every farmer has the assurance that he stands to profit financially as well. Let us repeat the appeal to all loyal farmers, "Make the coming year a banner production twelve-month on your farm."

* * *

CLEANING UP MILITARY HALIFAX

Months ago the Maritime Farmer appealed for a cleaning up of the military farce at Halifax. The conditions there were little short of a disgrace to Canada. For over three years many business men of that city wore the king's uniform, drawing pay, varying from lieutenants to colonels. At the same time these men, in too many instances, attended to their every day affairs, so that the country was being bled white to maintain conditions unwarranted by the serious financial obligations which the war was imposing upon Canada. The Maritime Farmer not only protested through its columns against this waste of public funds but it took the matter up with Ottawa and insisted that something be done to end it. Our stand was that if there were any sinecures in the gift of the government, the snaps should go to returned men who had been wounded in France, but who had recovered sufficiently to enable them to sign a check, or discharge some other equally irksome or onerous duty. Now the change has been decided upon. The "graft" days of the Halifax garrison are over. Those officers, who have been fighting bloodless battles in the "Garrison City" are to be given short shift, some of them have been dismissed. Others will follow and the jobs will be filled by real fighting men. Another change that will be welcomed is the retirement to civil life of a number of clergymen, who draw pay as chaplains to the garrison forces, retaining at the same time their positions with their several churches. One chaplain will look after the spiritual welfare of the men, with whatever outside assistance he requires. Too much credit cannot be given to Hon. Frank B. Carvell, minister of public works, for this important reform. Mr. Carvell undertook to bring about the change and with characteristic directness, he performed what may be termed a highly successful operation. Canada needs men in civil life and the "heroes" of Halifax will doubtless welcome the opportunity to perform a real service for Canada by devoting all of their time to their businesses, instead of only part of it, as they did when they were being doubly paid by the militia department. Mr. Carvell sold a nice lot of victory bonds when he started in to reduce the pay list at Halifax.

FARMERS SHOULD ORGANIZE

Events transpiring throughout the world indicate that a violent wrench will be given old time ideals, when this cruel war is over. No more will well recognized ideals of pre-war times prevail. There is to be a general shaking up in the affairs of this mundane sphere. The revolution in Russia is leading to conditions that no man can forsee. Anarchy, more advanced than its staunchest supporters dreamed of, is rampant in that blood-soaked and unfortunate kingdom. As for Germany, the hope of the world lies in the democracy of that military ridden country. Even staid old England will awaken, as she never dreamed of doing, when the last gun is fired. There the workers are uniting to protect rights already won and to demand new reforms. In Canada, too, labor organizations are developing new strength and will assert what they deem to be their just demands. No reform of that character can be effected without affecting the farm interests of Canada. There are many things in common between the damands of organized labor and the farm but there are other things which labor organizations are calling for which will adversely affect farmers. And these adverse problems will have to be fairly met when war is concluded. How can they be met, unless farmers take a hand in the "organization" game? In the Maritime Provinces something has been accomplished along these lines, but there is no organization, founded on agriculture as a profession, which, forsaking all else, cleaves to agriculture and its interests. Labor is ever represented in the legislative halls of Canada. Other interests have their parliamentary representatives, but agriculture has yet to awaken to the need viseing all legislation calculated to affect the interests of the farm industry. Every necessary step should be taken to combat legislation inimical to the welfare of farm interests. This can only be done through a strong well organized agricultural organization. No such exists in the Maritime Provinces today. There are farm organizations but they are all devoted to one or other of the special sides of farming and no well defined movement to resist encrouchment on the recognized rights of the farm has been inaugurated. Is it not time that something more definite along these lines was inaugurated? Has not the time arrived for farmers to assert themselves along proper lines. We do not mean that petty opposition should be directed against all and sundry legislation, but the farmer should make his voice heard in the land, AS A FARMER AND NOT AS A POLITICAL HACK FOR THIS OR THAT PARTY. The conclusion of the war will render this doubly desirable. The coming meeting of the New Brunswick Farmers and Dairymens Association would be a good time to start something along new and progressive lines.

A PLAN FOR MONTHLY MEETINGS

The men who have to do with the garnering and conserving of the Empire's food resources must plan for the future, if our soldiers and our Allies are to have a sufficient supply of food to enable them to carry the war to a successful termination. These men must look beyond the present. They must look into the future and plan now now for the source of supply from which they must draw supplies this year, next year and the following years. The unexpected may happen at any moment and consequently a little more than the ordinary needs must be attended to, so that the losses of goods in transit and otherwise may be surmounted. These men pass their findings and recommendations on to the British Government, who in turn communicate their wishes to the various food producing colonies. The Dominion Government is communicated with re the part that Canada is expected to perform. Immediately on receipt of such communications the Federal Government gets in touch with the heads of the governments of the respective provinces. Matters connected with agriculture are brought to the attention of the Department of Agriculture, and the Department gets in touch with the rank and file of the farmers through the press and by communications with Agricultural Societies.

The farmers are nobly responding to the various calls mads on them.

Many agricultural societies in the Maritime Provinces hold stated monthly meetings for the discussion of agricultural problems and for social intercourse. Some societies that were not heretofore accustomed to meet in this way, are beginning to realize the important place the Agricultural Society plays in getting the farmers together to do their utmost to win the war and are now planning to hold monthly meetings so that all communications re the empire's needs that may be directed to them may be acted upon promptly.

We would recommend all societies that have not yet put this plan in action, to do so at once, as a war time measure. We believe the farmers will be so well pleased with this system that they will continue to meet every month after the war is over. Try it!

* * *

"Our utmost" not "our bit" is what the empire demands in all lines of industry, if every line of action is to be conducted efficiently.

LIST OF PRIZE WINNERS AT THE NOVA SCOTIA PROVINCIAL SEED FAIR—TRURO, N. S., JAN. 18, 1918.

Special—Open only to members of the Canadian Seed Growers Association

Oats—Registered seed, any variety.

1—Ronald Chisholm, Antigonish, Banner, $5.00.
2—R. D. McKay, Balmoral Mills, Col., Banner, $4.00.
3—W. L. McFarlane, Fox Harbor, Cumb., Banner, $3.00.
4—John W. Murray, Balmoral Mills, Col., Banner, $2.00.
5—J. L. Cunningham, Bayhead, Col., Banner, $1.00.

Wheat—Registered seed, any variety.

1—W. L. McFarlane, Fox Harbor, Cumb., Red Fife, $5.00.
2—J. L. Cunningham, Bayhead, Col., White Russian, $4.00.
3—James J. Dunn, Lr. South River, Ant., White Russian, $3.00.
4—John W. Murray, Balmoral Mills, Col., Red Fife, $2.00.
5—R. D. McKay, Balmoral Mills, Col., Red Fife, $1.00.

Exhibits from Frize Winning Fields in Nova Scotia Fields Crops Competition.

Sec. 1—Wheat, any variety.

1—W. L. McFarlane, Fox Harbor, Cumb., Red Fife, $5.00.
2—James J. Dunn, Lr. South River, Ant., White Russian, $4.50.
3—R. M. Jackson, Jacksonville, C. B., White Russian, $4.00.
4—T. J. Grant, Antigonish, White Russian, $3.50.
5—R. D. McKay, Balmoral Mills, Col., Red Fife, $3.00.
6—J. Milligan & Sons, Kings Head, Pic., Marquis, $2.50.
7—Ronald Chisholm, Antigonish, White Russian, $2.00.

Sec. 2—Oats, Any Variety.

1—Alex. C. Chisholm, North Grant, Ant., Banner, $5.00.
2—Ronald Chisholm, Antigonish, Banner, $4.50.
3—R. D. McKay, Balmoral Mills, Col. Co., Banner, $4.00.
4—John R. Harrison, Maccan, Cumb., Banner, $3.50.
5—W. L. McFarlane, Fox Harbor, Cumb., Banner, $3.00.
6—James R. Hogan, Denmark, Col., Banner, $2.50.
7—James J. Dunn, Lr. South River, Antigonish, Banner, $2.00.

Sec. 3—Potatoes, any variety.

1—John R Harrison, Maccam, Cumb., Carmen, $4.00.
2—Alex. C. Chisholm, North Grant, Ant., Carmen, $3.50.
3—J. Milligan & Sons, King's Head, Pic., Irish Cobbler, $3.00.

Section 1—Wheat—White Fife

2—J. E. Harrison, Maccan, Cumb., $3.00.

Section 2—Wheat—Red Fife

1—C. C. McFarlane, Fox Harbor, Cumb., $4.00.
2—Allan MacDonald, St. Andrews, Ant., $3.00.
3—John W. Murray, Balmoral Mills, Col., $2.00.
4—R. D. MacKay, Balmoral Mills, Col., $1.00.

Section 3—Wheat—White Russian

1—Jas. J. Dunn, Lr. South River, Ant., $4.00.
2—R. J. Jackson, Jacksonville, C. B., $3.00.
3—J. R. Harrison, Maccan, Cumb., $2.00.
4—J. E. Harrison, Maccan, Cumb., $1.00.

Section 4—Wheat—Any Other Variety

1—Jas. J. Dunn, Lr. South River, Ant., $4.00, Marquis.
2—J. E. Harrison, Maccan, Cumb., $3.00.

Section 5—Oats—Banner

1—Alex. C. Chisholm, North Grant, Ant., $5.00.
2—R. D. MacKay, Balmoral Mills, Col., $4.00.
3—Ronald Chisholm, Antigonish, $3.00.
4—J. E. Harrison, Maccan, Cumb., $2.00.
5—J. R. Harrison, Maccan, Cumb., $1.00.

Section 6—Oats—Sensation

1—J. R. Harrison, Maccan, Cumb., $3.00.
2—George Retson, Brookside, Col., $2.00.

Section 7—Oats—Storm King—No Entries.

Section 8—Oats—Any Other Variety Named

1—John C. Chisholm, Lr. South River, Ant., $5.00, Sandy.
2—Lloyd Clifford, Brookside, Col., $4.00, Conqueror.
3—M. Campbell, Centreville East, Inv., $3.00, Wide Awake.
4—J. E. Harrison, Maccan, Cumb., $2.00, Ligowo.
5—George Sillery, Murray's Siding, Col., $1.00, Early Blossom.

Section 9—Oats, Black—Any Named Variety

1—J. E. Harrison, Maccan, Cumb., $3.00.
2—J. R. Harrison, Maccan, Cumb., $2.00.

Section 10—Barley—Two Rowed

1—J. R. Harrison, Maccan, Cumb., $3.00.
2—J. E. Harrison, Maccan, Cumb., $2.00

Section 11—Barley—Six Rowed

1—W. L. McFarlane, Fox Harbour, Cumb, $3.00.
2—C. C. McFarlane, Fox Harbor, Cumb., $2.00.
3—John C. Chisholm, Lr. South River, Ant., $1.00.
4—J. E. Harrison, Maccan, Cumb., .50.

Section 12—Buckwheat—Rough

1—J. E. Harrison, Maccan, Cumb., $3.00.
2—J. R. Harrison, Maccan, Cumb., $2.00.

Section 13—Buckwheat—Any Other Variety

1—J. R. Harrison, Maccan, Cumb., $3.00.
2—J. E. Harrison, Maccan, Cumb., $2.00.

Section 14—Field Peas—Marrow Fat

1—J. E. Harrison, Maccan, Cumb., $2.00.
2—J. R. Harrison, Maccan, Cumb., $1.50

Section 15—Field Peas—Any Other Variety

1—Allan Bezanson, Hampton, Anna., $2.00.
2—Wm. Olie, Selmah, Hants, $1.50.
3—Wm. Olie, Selmah, Hants, $1.00.
4—John C. Chisholm, Lr. South River, Ant., .50.

Section 16—Field Beans—White

1—G. H. Landry, Lr. South River, Ant., $2.00.
2—J. R. Harrison, Maccan, Cumb., $1.50
3—J. E. Harrison, Maccan, Cumb., $1.00.
4—T. J. Grant, Box 335, Antigonish, .50.

Section 17—Field Beans—Yellow Eye

1—J. R. Harrison, Maccan, Cumb., $2.00.
2—A. W. Stevens, Wallace Grant, Cumb., $1.50.
3—G. H. Landry, Lr. South River, Ant., $1.00.
4—J. E. Harrison, Maccan, Cumb., .50.

Section 18—Field Beans—Any Other Colored Variety.

1—G. H. Landry, Lr. South River, Ant., $2.00.
2—H. Bowers, Great Village, Col., $1.50
3—Jas. J. Dunn, Lr. South River, Ant., $1.00.
4—Leander Vance, Masstown, Col., .50.

Section 19—Corn—Canada Yellow

1—Manning Chute, Berwick, Kings, $2.00.
2—T. E. Smith, Central Clarance, Anna., $1.50.
3—Allan Bezanson, Hampton, Anna., $1.00.
4—G. H. Landry, Lr. South River, Ant., .50.

Section 20—Corn—Any Other Variety—Flint

1—Alan Bezanson, Hampton, Anna., $2.00, Indian Yellow.
2—T. E. Smith, Cen. Clarance, Anna., $1.50, Sheffield Prize.

Section 21—Turnip Seed

1—R. V. Ditmar, Deep Brook, Dig., $4.00, Bronze Top.
2—Jas. R. Hogan, Denmark, Col., $3.00, Purple Top.
3—Albert C. Vienotte, West Northfield, Lun., $2.00, Purple Top.

Section 22—Mangel Seed

1—Albert C. Vienotte, West Northfield, Lun., $4.00, Long Red.
2—T. E. Smith, Cen. Clarence, Anna., $3.00, Long Yellow.
3—Allan Bezanson, Hampton, Anna., $2.00.

Section 23—Timothy Seed

1—J. R. Harrison, Maccan, Cumb., $5.00.
2—J. W. Murray, Balmoral Mills, Col., $4.00.
3—J. E. Harrison, Maccan, Cumb., $3.00.
4—C. C. McFarlane, Fox Harbor, $2.00.

Section 24—Clover Seed

1—Allan Bezanson, Hampton, Anna., $4.00, Common Red.
2—Jas. J. Dunn, Lr. South River, Ant., $3.00, Alfalfa.

Section 25—Potatoes—Beauty of Hebron

1—John Retson, Truro, Col., $3.00.
2—J. E. Harrison, Maccan, Cumb., $2.00.
3—Geo. Retson, Brookside, Col., $1.00.
4—Howard King, Onslow, Col., .50.

Section 26—Potatoes—Early Rose

1—J. E. Harrison, Maccan, Cumb., $3.00.
2—John Retson, Truro, Col., $2.00.
3—R. A. Harvey, Hilden, Col., $1.00.
4—Geo. Retson, Brookside, Col., .50.

Section 27—Potatoes—Any Other Early Variety—Named

1—J. R. Harrison, Maccan, Cumb., $3.00, Burpee's Early.

SEED DISTRIBUTION

Farmers Requiring Seed Should Place Their Orders With Their County Councillor Immediately

During the past three weeks every County Council with the exception of Kings Co. which meets January 22nd, has been approached and assistance in the Greater Production Campaign requested. Invariably plans have been formulated and in several cases the Councils have arranged for collecting the orders, distributing the seed and financing the transaction in conjunction with the Provincial Department of Agriculture. The result will be that a very thorough campaign for wheat acreage will be carried on and as information comes in the necessity for a great effort on the part of everyone becomes more apparent.

Those undertaking the work of the canvass will appreciate any assistance that can be given by individual farmers. Everyone requiring seed wheat, oats or barley should send in their order to their County Councillor immediately thus eliminating the necessity of a canvass.

The responsibility in this campaign brought about by war conditions must be borne individually or the required results cannot be obtained.

The Department of Agriculture will purchase the seed through the Seed Purchasing Commission of Canada Wheat will cost $2.50 per bushel F. O B. Quebec; the freight is as follows: to Campbellton 9c per bus.; to Newcastle and Chatham 9 3-5c per bus.; to Moncton 10½c per bus..; to Fredericton and Centreville 10½c per bus. The cost of bags and handling charges at this end will be extra. Oat prices will be given out immediately they are available.

The orders for New Brunswick must be placed by the Department with the Seed Purchasing Commission at an early date.

Assist the Councillors by sending your order to them immediately.

TO DRIVE AWAY MICE AND RATS

Chloride of lime sprinkled where ratts or mice are frequent will drive them away.

When using it keep the lime in a large bottle well corked, for it must be strong. Mice heartily dislike peppermint and will not go in drawers or boxes where it is kept.

TOP DRESS all Crops with **Nitrate of Soda,** no matter what other fertilizers you may have used—100 pounds per acre for seeded crops and 200 pounds per acre for the cultivated ones. The increase will yield large profits over cost.

Write on post card for our money making books

WILLIAM S. MYERS, Director

WHEAT GROWING IN NOVA SCOTIA

(Continued from page 167)

it has not the reputation of giving quite as large a crop as White Russian but, on the other hand, millers claim more flour per bushel and better flour at that. A fairly well recognized strain called the "MacKay Strain" has been developed in North Pictou and Colchester Counties, which is somewhat hardier and earlier maturing than the western Red FiFfe. This strain has been quite well distributed of recent years and from our observation is to be highly recommended wherever it can be secured.

White Fife possesses in the main the same characteristics as the Red Fife. It is a popular wheat in parts of New Brunswick but is not now largely grown in Nova Scotia as the other varieties have superceded it. However, White Fife still has some strong friends in the Province, but our observations lead us to pronounce it as generally less satisfactory than either Red Fife or White Russian.

Marquis which is now recognized as the leading wheat of the Prairie Provinces, has been tried to a considerable extent in Nova Scotia. Some report very favorable results but on the College Farm, Truro, and at some other places, this wheat has not done as well as the aforementioned varieties. So far as milling qualities are concerned, it ranks with the best.

The major part of the seed wheat supply available under the arrangements made by the Seed Branch at Ottawa is Marquis. From our present information, we would much prefer this to poorly selected Red Fife or any other sort and consider that if other varieties are not easily obtainable, farmers will make no mistake in getting Marquis from this source. Before this Bulletin is published we hope to have completed arrangements for a supply of Red Fife. There is little White Russian available outside of local supplies in the province.

Harvesting Wheat for Milling Purposes

Whether the grower selects White Russian, which is always a fairly soft wheat, or the Fifes or Marquis, which are harder wheats, he will often harvest under the prevailing climatic conditions, softer wheat than would be harvested in the Western Provinces of Canada. However, in many years a hard wheat may be harvested and in any year the quality of the wheat may be materially improved by proper harvesting methods. In this connection we submit herewith the experience on one of the older millers of the Province, who, after twenty-five years of work, says that "with proper care there is no trouble in getting even White Russian wheat in good condition." He writes as follows:

"White Russian wheat in particular and in fact all wheats should be left until the grain is good and ripe, and then cut and left in stooks from ten to fifteen days or longer if possible. Most people are afraid of a shower of rain on their wheat when it is in stook. A good shower seems to make it in better condition for milling when it is properly dried out before putting in the mow."

"In noting the different conditions of wheat which we have handled in the last few years, we have learned that most of the soft wheat is caused by cutting the wheat straw too close to the ground, gathering up a whole lot of green clover and putting it into the mow perhaps the next day after it is cut in case it might get a shower of rain. The green clover, of course, starts to sweat in the mow and the dampness is taken up by the wheat."

"It should be mentioned," continue this miller, "that certain varieties, such as the Fifes and the Marquis, will not stand being left in the field until they are dead ripe as will the White Russian. These varieties when left to become too ripe will shell badly." But be concludes, "no matter what the variety, it is good practice to allow the wheat to stand in stooks for ten to fifteen days and he recommends, if possible, that threshing be done directly out of the field so that the wheat will not have chance of sweating in the snow.

Treatment of Seed for the Prevention of Smut

All seed wheat, no matter what its source, should be treatd with the formalin solution in order to prevent smut. Use one pint or pound of 40% formalin solution, which may be obtained at any druggist and other stores as well, in about 40 gallons of water. The wheat may be put in sacks and suspended in tht solution to soak for five minutes, after which the grain may be spread out on the floor and dried. A simpler way is to pile the wheat on a floor and apply this solution with a sprinkling can, shoveling the grains over until all are thoroughly wet. This treatment will destroy the destructive smut known as bunt or stinking smut. It will not destroy the "loose smut", which, however, seldom does very serious damage. There is a treatment for this loose sfut known as the hot wat r treatment but it is a difficult and rather dangerous one to use.

How Much Wheat for Nova Scotia

According to our last decennial census, 12,152 acres of wheat were grown in Nova Scotia in the year 1910. The following table contains the number of acres per county:

County	Acres
Annapolis	201
Antigonish	1952
Cape Breton and Victoria	56
Cape Breton South	11
Colchester	1164
Cumberland	2891
Digby	6
Guysboro	117
Halifax	172
Hants	626
Invernesss	205
Kings	334
Lunenburg	63
Pictou	4362
Richmond	21
Shelbourne and Queens	2
Yarmouth	2

Since 1910 there has been quite a substantial increase in the wheat acreage which is now estimated by the Census and Statistics Office at Ottawa at 16,200 acres, an dby our own Department of Agriculture at Truro as nearer 20,000 acres. In comparison with these figures the Nova Scotia acreage in 1880, before the western proviinces were extensively opened up, was 45,045 acres, so that it would seem reasonable to expect that, at the present world's food shortage, the province should grow much more wheat than at present, although as already set forth, it would be a great mistake to substitute poor fields of wheat for good fields of otas. As a partial basis for an estimate of the possibilities, we may state that there are approximately 53,634 occupiers of land in Nova Scotia. Of this number, 1143 occupy one acre or less; 6227 occup between one and five acres each; 12,652 occupy between 11 and 50 acres; 13,278 occupy between 51 and 100 acres; 10.717 occupy between 100 and 200 acres; and 4,852 occupy 201 acres or over. It would seem reasonable to suppose that in a country where wheat grows reasonably well, every farmer in the last four classes should average at least an acre of wheat. Many now grow from three to ten acres each and these one would think, would make up, by their increased acreage, for those who will not grow any at all. On this basis Nova Scotian farmers would be making a very modest contribution were they to produce at least 41,499 acres for which there would be available ample land which was the previous year under some kind of a hoed crop. Even at that, the wheat production would seem small, amounting, at 20 ushels per acre, to a little less than 1,000,000 bushels, equal to about 200,000 barrels of flour. None the less this would be a substantial contribution which Nova Scotia might make toward helping out the food situation in these war times. To do it would mean the importation of a considerale quantity of seed for it is doubtful if there is more than enough seed on hand now than for between

Gardens Pay Dividends

when they are handled right, particularly now that everything eatable is so expensive.

Nothing is more important than the selection of seeds, and for this the safest guide is our new Illustrated Catalogue of

EWING'S SEEDS

No unworthy variety gets into this Catalogue—and no poor seeds go out to those who order from it.

Ewing's Seeds have produced forty-five successive and most successful crops in Canadian gardens and fields, and are ready now for the forty-sixth. Why not have a share in it?

Write now for this Catalogue, and if your Dealer hasn't Ewing's Seeds, order from us direct.

THE WILLIAM EWING CO., LIMITED
Seed Merchants, McGill Street, Montreal.

Ewing's Detroit Dark Red Turnip Beet

Valuable for its remarkable uniformity and smoothness; size medium; flesh rich red, fine-grained, tender and remaining so for a long time; admirable for either summer, fall or winter use. The tops are dark-colored and vigorous. One of the best varieties for the home garden or market and equally good to store for winter. Lb. $1.50, ¼ lb. 50c; oz. 20c; Pkt. 5c. Sent postage paid — cash with order.

Two Bushels to One Next Season—Sure

Let's help Food Controller Hanna double the food production this year. If you do your part, you will DOUBLE YOUR PROFITS. Doing something for your country and for yourself at the same time is good patriotism and good business. "Double Your Crops," you may say, "is very good advice, but how is it to be done?" We answer, "by using the very highest grade of Fertilizer," such as our "Best-by-Test" Brands. Consult with us about your soil and your crops and we will help you decide what is best to do. *Every pound of our Fertilizer is guaranteed.* We have full supply of all kinds up to full strength of analysis. We give special rates where farmers club together and order in car load lots.

"Best-by-Test" FERTILIZERS

Write for our FREE Booklet on PLANT FOOD. Live Local Agents Wanted.

CANADIAN FERTILIZER CO., Limited
14 Market Chambers, Chatham, Ont.

15,000 and 20,000 acres. Seed for the extra 20,000 acres would require about 40,000 bushels, which may be obtained locally and in the West if plans are quickly made, but which cannot be secured if farmers hold back their orders until spring.

Probably the increase will be less than we have set forth, but we have thought it owrth while to present a few figures, conveying some idea to those who may not have studied the question of Nova Scotia's possible contribution to the principal food crop of the world—wheat.

However it is not a consideration of the provincial crop which will count in this crisis. The practical question is what do you and your fellow farmers in your community plan to do. If you make your plans now, seed can be obtained. If you wait until spring, seed may be unobtainable.

Notes

1. Place your orders for your seed supply now.
2. To help reduce cost of seed and to ensure an abundant supply the Department of Agriculture have a policy to assist dealers to purchase car load lots. Correspond in regard to this with the Secretary of Agriculture.
3. At date of writing, the only reliable White Russian seed in sight is that which has been grown in the province. Those wishing this variety should try to buy from local sources.
4. Only limited suppplies of guaranteed Red Fife are as yet in sight. If you can buy locally, do so.
5. It is likely, as the trade appears that the bulk of the imported seed must be Marquis. This is now the standard wheat of the west and while it has not given universal satisfaction in Nova Scotia we have records from growers in Victoria, Pictou, Colchester and Kings Counties who have grown it several years and consider it the best.
6. Be sure to treat your seed with Formalin to prevent smut.
7. Fertilizer suplies are scarce and transportation uncertain. Buy now.

REPORT OF THE N. S. F. A. REPRESENTATIVES ON EXHIBITION COMMISSION FOR THE YEAR 1917

To the Officers and Members of the Nova Scotia Provincial Farmers' Association:

Your representatives on the Board of Commissioners of the Provincial Exhibition submit the following report:

The year 1917 has been marked as a year of very unusual experiences in regard to the Exhibition.

We entered on the year with what we considered bright prospects not only for 1917 but for many years to come. All interest seemed to realize as never before the importance of the Exhibition particularly in rgard to Agriculture and the importance of agriculture in regard to the welfare of the country in general especially in regard to the successful prosecution of the war. All the members worked in harmony; we also had the co-operation and assistance of the Halifax Board of Trade to a greater degree than ever before. The financial situation looked better than it had for some years, consequent on arrangements with the City and Government. We were acquiring more porperty with a view to rearangement of the buildings in the near future on plans to insure better accomodation and less crowding and improved conditions in all respects. These plans have received a set-back for the present on occount of the disaster to Halifax in which the Exhibition received its share of loss, all the buildings having been completely destroyed, but we are thankful that there has been on loss of life with our staff there. Manager Hall, although seriously injured, we are pleased to note is fast recovering and likely to be in his usual health in a short time. The Exhibition with the rest of the Halifax interests is bound to feel the effect of the disaster for some time, but we believe that we have good reason to feel assured that the Provincial Exhibition has a bright future before it, and recommend that every interest should be shown and every energy exerted to have it reopened under the best conditions and at th earliest possible datet.

As for the Exhibition in 1917, war conditions and consequent scarcity of farm help worked against us, but a more serious disadvantage than that was the unusual late spring and dry summer. These made it look discouraging, but when the Exhibition came on, we were pleased to find that the exhibitors had responded nobly and the buildings were well filled with exhibits which in most cases excelled in quality those of past years. In the Agricultural and Horticultural Departments this was particularly noticeable and we feel that great credit is due the Exhibitors in the Departments as the season was a most unfavorable one for them.

In the Live Stock Department, there was also a good shownig. In some classes the entries were not as large as they have been some other years, but in most classes the entries were up to the usual mark, and in all classes of live stock including poultry, the quality has never been surpassed in our Provincial Exhibition.

A particularly pleasing feature was the exhibit by the Agricultural College consisting of a number of their best horses and cattle which were on show during the Exhibition but did not come up in competition with privately owned stock.

The visitors showed quite an interest in the exhibit and we hope that the policy may be continued.

All the other departments were well filled with exhibits of the finest quality and were a credit to all concerned.

The racing was never excelled in the Province and was conducted on clean honest lines and proved very interesting to all classes of visitors.

The Midway came in for the usual amount of criticism, some of which may have been justifiable, but much of which, if actual conditions were enquired into would have been much better unsaid. While we make no attempt to uphold everything in connection with the Midway, it does seem strange to us why the Provincial Exhibition should be singled out and so much fuss made regarding the Midway while other Exhibitions and even institutions which claim to be exclusively for the moral and religious benefit of humanity recognize and uphold the same things and are permitted to do so without one word of protest.

The financial statement for 1917 shows:

Expenditures	$42,067.01
Receipts	38,159.99
Expenditures over Receipts	$ 3,907.02

This we consider a good showing especially considering that we had the imsfortune to have to practically rebuild the Grand Stand and put extensive repairs on the buildings and the fences, the result of a heavy wind storm.

In conclusion we wish to thank you one and all for the supoprt we received from you last year and especially those who patronized us as exhibitors, and again let us remind you that now as never before the Provincial Exhibition needs your best efforts.

Sgd. H. S KENNEDY.
H. W. FOSTER.

FARMERS AND DAIRYMEN HAVE INTERESTING PROGRAM

The Annual Meeting of the New Brunswick Farmers and Dairymen's Association, will be held at Fredericton from March 12th to 15th. The program is one of the best that the Association has had in years. The speakers will include men who are at the forefront in matters agricultural. Excursion tickets, one full class fare are obtainable on the Canadian Pacific and Canadian Government railways. The program is as follows:

PROGRAMME

Tuesday, March 12th, 8 p. m. City Hall

Opening Address—By President, Isaac W. Baird.

Address — His Worship Mayor Mitchell.

Reply—Vice-President, R. R. Patchell.

Address—Hon. J.F. Tweeddale, Minister of Agriculture.

Address—Dr. W. G. Keirstead.

Reports of the County Vice-Presidents.

Appointment of Committees.

RENNIE'S War Garden SEEDS

EVERY owner of garden space must help to grow food for his family this year, as a patriotic and personal duty. It is a vital wartime necessity. He must be doubly sure the seeds he selects will produce the most vigorous possible crops. In other words, he must plant Rennie's seeds, indisputably the standard of high quality, dependability and unquestioned purity. Rennie's War Garden Seeds are pledged to help win the war.

For Early Planting
We give herewith a suggestion of seeds recommended for early planting but study your catalogue.

TOMATO—BONNY BEST.
One of the Finest Early Sorts.....Per pkt. 10c.; oz. 60c.
CABBAGE—COPENHAGEN MARKET.
Best Round Head Early Variety. ....Per pkt. 10c.; oz. 90c.
CAULIFLOWER—RENNIE'S GILT EDGE SNOWBALL..... Per pkt. 25c.; ¼ oz. $1.25
CELERY—RENNIE'S XXX GOLDEN SELF-BLANCHING.....Per pkt. 25c.; ¼ oz. 75c.
ASTERS—RENNIE'S XXX GIANT COMET MIXTURE.....Per pkt., 10c.
PANSIES—RENNIE'S PERFECTION MIXTURE.....Per pkt. 25c.
PETUNIAS—RENNIE'S XXX RUFFLED GIANT MIXTURE.....Per pkt. 25c.
SWEET PEAS—RENNIE'S SPENCER GIANT MIXTURE....Per pkt. 15c.; oz. 35c.; ¼ lb. $1.00

DAIRYING.

MODERN COW TESTING

In venturing to accept your good secretary's kind invitation to address this convention on cow testing for perhaps the tenth consecutive time, I have been somewhat worried to find any legitimate excuse for appearing before you again. Possibly one explanation is the fact that the eyes of the world are today on the dairymen of Ontario, for they are just about as useful as the magnificent boys in the front line of trenches; today cows are appealed to as empire necessities, for our soldiers and babies find milk and butter fat as essential as wheat. Then too, we have the satisfaction of noting that a real endeavour, appears to be in progress, possibly the first honest endeavour, to arrive at the cost of milk, to appreciate it as a food and the great nutritive food value of all cow products. The nation needs every drop of milk that can be produced; it has no substitute.

Every dairyman knows that with fair feed prices and fair labour costs he can make more on milk than he can on beef; the cow is worth three times as much as a milk producer as when turned into meat.

So once again we have tried to dig into a mass of 205,000 individual cow records received at the office during the year, to see if figures talk in dual language, and if they can be translated into any worth-while suggestions for modern work.

May we first remind ourselves of the significance of the intimation that the French government wishes to purchase one million cows from this continent as soon as the blessings of peace are ours once more. The stage is being set for big business, in which cow testing is to play a star role. France will not want poor milkers, but will assuredly want to buy from men who have saved every productive cow, and her promising heifer; remunerative prices will be obtained from these purchasers who will ask for records of milk and fat production.

Does it pay to keep records? At a recent auction sale two herds of equally well bred cows were put up; one lot, with no records, averaged $145.00; the other lot, with records, fetched an average price of $303.00, more than twice as much. This is a second indication that it pays in these modern, busy times to regard cow testing not as a mere unimportant incident, but part and parcel of one's main occupation.

Arising from that is this thought, a man here and there may be overstocked, others need more; might there not be established on this as on the other side of the line, dairy cow exchanges, whereby every useful cow could be placed with some farmer who wants her, and so halt the weary procession to the slaughter house? Surely we are scarcely acting wisely when cows giving upwards of eight thousand pounds of milk are being sold for beef.

Closely connected is the exchange of good pure bred dairy sires, advocated so frequently, for it is good modern policy to save not kill them before their real value is known. Just recently $1,000 was offered for a fine prepotent sire whose worth was undiscovered till he was simmered down for beef extrace. Are we not literally and entirely dependent upon that marvellous ingrained feature of heredity in the pure bred, ability to transmit producing quality? One of our recorderers kept track of the performance of daughters of two pure bred sires of the same breed in one small district and found a difference of almost $600 in the value of the butter in one year. Let us save those good sires.

Is the modern dairyman to risk any kind of pure bred sire before time discriminates dairy merit; or worse still, should he use a grade You remember we have an Ontario law against a grade stallion, it is but a step now towards regulating scrub dairy sires. Let us remember we cannot expect improvement from the grade, we rightly demand it from the pure bred. Our recorderers in 35 districts report that out of a total of 5,620 sires in use, 47% are grades, and out of the remaining pure breds, one-third are poor, undesirable. We need more foresight.

We all know that the richly bred sire, presenting finest individuality combined with extreme dairy capacity, a triumph of the Canadian breeder, is worth big money (he can be purchased cooperatively or obtained from the department) when records show that he has forty or fifty daughters that have given over 2,500 pounds of milk in a month, or when mated with grade cows he has far more than doubled their yield of fat in two generations; so, plainly, the modern dairyman can scarcely acord to overlook the importance of this factor as shown by dairy records.

But may we consider more particularly the value of cows as disclosed by a few figures kept on farms. Four mature cows in one herd gave only 2,337 lbs. milk and 78.5 lbs. fat apiece during the year; they are described as "no particular breed, but red in colour." Perhaps these cows had no chance, possibly the owner is not naturally adapted to animal husbandry, he might make a good blacksmith or bricklayer.

Our supremest energies are needed today, we cannot afford to fuss and fritter with the three thousand pound cow. Such owners appear adrift on an ocean of unbelief regarding true values.

But here is a different record, where the owner is injected with a good dose of optimism, ten cows each one giving four times as much milk and fat as the above four, and still better results quite expected.

It appears that the most successful dairymen are those who display most sympathy with cows of fine quality, records indicate a cow's needs and preferences in such matters as care, feed and attention; and the more that these two features of her life—the literal self-sacrifice of a good cow in the breaking down of her actual cell tissue to make milk (as distinguished from the selfish storage instinct of the beef type) and then her wonderful, unceasing, hourly service for humanity—when these are appraised by the true dairyman, who is always of fine quality, then the more eager will both men and cows be, mutally, to do their very best. It is a simple equation, sympathy plus sacrifice equals larger service. Again and again, in support of this, our records indicate that with only slightly increased feed, but with far better care and attention, the yield is increased.

Then we find this kind of thing, two cows in the same herd, same age, fresh the same week, and one giving eighteen or twenty-four hundred pounds of milk more than the other. This lays stress on one main object of record work, useful comparison, power then to distinguish between cows that do not respond to their increased opportunity, and those that are the willing servants of thoughtful owners; to discover those that are the more valuable on account of the human sustenance they furnish in excess of what only an average cow does; for that bit extra, that additional weight, that plus quantity, voluntarily given as increase above the normal or expected is of special value. It heaps the measure full of welcome profit; indeed as it is obtained either per acre or per cow it is the distinguishing mark of the good farmer, the modern dairyman, not merely the keeper of cows. The extra feed, the better care frequently have returned twice the original cost. We have several cases where extra feed to the value of only three or four dollars gives additional milk valued at $15.00. A clear cut case at one of our record centres shows that extra feed, more clover and more meal, valued at $605 given to 100 cows, produced over $1670 worth more milk. That is worth noting, it was no gamble, but an investment that paid one hundred and seventy per cent.

When total income from any herd, or any one cow is only at a medium level, unless expenses are remarkably low, the resulting profit cannot be in keeping with the just deserts of the modern dairyman. If a cow's total product of fat is worth seventy dollars and her feed is valued at sixty-five, does the clear five dollars pay? We naturally say that so and so has a "good" business, or that this is a paying investment as the interest or net profit is high. The large turnover, either with matches, mops, or milk does not necessarily mean a paying business, often the growing expenses quickly devour income leaving a bare skeleton of profit. If you prefer to think in large figures you may recall that the newspapers recently stated the G. T. R. in a certain period had four million dollars more as gross receipts, but the net earnings were three million dollars less.

So we find cows in the same herd producing almost identically the same weight of milk and fat but vary in very marked degree in the value of the feed consumed, and on no war time menu either, with the result that in many cases the profit is double.

Manifestly therefore the dairyman of good business instinct is able through dairy record work to select cows that not only bring in good money, but that return a respectable profit above a reasonable charge for expenses. We want the willing cow, but again selected, willing to work profitably herself, not too willing to let others ro it for her.

Great satisfaction from dairy re-

Profits in the Milk Pail
Your cows will milk heavier and produce milk with a higher percentage of butter fat when given
Pratts COW REMEDY
Full milk pails mean more profit for YOU. Richer milk means more cream—more butter—more money in the bank.
Begin right now with PRATTS. It puts your cows in prime condition, makes them relish their feed and digest it fully. Costs but one cent a day per cow, and pays for itself many times over in the extra quantity of milk obtained by its use.
At your Dealers' in pkgs., in 25 lb. pails and 100 lb. bags.
Money Back if not Satisfied

PRATT FOOD CO. of CANADA, Limited,
68F Claremont St. Toronto. S-2

Royal Purple Stock Specific

This concentrate stock tonic, blood purifier and food digester is made from pure ingredients and contains no filler. It aids digestion to such an extent that food which would otherwise be voided and lost is turned into muscle, fat or milk, as the case may be. Try Royal Purple Stock Specific on your poorest, most rundown animal. It will give you surprising results.

This Great Animal Conditioner

will enable you to fatten a horse very rapidly, because all the nourishment is liberated from the food.
DAIRY COWS give 2 to 5 pounds more milk each daily when fed Royal Purple Stock Specific. It also improves their physical condition.
Mrs. Fred Bush, Wainfleet, Ont., writes us as follows:
"I have tried Royal Purple Stock Specific in feeding cows. Weighed one cow's milk, and find a great gain in ten days' time, also a great improvement in cow's condition. Order Royal Purple from your feedman. It is sold in large and small packages.

FREE BOOK
We will gladly send you our 80-page book, describing the common diseases of stock and poultry. It tells how to build poultry houses and feed calves without milk. Write for your copy.

cords comes in the avoidance of putting in time working for unprofitable cows, and the enjoyment of more cash and larger profit from selected individuals. It may be that a large income is obtained at too great an expense, we cannot afford to pay too much for income.

Some of the records we receive show big things being done, $200, $250 or more being earned per cow, one group of 180 cows giving a million and a half pounds of milk, bringing fair reward for the owners' investment in feed. But whether all his weary hours of time, his hard labour, his unflagging energy, his superior talent, evidenced in careful thought, wise forethought, and matured planning have been suitable rewarded is quite another question. Especially is that true today when the general public is obtaining a glimmer of light on the question of the time put in gratuitously by farmers and farmerettes, the families of dairymen, their wives and daughters, and how much good brain power it takes to run a dairy farm profitably.

Records indicate great possibilities. Looking at two districts we find that 250 cows in one gave a total yield more than the same number of cows in the other district of 170,206 pounds of milk. Another comparison shows that if 500 cows in one locality had done as well as 500 in another, there would have been an extra yield of 48,-015 pounds of fat. Great savings may be effected and larger incomes assured when dealing with the selected, real dairy cows.

If in modern dairying with experienced men dependent on milk for income we still find differences of $40 and $60 gross revenue between two cows in the same herd, it makes one stop and think. Is it possible to locate exactly just what it is, definitely, that makes two cows that look alike, are alike, as far as practiced, expert eyes can see, act in such radically different fashion at the pail? Is there some hidden principle in the blood? Perhaps a scientist by patient analysis in a laboratory will discover it.

Cow testing is bound to spread because it has the right foundation, the genuine desire to advance the cause of dairying through cooperative united effort; members are working to build a greater and better dairying industry, better farms, better cows, improved farm life. There is imperative need for more and better cows for the welfare of our own and other nations; cow testing will help to select the best and to maintain good herds. Rapid increase is dependent on the hearty cooperation of the individual farmer and everyone who can run a Babcock tester. It cannot be had cheaper than at present, costing the dairyman simply the price of scale, bottles, and dipper, beyond that not one cent, for the Department pays for the testing and does the figuring. In the United States today there are over eleven thousand farmers gladly paying $1.50 per cow for having two hundred and twelve thousand cows tested.

Are we at present on an economically sound basis when we still harbour the poor cow? It has been stated authoritatively that many industries do not realize twenty per cent of their possible capacity; can we "speed up" milk production I firmly believe we can. Canada has a heavy debt; but the wonderful dairy cow, selected, can be relied upon to assist in its liquidation. One might plead to give the cow the best possible opportunity. She may have an inclination to work better than her natural pace. She can work faster without tiring, and if properly trained and given adequate inducement, will adopt the faster pace and make it a habit to work at that faster pace, which may be called the proper pace. This marked individuality and possibility of development in cows of the same breed is well illustrated by the fact that the full brother of a trotting horse, world-famous, is at city work and has no pace better than a walk.

Then, too, the good cow may have ambition, far more than we commonly suspect; she is not like the negro down south, who if normal wages are one dollar per day will work daily for a week, but if wages are two dollars a day, will lay off half the time—he is not ambitious either to accomplish or save. Neither is the cow lazy, either physically or mentally; for all we yet know she may be thinking up better methods. We may rest assured that the cow is not thinking that by doing efficient work she will be displacing other workmen and lowering wages. The point is that she is a most excellent master craftsman and is clearly, logically entitled to the best possible opportunities that skilled, scientific, common sense management can provide. A cow is just a cow, true, but because our senses have been somewhat dullel in time past with low averages, poor yields, there is no necessity to keep our feet on the treadmill of the what-has-been, or refuse them the pleasure of the what-might-be. Development, herd improvement, are giving us yields today that but a few years ago would have been thought impossible. Pick up any dairy paper today and some new record is made; collect such, and it is not hard to find 40 or 50 cows that gave over a thousand pounds of fat each last year. Just consider what a wide door is open for Ontario dairymen, for if the first ten thousand cows you come across were averaged it is doubtful if they would be found to give two hundred pounds of fat.

Note where men are keeping track of weights and tests and you find their cows are head and shoulders above the average yields of the township or county, twenty-five dollars or more per cow. Where records are kept the herd shows improvement, where the farm and the cows have a poor appearance it is probable the owner is not weighing and sampling; but where the scale is used and the record sheet is studied, there, on every such farm, you find the milk yield per cow steadily climbing, four thousand pounds one year soon made six thousand, the one hundred and fifty pounds of fat made into two hundred and fifty; elsewhere you note the yield is up to the eight and nine thousand pound level, or may be the figures are in the fourteen and fifteen thousand pound class (I am quoting actual records) and three and four hundred pounds of fat per cow, with one hundred dollars or more clear profit per cow above feed cost, and a return of two dollars and a quarter for every dollar spent for feed.

Please note this obvious fact, so obvious indeed, that one is apt to overlook it, men are absolutely dependent on figures to substantiate the bare statement that the cows did well, records are the necessary proof that the yield is high. Without the figures one is lost in a mist of uncertainty, but the beacon light of dairy records leadas positively to solid and lasting herd improvement.

Three Important Reasons For Buying a

NEW DE LAVAL

CREAM SEPARATOR

At Once

THERE are three very strong reasons for the immediate purchase of an up-to-date De Laval Cream Separator.

In the first place, a new De LaLval machine will now save its cost in a few months—in more and better cream and butter and in time saving—at the present very high butter prices and great need of every minute of time.

In the second place, the patriotic duty rests upon every producer of butter-fat to save every ounce of it, and nothing is of greater food value to a nation at war. All European countries are encouraging the sale of the best cream separators in every way possible.

In the third place, railway delays are such that you can't depend upon quick delivery, and if you don't order your De Laval now there is no telling when you can get it. Moreover, the supply of labor and material is uncertain and all last year De Laval deliveries were nearly two months behind.

Again, De Laval prices have advanced very little thus far but must go higher if present industrial conditions continue, let alone become more difficult. Present prices hold good until March 1st only.

There was never a time when the immediate purchase of a latest improved De Laval Cream Separator was more important to everyone separating cream, or when it could less wisely be delayed.

See the nearest De Laval agent at once. Arrange to try a new De Laval machine for your own satisfaction. See for yourself just what it will do for you. If you don't know the nearest agent simply address the nearest General Office.

THE DE LAVAL COMPANY, Ltd.

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA. Sole manufacturers in Canada of the famous De Laval Cream Separators and Ideal Green Feed Silos. Alpha Gas Engines, Alpha Churns and Butter-Workers. Catalogues of any of our lines mailed upon request.

MONTREAL PETERBORO WINNIPEG VANCOUVER

The making of a classification has been said to be the beginning of wisdom. Certainly without it, accurate records are impossible, where there are no records business does not prosper. Records are indispensable insuranace against mistakes, failure of memory and against general human fallability. An ounce of knowledge is worth a pound of guess.

The more that the welfare of the dairy cow is considered, the more important does she become in our estimation. She is working up for humanity's needs, in the most economical way, those natural resources which without her would be valueless. May I remind you how she dove-tails into the very foundations of our well being; for the mental and physical welfare of individual members of society are recognized as dependent largely on three factors, the natural resources, the tools and methods of production available to develop those resources, and the knowledge and organization whereby the fruits of labour may be fairly and equally distributed. All these are embraced by Cow Testing.
